tion of this is on very thin soil where bare rock is exposed and on wet land, but even so
it does show that much more of the land might be under cultivation or improved grass.
[118] The decrease in cultivation since the late nineteenth century is probably much less than
that for the Valtos area of South Uig where about 70% of the inbye and outrun is under

permanent grass. The pre-eminence of the Carloway area is then only a relative one where the decline in cultivation is taking place at a slower rate. Isolation, the decline in fishing and the lack of alternative employment leading to a greater decline in population may explain the more rapid decline in the Valtos area. Whether Carloway will see a similar decline remains to be seen.

Table 35

Stock carried as a proportion of total soum of each township - Carloway district, August 1959

TOWNSHIP	All Stock	Cattle	Sheep*
Carloway	63%	53%	70%
Carloway Park	87%	64%	119%
Borrowston	74%	15%	121%
Garenin	97%	30%	160%
Knock Carloway	64%	30%	90%
Kirivick	73%	25%	124%
Dun Carloway	104%	21%	187%

* As recorded in some cases these figures are too low (see Appendix C (2)); the maximum error is probably around 10%.

Table 35 summarises the agricultural system; further details of the relations between size of unit, status of tenant, stock of cultivation, will be found in Appendix C (3), (4), (5) and (6). Though the total soumings (that is the conversion of both cattle and sheep units to 'cow units' expressed as a percentage of the souming) never fall below 60% the sheep souming is exceeded in five townships and that grossly in two cases. Once again however this is not as serious as it is in the Valtos area where soumings are exceeded by up to three times the figure allowed. Nor does the mere statistical analysis reveal all the picture for it is essential that a proportionate number of cattle be kept so that the grazing of both cattle and sheep may regulate the growth of the grass. As it is, the relative and absolute increase in the numbers of sheep is having a serious effect on the quality of the pastures.

Sheep are given less attention that the cattle whether they need it or not and few of the present generation are prepared to tolerate the life of the shieling in its old form where the cattle were taken in the summer. In consequence the grazing on the outer moor is almost entirely given up to sheep. The shielings are now only marked by small broken stone mounds which were once the shelters and by the small surrounding areas of greener sward. The changing aspect of the hill landscape has already been mentioned.

Comparison of the totals given in Appendix C (1) shows how the present pattern is developing. 167 milk cows are being raised on 171 agricultural units and with these are 113 calves. Appendixes C (5) and C (6) indicate that the agricultural unit farming the basis of farming is the single milk cow and annual calf which carries a subsidy if it passes the inspector of the Department of Agriculture. A few crofters are raising young beasts for sale but there is a general unwillingness to grow more fodder to raise cattle for an uncertain market which may be affected at any moment by an increase in transport costs which are already high. Without the subsidy such enterprises would hardly be possible at all and indeed one could say this of many aspects of life in the island today. Some of the calves are wintered, but the usual practice is to sell off late in the year.

TOTALS:	[illegible]	39	419	516.5	[illegible]	[illegible]	[illegible]

1. A legal croft is any piece of land registered as a croft - a township may consist of two or more crofts. There are 415 townships.

2. Cottars, feuars, squatters with stock.

3. An agricultural unit is defined as any unit, whether a legal croft or a number of legal crofts owned and/or sublet, or a cottar, feuar or squatter having stock. Agricultural units may include crofts in other townships worked from the home unit; the gross and grossings of such crofts are added to the township

from which they are operated and subtracted from the township in which they are situated.

4. See page 5 for definition.

5. Some tenants in the townships of Deaforthmead and Ehlidennish, Rabnott, Barnhamber, Garryward, rent grazing in Park Deer Forest and therefore this stock is not related only to their respective Duncan Fergure Dowings.

6. Arable and outrun are not statistically differentiated; in the totals, the proportions of arable to outrun in the other townships have been used.

/ Section p. 8 /

[Gryvard]

Only a fraction of the total arable land is cultivated by tractor and this is divided among seven crofts. In spite of an emphatic statement by one of these cultivators to the effect that he will never use it again, the use of the tractor will increase as soon as the pioneers are able to prove to their neighbours its capabilities and as soon as the lazy-beds are joined together, an improvement which has already taken place in Habost. The main objection to the use of the tractor by the disappointed user was the inevitable one that the yields were smaller than in former years when he had used the spade. The answer to this was given by one of the other pioneers, who thought that time saved could be devoted to some other profitable occupation, for example, weaving. Six of the crofters practise a five-year crop rotation, sowing potatoes first, followed by oats under-sown with clover which for the following three years is cut for hay.

An interesting experiment has been that of the improvement of two acres of common grazing land by the road on the west side of the township, by nine of the crofters working together during the evenings. The work began early in Spring when 6 tons of lime, 10 cwts. of mineral phosphates and 8 cwts. of compound fertiliser were spread evenly over the land. The grass seed was sown in July, the most favourable time for sowing since there is less danger of a drought than earlier in the year, and more convenient too, in that the sheep had been gathered for shearing and 250 of them were available to be driven back and forth over the land to tramp the seeds in. In theory this land should be ready for grazing next Spring, but in practice it will be ready in November. It is planned to re-seed twelve acres in all.

Most crofters have a cow to provide milk for their own needs. The Black Poll bull at Gravir is preferred to the other township bulls since its progeny command higher prices. Sales are held in the district twice per year, once on the old late-level on the east side of the township, and once at Baiallan. Prices for calves are normally better in Spring than at the Autumn sale, nevertheless prices offered tend to be low. Even so, it is usually to the advantage of the crofter to part with the animal rather than bear the cost of taking it back to the croft and wintering it there. Naturally there is some bitterness that the middlemen who buy these animals will sell them at much higher prices on the mainland at Dingwall. Sheep are normally sold in Stornoway to the butchers but also at the local sales.

Crofting is not in itself a lucrative form of employment and in most households there is at least one other source of income. A majority of the crofters have regular employment, two working in quarries or on the roads for the County Council, another is postman, three are weavers, another both weaver and contractor, while yet another works in Antarctic waters aboard a whaling factory ship for eight months of the year. Weaving is undoubtedly the most lucrative of the ancillary occupations, though the weavers are suffering at the moment from the slump in the Harris Tweed industry which is also affecting the prices for wool. Contracting is also a paying proposition for one or two persons only, since the amount of freight is obviously limited.

Most crofters own a small rowing boat and it is not uncommon to see half a dozen nets set to catch mackerel and other demersal fish. There is not one large fishing boat, however, partly because of the scarcity of fish near the coasts, and partly because of the isolation of the area and the subsequent difficulties in marketing. The Stornoway trawlers do not operate in the Minch, and one has to its credit the destruction of two long lines - the sum total of the tackle belonging to a local boat. To have eighteen pounds worth of gear lost in one night is ruin to a crofter-fisherman. Lobster fishing has died out at Garryard though it could be quite extensively practised.

The main road from South Lochs to Stornoway through the village has obviously had a profound effect on the township. The sites of the old 'black houses' have been abandoned when new houses have been built, in favour of sites conveniently near to the road. The Road Age has greatly limited man's capacity for carrying goods. This is well illustrated by the fact that the majority of crofters in Garryard use artificial fertilisers, whereas they are scarcely used at all in Caversta where the road ends about 50 yards from the nearest house.

[Caversta]

Each croft is fenced but has a gate giving access to the common grazing, in which each crofter holds an equal share. The township has no specially enclosed area for lambing or other purposes and no fixed date exists on which the crofters open their gates for winter grazing. Breeding ewes are normally brought in at the topping in mid-October and December when crops have been gathered, and lambing takes place in late March or April. After dipping and inoculation with vaccines for black leg, braxy and louping ill, the sheep are put out on the common grazing in the second or third week of May.

The 642 acres of common pasture support a sheep stock equal to the sheep sum, but the overall stocking is only 88 per cent of the total sum. Two crofts only exceed their individual sums, while the others are well below the number required for greatest efficiency. The grazing is, however, poor for summer pasture, owing to the lack of grass, but the heather is valuable for wintering the sheep. Lewis Blackface sheep are the predominant breed and the wool, clipped in July, is sold to the Stornoway mills and the animals themselves are sent to the slaughter house. The 1958 loss at lambing was exceptionally high owing to a cold, dry spring preventing the growth of grass for the ewes. More than forty lambs and thirty ewes were lost by the township last winter, a number four or five times greater than the average loss.

Six cows, two heifers and four calves are kept in the township and tethered most of the year on the crofts. Calves are born throughout the summer months, but whereas early-born calves may be sold in the Autumn at six months old, those born later must be wintered to eight months until the Spring sales. The cows are served by the Department of Agriculture Highland bull at Habost, but although good prices are obtained for beef cattle, it is felt that for the family milk supply, a dairy bull would produce a better strain.

In addition to keeping stock, oats are cultivated on five holdings and potatoes on six. In most cases the land under each crop is less than half an acre and nowhere does it exceed two acres. The lazy-beds have been built up into broads about six to ten feet wide, separated by open drainage channels and worked by the spade. There are only two holdings where a tractor (hired from Habost) is used and the acreage cultivated only amounts to three-quarters of an acre. Conditions are not altogether favourable for mechanisation at present, for the terrain is very uneven and broken up by marsh and steep faces of bare rock.

Neither Toriota nor Caversta is on a main road. The former is served by a track joining the road near Cromore, while the latt: has a secondary road running as far as the township dyke, and an inferior footpath joining the main road at Garryard. The lack of a good road within the dyke acts as a deterrent to the use of modern equipment and fertilisers. Byre manure is used on all the crofts and seaweed is brought from the shore and spread on the lazybeds. Artificial manures, used on only three crofts, must be carried over rough ground from the dyke. This lack of incentive to improve is perhaps even more marked by the fact that on one holding alone is a rotation practised - potatoes, oats undersown with clover, then hay for three or four years. Apart from this one instance, potatoes and oats are sown, perhaps alternately, on the same strips for many years. Natural grass yields the bulk of the hay and is often cut from lazybeds that were formerly cultivated. On one croft there is upwards of quarter of an acre where the old ridges can be seen to have a crescentic shape and are thought to date back more than two hundred years. A short distance beyond the township dyke is a similar stretch of land, now colonised by heather.

Peat still forms the principal fuel and, apart from one half acre patch within the dyke, is cut on the common grazing, as near the road as possible in May and June, and later brought home by creel, bicycle or tractor. Three of the six operative units still have gardens and all keep up to twenty chickens; rowing boats for line fishing, solely to supplement the larders, are also maintained.

In 1841 population records show that there were twenty-two persons at Caversta and seven at Toriota. After 1881, when maximum figures of fifty-nine and nineteen were noted, there was a secondary peak in 1911 in Caversta, followed by a steady drop to twenty in 1951 and eighteen in 1958.

[Cromore]

The crofters sowed clover with their oats in 1957; the quality of most of the natural grass could be improved considerably by extending this practice. Several of the crofters have taken advantage of the facilities for obtaining lime and fertilisers, but seaweed and byre manures are widely used. Only seven crofts have vegetable plots this year but that of No. 23, (partially enclosed by a dry-stone wall) has produced crops of lettuce, cabbage, turnips and carrots.

The souming for Cromore is one cow, one heifer and eight sheep per £1 rental, but is not enforced. The crofters keep the stock which they can manage to maintain through the winter and no one appeared to be dissatisfied with this arrangement. In fact the souming is exceeded by only seven crofters and the total stock for the township is only 75 per cent of the souming. Lambing takes place in April and May and often a high proportion of ewes and lambs is lost. The sheep are clipped in July and each crofter usually clips his own flock. The crofter sells the fleece or has it spun in Stornoway before weaving it himself. The lambs are taken from the ewes during the second week of August and then dipped. November is the tupping period and almost every crofter had his own ram. Most crofts have a cow and a calf and the crofters like the calves to be born in March so that they are six months old in October for the Garryard sales. The cows are served by an Aberdeen-Angus bull from Croisg Farm. The township gates are opened in October and the cattle remain within the bounds until May. An interesting regulation enforced by the Grazings Committee is that each family can have only one dog, and that it cannot be taken on to the Common grazing without special permission, or on lank days.

Shielings, situated on the common grazing between Calbost and Cromore, were used until the 1890's. Active land use has gradually declined; in the 1920's, much of the outrun was under cultivation and from an air photograph, it is evident that hay was being taken on the strips above Cromore in 1946. The present trend is a continuing decrease in the amount of arable land but this year ten crofters formed a group to enclose and improve a ten-acre plot on the common grazing. It is unfortunate that all crofters were not willing to take part. Peats are now being cut near the road between Caversta and Gravir, about three miles south-south-east of Cromore and one mile north of Gravir.

Cromore was once a prosperous fishing village but now it has no fishing boats. Two Cromore fishermen work on other boats (one from Marivig and one from Stornoway) and there are a few men who would welcome the opportunity to start fishing again. There seem little prospect of this, however. The landing-stage, completed in 1957, is regarded by many as a 'white elephant' and, in fact, at low tide it is useless. So much for the hopes that it might have been used by cargo vessels bringing goods to Park.

In Cromore there are fourteen looms for the weaving of Harris Tweed. Tweeds are obtained by road from two mills in Stornoway and one in Airidhvouich. At present the average production is only one tweed per loom per week but the weavers could quite easily double their production. During the past year there has been a considerable increase in the demand for tweed. Knitting is a winter pastime but only for pleasure, although one household possesses a knitting machine.

In common with the rest of Park, Cromore has a high proportion of old people. Many from the middle age groups have sought employment on the mainland, and the teenagers, many of whom have been at school in Stornoway, seek jobs there or on the mainland, returning for holidays and assisting with the croft work. Some younger folk are resident to care of aged parents.

Cromore is only eight miles by sea from Stornoway yet all communications with the town are by road a distance of thirty-two miles. There is a daily bus service and the sub-postmaster has a van which is occasionally hired. Some people recalled that the only route to Stornoway was once by boat to Crossbost and thence by bus. One resident owns a lorry and this is used for most of the haulage in Cromore, particularly for bringing home peats during the summer. As a result of recent additions to the roads, only three crofts remain inaccessible to vehicular traffic. There are no shops in Cromore but grocery vans call on Monday, Tuesday, Wednesday, Thursday and Saturday.

[Marivig]

There are only fifteen cows, two yearlings and four calves in the township, and the crofters with no cow rely on neighbours, or on tins, for their milk supply. All but two of the crofters keep sheep; there being four hundred and eleven ewes, one hundred and eighty-five sheep and two hundred and thirty-four lambs belonging to the township. The common grazing (including the off-shore islands which are grazed by five different crofters each year) is used for the sheep in summer, while all but one of the crofters winter their sheep within the township dyke on the crofts. Most crofters keep hens, and surplus eggs are sold to the Stornoway vans.

Peats cut on the common are transported by lorry to the croft, while peats from the north end of the peninsula separating Loch Marivig from the sea must be carried in creels.

Nearly every crofter owns a rowing dinghy which is moored in the loch off the end of his croft, and with this supplements the family food supply. One herring boat, operating nightly from Stornoway and returning to Marivig at weekends, is all that is left of a fairly large fleet which operated before the war. A second boat, unused for two years, lies shored up on the beach, and two others are wrecks. Over fifty years ago there was a curing station at Marivig. One crofter fishes lobsters during the winter and markets them in London.

Of the other crofters, only two supplement their incomes by weaving, one by working on the roads while several men work partly on the crofts but are periodically away working in South Georgia, fishing, or on hydro-electric schemes. Several others are in the Merchant Navy. The gradual migration from Marivig, especially of the young people, is reflected in the high average age of the permanent residents, and in the numbers in the school - over one hundred pupils in 1900, thirty-nine (including sixteen from Calbost) in 1946; but only nine (none from Calbost) in 1958. The young people leave the township to train or work on the mainland (generally in Glasgow) or in Stornoway, while their elders accept the view that 'there is nothing for the young people here'.

The township has a Post Office and telephone kiosk which also serve Calbost, while lack of a pier, also a partially compensated by a choice of four vans from Stornoway and one from Gravir. There is a daily bus from Gravir via Marivig to Stornoway and back: the return is over 10/-. The road which reached the township from the west in the late 1920's has a tarred surface and is much better than the later road southwards to Gravir which is untarred. There is no church in Marivig and most of the population attend the Free Church in Gravir.

Within the township the two arms of the township road serve all but two of the crofts and the sites of the newer houses, few of them more than thirty years old, tend to be near the road, while the ruined houses found on most crofts are often nearer the sea. Only two thatched houses remain and the other inhabited houses are built of stone roofed with asbestos slate, or of corrugated iron. All the crofts are supplied with electricity from the grid, but very few have a piped water supply; rainwater is collected from the roofs and piped for washing, with a separate piped supply from a well for drinking. All other houses draw water from wells.

The stormy winter weather, rocky terrain and poor soil are all blamed by the residents for the drift of population away from the crofts, but those who remain have little incentive to work the crofts more efficiently owing to the very hard labour involved. It is suggested that with more intensive cropping and more cattle, each croft could make a comfortable profit and surplus milk, potatoes and eggs could be marketed in Stornoway - the milk replacing tins of evaporated milk from the mainland. Such development, perhaps on a co-operative basis, together with a revival of the fishing industry and introduction of a tourist industry, by building a small hotel or guest house and attracting anglers as well as those who simply wanted scenic beauty, might bring prosperity back to a township which otherwise may well be derelict in the next twenty years. But the capital required for the two latter enterprises is not available within the township.

[Calbost] [Gravir] [Glengravir]

There are only 17 people living there at present, seven of whom are squatters and only eight houses are occupied within the dyke. Of the male population, there are three children under fourteen year one man in the 15-44 age group, three between 45 and 64 years and two over 65. This clearly shows the lack of active men from 15-44 years, necessary for the continuing economic success of the community. However, even these figures are not so striking as the numbers of emigrants as no less than 39 men and 40 women have left Calbost since 1939.

A community of 120 persons has shrunk to less than 20 in only twenty years as the younger people have left to find employment in Stornoway and on the mainland. The present population structure seems to indicate a continuation of the downward trend.

GRAVIR AND GLENGRAVIR

Gravir, the largest Park township numerically in population and crofts, lies astride the major east-west road, the Gravir-Garry Ostern, a glacially modified line of structural weakness. The site of the township is perhaps the most picturesque in all Park, but the steep slopes, lack of cover, the small area of good arable land, and the considerable population existing on slim resources, problems common to Park as a whole, are all epitomised in Gravir.

On the south-facing slope above the loch and the continuation of the trough in the valley to the west, the majority of the crofts have been carved from moor to sea, some before 1800, and some in the process of the abolition of run-rig which was accomplished in the years 1850 to 1852. Originally, there appears to have been thirty crofts, but four were added during the nineteenth century, two at each end of the line, and in 1934 a further fifteen were cut out of the common grazing, a mile to the west of Gravir. On the south side of the loch, the 'clachan' of Tom an Fhuaskie established about 1800, has since developed into a further nine crofts. Thus there are forty-three legal crofts in Gravir and a further fifteen in Glengravir making fifty-eight in all.

The layout of Glengravir, a line of crofts from 3.6 to five acres, typifies the small post-1918 Department of Agriculture holdings. The arrangement of the Gravir crofts is different as indicated in Figure 4; and it will be seen that not all the crofts are consolidated. There are three areas of former arable commons which have been lotted in unfenced strips and they may well be reminiscent of those which were necessary to supplement the food-producing capacity of the holdings. The method of distribution and allocation speaks of a period when a subsistence economy under severe pressure from overpopulation necessitated 1800 lazy-beds for all. The last of these commons was in cultivation until 1891. Although subsistence crofting has been obsolete since then, there is as yet no move toward a regularization of the layout.

The congestion which necessitated the reclamation of the arable commons developed mainly as a result of a successful fishing industry which prospered from 1860 to 1914 and at one time there were two curing stations in Gravir. With relative prosperity came an military industry, cottars were brought into the township and the population rose from 197 in 1830, to 368 in 1881 reaching a peak of 411 in 1911. The collapse of the industry after 1914 began the downward trend which has certainly not yet ceased. Gravir was visited from 1918 to a township of agricultural labourers and a few crofters, but the hopes of a revival of fishing activity since.

Stock raising is now the function of the township and the agricultural resources and conditions are hardly conducive to the development of economic holdings. The Gravir and Glengravir crofts vary between 3.5 and 26.5 acres in size: no croft has more than four acres of 'old arable'. In the days of subsistence agriculture, and indeed until the 1930's, cultivation, all in narrow lazy-beds, was backed up with stones at the downward extremity on the steep slopes, was much more extensive. All the cultivable land was at one time under crop, heavily manured with seaweed cast far away. At Cromore on the coast south of Rubha Hisaf. About one-third of the maximum lazy-bed area is no cropped and the more inaccessible areas of the crofts have reverted to pasture; some of the lazy-

[Gr-vtr] [Glengr-vtr]

beds are now covered by sphagnum moss and heather. Other lazy-beds are permanently in natural hay; only thirty per cent of the land classified as 'old arable' is now in oats and potatoes. If natural hay is added, one hundred and thirteen acres of crops are taken from an area greater than the so-called old arable; this suggests that the cultivated area was pushed beyond the limits of the old arable (ninety acres) after 1850-52. As in all the fishing townships the area of sown grass is infinitesimal for only four of the fifty-eight operative units actually sow grass. The wintering capacity of the crofts could be greatly increased by the general adoption of the practice of under-sowing.

There are forty-three legal crofts in Gravir but nine are sub-let, in every case to relatives. All the crofts are taken up and there is evident pressure of population on the land. In addition to the crofts, there are a further ten cottars, and squatters and feuars, besides the fifteen legal Glengravir crofts (ten operative units) which have no share in the Gravir common. The common has been encroached on by several feus for Gravir is the functional centre of Park: the Free Church of Scotland and Manse, the doctor, one of the two district nurses and two of the missionaries (assistant ministers) are all located in Gravir.

Gravir and Glengravir thus have fifty-eight legal crofts and fifty-six operative units. Less than half of the crofts with grazing rights are fully stocked and one quarter have under fifty per cent of the soum, including five without any stock. The common pasture of 2,652 acres is in general of poor grazing quality, dominated by the less nutritive species of grass and poorly drained. In 1957, a ten acre plot was fenced and re-seeded: only twelve of the operative units participated in this reclamation work, and the ages of the participants ranged between 27 and 58 years; this is significant as aged tenants are unable to carry out such work. This scheme could be extended annually; if potential improvements to the crofts are limited, pasture amelioration is virtually without limits. Re-seeding on a large scale would enable better stock to be kept rather than greater numbers; at present the sheep stock is over two hundred per cent of the sheep soum, and a ewe and lamb sell for as little as £2 10s to £3 10s, an indication of the consequences of over-stocking. The cattle stock is below the souming and this paucity of cattle is one of the notable changes in the agriculture since the 1930's for at that time as many as six cattle were kept on the larger crofts. The total stock kept in Gravir and Glengravir exceeds the souming by thirty-five per cent.

The great majority of the crofts can certainly not be considered economic units. Judging from the souming of one cow and follower and eight sheep per pound sterling of rent in a township where only seven crofts pay more than £2 rent, they were never intended to be self-supporting agricultural units. The produce of two cows and sixteen sheep, with potatoes, and in former days, bere or oats, locally milled by the three Gravir water mills, could scarcely ever have maintained a family. Fishing was the complementary economic activity, and in 1901 no fewer than nineteen boats and eighty-nine fishermen were registered at Gravir. Today, only one boat fishes commercially for lobsters.

If agriculture is singularly unrewarding, weaving occupies six of the males of insurable age and service occupations a further ten males and five females, but neither weaving nor service occupation are sufficiently available or attractive to keep the insurable population in the district. Twelve of the males between fifteen and sixty-four years take seasonal employment and forty-six are in permanent employment furth of Lewis, in all sixty per cent of the potential male resident population.

The economic problem of Gravir, in common with the other 'fishing' townships, became acute after the fishing industry collapsed after 1914, in the hay-day of the fishing most of the men fished all the year round, locally and on the west and east coast of Scotland. Earnings fluctuated but a man might make as much as £90 in a good year or as little as £5 in a poor year. Apart from the sale of young cattle, and wool surplus to home spinning requirements, the fishing earnings constituted the bulk of the croft income. Today, on the basis of the souming, the income of the largest croft including subsidies could only be approximately £150 excluding the amount to be set aside for home consumption of potatoes and milk.

LEMREWAY

Distribution of work through the year

1. Cutting. 2. Carting. 3. Planting. 4. 'Earlies' and mid-season potatoes. 5. Main harvest. 6. Planting. 7. Harvest. 8. Lambing. 9. Shearing. 10. Lambs weaned. 11. Dipping. 12. Tupping.

FIG. 9

[Lemreway]

vulgaris is dominant. Ling, which can tolerate considerable soil water, often occurs with Nardus, Molinia, Scirpus cespitosus and Eriophorium. A few rowans, usually near the shore, and a few willows, usually within stone enclosures, are the only trees to be seen.

Of the thirty-three legal crofts in Lemreway, nine comprise less than five acres, while seventeen are between five and ten acres. Of the remainder, only two exceed fifteen acres and one of these is 40 acres. Six unoccupied crofts are worked by persons other than their tenants, so actually the 290 acres of croft land are shared by twenty-seven holdings. The seventeen-acre 'outend' was originally divided between fifteen tenants but confused sub-letting has resulted in four separate holdings directly occupying nine acres, and working another four acres. Thus the outend today must be regarded as the monopoly of four 'unofficial' holders.

Little more than a quarter of the croft land is cultivable and even less is actually cultivated today: Figure 9 illustrates the crofting year. The broken terrain and the stony nature of the soil has permitted the cultivation of tiny 'lazybeds' and the total cultivated area is now about 46 acres. Only the strips of land on the gentler slopes, where the soils are deeper, are now cultivated, but every croft shows signs of former, more extensive, lazybed cultivation, often covering at least two acres. For example, on the east side, natural hay is cut on the well-marked lazybeds at about 225 feet.

Oats and potatoes, 29.5 and 16 acres respectively, occupy almost all of the cultivated ground. Most crofts grow about half an acre of potatoes and one acre of oats; both acreages have declined, the former with a declining population and the latter with a reduction in the numbers of cattle; hay has increased in importance. No bere is now grown, though before 1900 it was preferred to oats. Ruins of the bere mill, which ceased to function at the beginning of the century, can still be seen. Fifty-nine acres of natural grass are cut for hay but only four crofters had sown grass for hay in 1958, about three acres in all. Few vegetables other than potatoes are grown though carrots are said to grow well, and formerly turnips and cabbages were grown. The soil needs careful preparation to be productive and almost every crofter used some seaweed and at least twenty drew subsidies for lime and artificial fertilisers in 1958.

Stock totals have declined recently but the township has 36 cows and 22 calves. Only one croft is without cattle and 22 of the 33 working units have a cow and a calf. The township has an Ayrshire bull on loan from the Department of Agriculture; one of the few remaining elements of the co-operative township system is that this animal is fed by the crofters, in rotation, during the winter.

All but two crofters keep sheep; stocks vary between ten and 120 per holding but the majority have about 23 ewes with ten lambs. Although numbers have declined recently, the 3,025 acres of very moderate common pasture support a flock of about 1,150 sheep, including about 650 breeding ewes and about 300 lambs.

The souming is not enforced in Lemreway and it is remarkable that the total stock tallies almost exactly to the souming. An examination of the sheep soum reveals that the stock of 917 (excluding lambs) considerably exceeds the sheep soum of 626. It is interesting that it is nearly always the working units of over 10 acres that are overstocked; of twelve such units, eight keep more sheep than they are entitled to. Most of these crofts are grouped on the eastern side of the township where the crofts have a larger outrun.

Thus, while overgrazing is not so severe as in many townships, it represents a potential threat, particularly if the common pasture is not improved. However, in 1958 ten acres of the common pasture have been enclosed and re-seeded. Six acres were sown with ordinary mixed grass seed, two acres with pelleted seed and two acres with pelleted and inoculated seed. The eleven crofters taking part in the scheme put on 100 tons of sand to help drain and aerate the peaty soil, 2½ tons of ground mineral phosphate and 2 tons of concentrated compound fertiliser, grades 1 and 2 - all of it by hand. The area was sown in May 1958; by the following August, there was a striking difference between it and the untreated pasture. Next Spring, eleven cows will be grazed on this area. With the success of this scheme, it is hoped that more of the crofters will co-operate in re-seeding further areas.

CONTINUED ON NEXT FICHE

[Habost] [Kershader]

Of the 53 residents, 19 are over 65 and only 5 under 15 years, leaving a working population of 29: seven are in permanent employment elsewhere. The population has been steadily declining since its peak of 121 in 1901.

Since 1946, the township has changed considerably. It has been completely fenced and the method of cultivation has changed from spade and horse-plough to tractor and cultivators. A further fence has been erected for a lamb park and much land has been re-seeded; an increasing area has been put down to hay. It would seem that fattening of stock for market is intended, and better attention is being paid to stock. Yet the population is ageing and there are few young men to take the place of the older crofters; when working units become larger and stock decreases to a figure nearer the real carrying capacity of the grazing, the croft could become a profitable concern; at the moment, the croft is only maintained through grants and ancillary earnings. Should that happen, however, there must be more re-seeding and an increase of cultivation to provide winter fodder.

KERSHADER

Philip W. Wheeler, M.A.

Kershader is a township of forty-three permanent residents on thirteen crofts, which stretch for a mile along the southern shore of Loch Erisort. The crofts extend up to one-third of a mile from the coast with a two-and-a-half mile deep hinterland of common grazing. The extreme elevation is 270 feet and the average from 125 feet to 175 feet, but the crofts, mostly arranged in rectangular strips at right angles to the coast, are lower (maximum 125 feet) and include three main zones (Fig. 8):

(a) From the low cliffs of the shore to the road, approximately, a zone mainly below 50 feet, dissected by four rejuvenated valleys. The soils of the greater part of this zone have a distinctive profile and tend to be moderately heavy, wet, and unsuited to fertilization by seaware. The smaller hillocks in this zone have thinner soils of the same sort, but the main hill (crofts 10/11) is an extension of zone (c).

(b) A zone between 50 feet and 75 feet with hills rising to over 100 feet. The lower areas have varied soils, easily fertilised, and intermediate in type between those of (a) and (b), with peaty-loam characteristics, overlying aquiferous gravels. The higher areas have thinner soils of the same kind with poor grassy pasture; in places there are signs of former skinning.

(c) A zone of hollows with deep moss soils requiring intensive drainage and reacting well to heavy fertilization with seaware and intervening heights covered with blanket bog, partly skinned, heather and grass. This zone passes into the common grazing.

Crofts 10, 11 and 12, irregular in disposition, have a steep coast line with gentler slopes over 50 feet; crofts 2 to 8, steep slopes in parts of zone (b), and crofts 1 and 9, again of irregular shape, are intermediate (Fig. 5).

In Kershader, there are thirteen legal crofts and twelve operative units. The crofts vary between 4.4 and 18 acres, with a maximum of 3 acres reputed arable. In all, there are 23.45 acres reputed arable and 110.35 acres outrun. 24.5 acres are in fact under crop (oats 18.5, potatoes 6.0), and 9.5 acres under sown grass; and of the remaining 99.8 acres, mainly natural grass

[Kershader]

with heather and peat on the higher areas, hay is taken off 19.25 acres. Four acres, mainly for potatoes, are worked by spade but most of the cultivation is by tractor hired from Balallan or, in 1958, from Habost. Lazybeds are common and in some cases are carefully renewed, but the present tendency, reaching its extreme in a field of about two acres on one croft, is towards the formation of larger, ploughable fields for ease of tractor operation. Most cultivation is in zones (a) and (b), with little development of (c) at present. The only crops are oats and potatoes, with some garden plots of cabbages, turnips and carrots. The potato main crop is generally Kerr's Pink (Golden Wonder on one croft), with a couple of rows of Skerry Blue or Edzell Blue for earlies. There is no memory of Black Oats (Avena strigosa), and bere (Hordeum vulgare) has certainly not been grown since 1930, and probably not since 1909. The oats are grown exclusively for winter feed and are hand-threshed with stock and comb as the need arises; the last water mill in the locality went out of use after 1914, the last handmill in 1916; no grain has been sent to Stornoway since about 1930. Rotations are extremely irregular: some lazybeds are still cultivated with alternate crops of oats and potatoes and have heavy seaware and manure fertilization, but most other arable areas have some sort of oats, potatoes, oats, sown grass sequence. Fertilisers used are seaware and manure (ten crofts), manure (eleven crofts), sand (one croft), lime (ten crofts) and artificials - 'Potato manure' and sulphate of ammonia - on eight crofts. Artificial fertilisers and much of the seed are obtained through the Crofters' Agency.

The only two horses ever owned by this township were kept on croft 11 from 1936 to 1953. The plough was first introduced in 1936. When a tractor from Balallan became available for hiring in 1953, the horses were disposed of. The present soums are by cow, young beast and sheep per croft in proportion to rents and range from 3 cows, 3 young beasts, 69 sheep down to 1 cow, 1 young beast and 23 sheep. Eight crofts exceed their entitlement but no croft hasless than half the souming and the deficiency is mainly in cattle, especially young beasts. On the other hand, no operative unit is entirely without cattle as manure is extremely important. Cattle are kept for domestic milk supply, and calves, having qualified for subsidy, are normally sold at 6 to 8 months. 10 acres of the common grazing were re-seeded in 1957 and the following rhythm for milk cows is developing:-

(a) As soon as the weather allows in May, the cows are put out in the park for about three weeks.

(b) Next, about 6 weeks are spent on the common grazing between the ring fence and the new outer fence erected in 1957.

(c) Back to the re-seeded park for about five weeks.

(d) Return to the crofts for the winter, being let out either to the park or to the common grazings whenever the weather is suitable.

The young beasts spend much of their time on the outer common grazings. As most of the crofts, beginning with one in 1938 and ending in sequence with 10, 11 and 12 probably in 1959, are fenced, the old arrangements for township commoning from 15th October to 10th May are now obsolescent. Another park was also fenced for general purposes and for weaning in 1957. Prices for calves and cattle are very low and this discourages cattle breeding; on the other hand, lack of winter keep enforces an occasional sale.

The rhythm of sheep husbandry is largely independent of that of cattle:-

(a) By 20th November all sheep, except possibly the lambs, are cleared from the crofts for the tupping of breeding ewes thereon till 31st December. Every crofter now keeps his own ram, exchanging it or buying another at least once in five years.

[Kershader]

233 (b) From New Year to mid-April most sheep are kept on the common grazing. Practices,
311 however, are irregular; some flocks are usually hand fed, others only rarely. In the former
221 case they heft near the upper limit of their home croft and remain fairly close at hand.
231 Most crofters hand-feed their lambs, probably housing them at night, allowing them hay in the morning and turning them on to the common grazing in the evening. All this naturally depends on weather conditions.

(c) From mid-April to May, lambing takes place on home parks.

Most crofters let their ewes-with-lamb out at one date.

(d) At the end of June, gimmers and wedders are clipped.

(e) In mid-July the ewes are clipped.

(f) The lambs are weaned in the first and second weeks of August.

(g) The dipping takes place in October and the rams are brought on the crofts.

[432] There is no general sale time, sheep being sold or slaughtered at all seasons. There is no club stock, but all but one of the Kershader crofters, along with crofters from neighbouring townships, take full advantage of the arrangement, first established in 1941, to graze sheep at 2/- per sheep and 1/- per lamb in Park Deer Forest. Hence irregularities of rhythm are introduced or exaggerated.

231 Sheep are not particularly profitable: in general, wedder fleeces give 3½ to 4 lb, ewe fleeces
[236] about 3 lb, and the wool is sold to the Stornoway mills and to the Wool Marketing Board. Average
[435] sheep carcase weight is reckoned to be 41 lb. and the price rarely rises above £3 and almost never above £4. Braxy and fluke are kept under by medicaments but remain potential dangers; 'Black leg' is still a serious problem. Many sheep are drowned in the bogs in Spring and late snows (1955, 1958) are disastrous for lambing.

241 Under-employment is a serious problem in Kershader. There are nine males classified as
161 full-time crofters, but probably only four of these (two on one croft) are in fact in this category,
162 and of the total of thirty males with their homes in Kershader, only fifteen of the insurable
167 population are permanently resident. There are twenty-eight females with their homes in this
166 township, but on only six crofts do any of twenty permanently resident females help with croft work. Local ancillary employment consists of weaving, fishing (for domestic consumption
464 only) and work on the roads. Boats, one with outboard motor, are owned by three crofts. The
[463] only resident professional worker is a nurse. Ancillary employment must be, and is, sought
[501] away from the township. As a result, of the 73 persons recorded as having migrated since 1939 or as being resident, periodically away and permanently away in 1958, 19 have left the area for good, 4 are permanently away, 8 periodically away, and only 43 are resident. Only one person has entered the township since 1939. The age structure of the population, too, is far from the
[125] optimum. The school in Kershader, which had 20 pupils in 1873, reached a peak of 110 in 1907
[193] and declined to 28 pupils in 1953, now has but 17, although it serves Caversta, Garyvard,
[371] Kershader and Habost. Maximum population was attained in 1881, but the total remained fairly constant till 1911, after which decline was marked. Since 1950 this decline has markedly increased.

182 It will thus be seen that the most serious problem facing Kershader is that of stabilizing the
241 population and giving it a stronger economic basis. Apart from the potential development of tourism, fishing, weaving and other home industries, the only possible occupation is in
[313] agriculture with perhaps a little forestry. Forestry, though important as shelter provision, cannot be a practical proposition in large blocks or on a large scale, as it would dislocate the

[Kershader] [Garyvard]

182 common grazings - at present approximately correctly stocked - and cannot therefore provide
241 much employment. Hence it is the standard of agriculture that must be improved. Since the
[313] land does not permit striking extension or improvement of the cultivated area, development must be directed towards improving pasture, with more re-seeding and controlled grazing
400 similar to that already described. All this, however, is of little avail if prices for cattle, sheep and wool remain low, or at least lower than prices prevailing on the mainland. The first priority, therefore, in the establishment of a prosperous agriculture is a guaranteed market-price. Given this, it might become worthwhile to take steps to increase the carrying capacity of the crofts. It may be assumed that this would involve an all-round improvement which could give a firm basis to the economic existence of the community; until this is achieved, stability and continuity are out of the question.

GARYVARD

Gwenyth R. Page, B.A.

131 The landscape of the south-east coast of Loch Erisort is a sombre and rugged one. The
133 Quaternary ice sheets left in their wake troughs now filled by the sea loch, innumerable lochs covered in water lilies, a massive area of indeterminate drainage and expanses of bare gneiss.

Garyvard is set on the fringe of this landscape on a 20 to 25° slope with the crofts aligned
[551] from the moor to the sea, on a mantle of drift. Here is the home of the MacLeods, the Mackinnons
221 and the Montgomerys. Life beats out its regular pattern of existence during the winter months on the croft, followed by an increasing tempo and variety of work during the rest of the year. In
231 January and February the animals must be fed on hay or lose the battle to survive. In February
241 there are preparations for the year's tasks, making repairs and improvements to the croft. Next month will find the crofter on the land, making or clearing drains and putting fences and dykes in order. The tempo of life quickens with the year; April sees the first sheep dipping, the land turned over, potatoes and oats sown. From mid-May, the sheep leave the crofts to fend
[344] for themselves on the common grazing. The following three or four months are times of tremendous activity on the moors when the peats are cut, to be stacked later, first in fours, then in eights, so that the wind may dry them, till eventually bee-hive-shaped stacks - some four feet high - can be seen near the peat banks in August. Then begins the wearisome task of carrying the peats home, all too frequently in creels carried on the back, since the peat workings of Garyvard are on the moors up to half a mile from road. Altogether some two miles of roads are needed to prevent the villagers patronising the coal merchants of Stornoway. Two crofters, however, cut peat on their crofts, whilst others have permission to cut from Cromore or Caversta common grazings close to the road. All the while croft work continues, varying from hoeing, weeding and cutting hay to the gathering of sheep for shearing. As there are no fences between the various commons, crofters must travel from one township fank to another, seeking their own. In August the lambs are weaned. Hay making generally ends in August and is immediately followed by the oat harvest in September. By the time both oats and hay have been gathered in, the potatoes are lifted and the sheep are brought in from the common grazing about October 12th. The last sheep dipping takes place in November and is followed by tupping.

241 There are eleven crofts altogether, though one is divided, each portion having a legal tenant
423 who has a half share in the common grazing. Two crofts are 12 acres in extent, the half crofts 2.75 acres only, though the acre cultivated on the common grazing by one of the latter crofters since 1923, has recently been officially recognized. Most crofts are in strips running from the sea-shore up the slope some 500 yards to the township dyke, and are clearly demarcated by fences erected just after the last war. Three crofts have additional strips whilst one croft was an extra strip belonging to another croft. The additional strips date back about 100 years to a
[125] time when the township grew rapidly as a result of evictions in southern Park. One croft is divided and worked in three separate parts so in effect there are fourteen operative units in Garyvard.

Cattle are kept on 162 of the 219 units, in all there are 180 cows of three years and over, 47 ng cattle, and 110 calves. The usual practice is to suckle the calves, and sell them as soon they qualify for the calf subsidy; lack of winter-keep is one of the reasons for this practice. breeds of cattle are mainly Shorthorn and Aberdeen Angus with a few Highland cattle. The er function of the cow is to provide milk for the household; households without a cow rely inly on tinned milk. Cattle are sold at the twice-yearly market held at Garyvard, but prices tuate greatly. The townships of Park certainly do not carry a full souming of cattle.

Sheep are more important than cattle in the crofting economy in Park. The breed is the is Blackface, a small, lighter type of the Scottish Blackface breed. The sheep are pastured he common grazings in summer, and are grazed on the croft land in winter. The standard of p husbandry is also low as few crofters dispose of cast ewes or have a defined breeding cy as all stocks mingle freely on the commons. The lambing percentage for 1958 was about er cent and the number surviving in August compared to the total ewe stock was 52 per cent, it was generally agreed that 1958 was a poor year. A further indication of the quality of sheep is that in the fishing townships, a ewe fetches from 35 to 50 shillings, and a lamb t 20 shillings locally. The low lambing percentage and poor prices can be partly ascribed e lack of good grazing and to overgrazing, but disease and losses in a treacherous common ure raise the mortality rate. In general the sheep are left to fend for themselves with a mum of shepherding although the more progressive crofters hand-feed the ewes and hoggs in weather.

The majority of the crofters in Habost and Kershader, and a minority in Garyvard, rent addi- l grazing in Park Deer Forest, paying a fixed sum for each sheep. Sheep from these townships better prices; in the other townships a few wedders and fewer cast ewes are sold to the oway butchers. In many flocks, wool provides the only income from sheep.

is evident from Table II that the sheep souming is greatly exceeded. In the calculations, ewes ken as one unit, and 'other sheep', wedders and gimmers, have been calculated at half rate. is basis, the overall sheep souming is exceeded by 70 per cent and in only one township is ock comparable to the souming. Overstocking has been encouraged in crofting districts by e subsidy which was in operation till 1956 and it is notable that the rise in numbers of sheep ded in the Outer Isles coincided with the introduction of the Hill Sheep subsidy in 1938.[1] tocking is without doubt the chief reason for the high mortality rate in sheep. Calculation of erall relation of the actual cattle and sheep stock to the soum shows that the common grazings k are overstocked by 14 per cent. It is, however, impossible to calculate an exact figure, as mber of sheep grazed in Park Deer Forest was not enumerated. It is also evident from the ual croft surveys that the cottars, squatters and feuars, who have no rights of grazing, have equivalent to 157 cow units or 12 per cent of the total stocking. Thus the crofts of Park are ining an average stock fairly close to the souming, but the cattle-sheep ratio of 1:28 is too r proper management of the pastures.

general, a low standard of husbandry obtains in Park but it is clear that the agricultural ips are much more efficiently operated than the fishing townships. Overstocking occurs in of the twelve townships and sheep stocks are, with one exception, higher than the sheep souming

Scotland as a whole, the number of sheep recorded declined from 8,007,134 in 1938 to 336,000 in 1955.

231 Table III reveals that there are 177 agricultural units with a souming; ten units are crofts in Glengravir without a souming and the remainder of the 219 units have no grazing rights. From this Table, it is clear that full stocking and overstocking increase with the size of the croft: the units of ten acres and over, on the basis of stock carry, would appear to be the most intensively worked. In all, just over half of the units take up their full souming. Table IV gives an [463] analysis of employment ancillary to croft work for 141 of the 219 units and it would appear that [561] neither ancillary employment nor age is significantly related to the intensity of croft working. [887] Table V points to the fact that more full-time crofters are to be found on the larger units but that less than one in four of the younger and more active men are full-time crofters. Tables [311] III, IV and V underline the fact that the larger units are also the more successful and it is significant that the larger units are almost all on the better land in the agricultural townships. The average size of holding in the agricultural townships is nine acres, compared with less than eight acres in the fishing townships, where the land is much poorer and the cultivable area much more restricted.

175 The trends in agriculture are illustrated by Tables VI and VII. The Crofters' Commission made 178 a survey of the crofts through the medium of Estate Factors in 1883; from Table VI it is evident 241 that the number of cattle was much higher at that time and that the cattle-sheep ratio in the 231 selected townships was 1:3 as compared with 1:25 in 1958. Table VII gives agricultural statistics for the parish of Lochs as a whole; separate figures for Park are not available. Since 1913, radical changes in the crop and stock patterns have taken place; bere (Hordeum vulgare) has disappeared as a crop, and sown grass and permanent grass for hay have since 1947 become the leading crops. Horses have all but disappeared, and the cattle-sheep ratio has risen from less than 1:4 to 1:39 for the whole parish. Since 1938, cultivation in Lochs Parish has declined by 36 [511] per cent. Large areas of lazy-beds, no longer cultivated, are visible landscape signs of these [824] changes; seaweed, the sine quae non for lazybed cultivation, is no longer carried to the upper parts of the crofts. In fact, many of the crofts no longer use seaweed as a fertiliser.

233 From the foregoing account, it is clear that there are two major agricultural problems in Park, 241 the lack of sufficiently large crofts with good arable land and an insufficiency of common grazing; these deficiences bring in their train the problem of overstocking, and the existence of uneconomic holdings.

241 The more progressive crofters, significantly resident on the better crofts of the agricultural 242 townships, have shown how croft land can be improved by re-seeding and sowing down to grass, 176 practices which could be fruitfully extended throughout Park. In addition, several townships by co-operative effort, have reseeded small areas of the commons grazings with splendid results.

241 However it is clear that it is not possible for 219 viable agricultural units to be maintained on the present crofting area. The optimum size of croft which could maintain a family is a moot point, for the location and situation of a croft and the quality of the land and common pasture would all have to be taken into account in making an assessment.

231 This problem was referred to a practical agriculturalist who was asked to state what size of 241 croft and number of stock would be required to provide an annual income of £300, excluding croft 242 benefit (milk, eggs and potatoes consumed on the croft) and any costing for labour. To fulfil these conditions, one of the fishing townships was carefully analysed, and the expert came to the following approximations, assuming that the rules of good husbandry were in force after the croft had been brought up to a good standard of cultivation and re-seeding had been carried out where possible on the outrun and Common Pasture, and provided there was no overstocking, and that present favourable subsidies and prices continue:-

231 Size of croft: 6 acre
241 rights in Common Gr
242

6 cows, 2 young

231 Income
241
242 Sale of 1 cow, 5 calves, 10 ca
634 3 wedders, and 28 lambs say
Sale of wool
Subsidies on cows, calves and

Total income

In order to work such a croft ef and would require the assistance of particular township studied, the nu present total. Considering Park as half of their present number but thi general evidence. It is clear, howe the present crofting area of Park.

000 From a detailed study of the agr situation is far from being an optim crofting economic, and such reorga crofting sector of the community de ancillary industry are discussed on continued depopulation. [Seaforthhead]

161 Table XVII reinforces the idea that there is a striking dichotomy between the agricultural
162 and fishing townships. The former are characterised by a more stable population trend,
166 significantly fewer of the population in permanent employment furth of Park, and a smaller loss by
167 migration. In the fishing townships, where growth and decline have been equally meteoric,
241 there is a larger proportion of persons in permanent employment furth of Park, and migration
228 losses have been greater. It is also significant that there is a smaller natural increase of
632 0.5 per cent in the agricultural townships. The only township which shows a natural decrease over this period is Calbost, one of the fishing townships.

SEAFORTHHEAD AND SHIELDERNISH

Rachel A. Hirst

131 Seaforthhead and Shieldernish are separated by 4,485 acres of rough grazing, the former lying on the northern shore of Loch Seaforth and the latter on the southern shore of Loch Erisort.

SEAFORTHHEAD

133 Seaforthhead, the most isolated of all the Park townships, consists of three crofts and a
361 gamekeeper's holding. The township boundary is situated between the 50 and 75 foot contours which at their furthest extent are only 150 yards from the shore. Immediately behind the road the land rises very steeply in rough uncultivable moorland covered with many boulders but generally below the road the land slopes gently at about 5-10 degrees, in places being
[241] completely flat. Here, however, the lazy-beds are very boggy and rushes have appeared in the ten years since cultivation ceased.

134 The soils are deep near the shore due to soil creep; higher up they are very thin and peat
137 accumulates to at least 3 feet both below and above the road. There is little cover; bracken is rare, but silverweed and heather, moorland sedges and grasses soon colonise disused lazy-beds.

241 Legally there are three crofts but only one is still cropped, the other two being used solely
[233] for grazing. There is, however, a gamekeeper's holding within the township boundary worked as a croft. The other two crofts are used as ancillary grazings to holdings in Airidhvruach and Balallan and have not been lived on for forty years and ten years respectively.

[244] The chief crops are oats and potatoes, though the gamekeeper had a patch of turnips and the other croft had grown them during the last few years until 'finger and toe' developed.
[407] Patches, about half an acre in extent, are drained with stone drains and ploughed by tractor, after which potatoes are grown to clean the soil, followed by oats for one year and then sown hay for three to four years. This is not strictly adhered to and several lazy-beds appeared to be
[314] in natural hay. There is no peat-cutting on the crofts as peat is secured just outside the township fence on the common pasture. Lambing has been poor for the past two years being
[231] only 50 per cent in 1958; the stock carried is twice the sheep soum. The cattle, Highland and Ayrshire or Shorthorn crosses, are below the soum, but previously nine cows and followers have been kept.

161 There has been a great decrease in population and cultivation since the resettlement in
162 1886. In Seaforthhead and Shieldernish as a whole, there were twelve crofters before the
241
178

[Seaforthhead] [Shieldernish] [Habost]

161 suppression of the original townships opposed to six today. As a result, many lazy-beds, now
162 given over to natural grass, are being gradually encroached on by heather and juncus. Out
241 of the present population of twenty-three, one is permanently away and two have migrated
178 since 1939. There is a more healthy population structure, with a large number of males between 15 and 44, due to a large family having returned home and six children, five of school age.

361 In Seaforthhead and Shieldernish all settlement is below the road and house-sites are on
[349] slight elevations. At Seaforthhead is the reputed hunting lodge of the Seaforth's, 'Seaforth Castle',
[505] now ruined, but still showing signs of abnormal size and arrangement. When first settled,
[491] communication was by ferry (1820). Now a cart-track, deeply rutted, to Eisken Lodge gives
[178] access to the Tarbert-Stornoway road two-and-a-half miles away.

SHIELDERNISH

131 Shieldernish, also consisting of three crofts, is better situated on the Park and South Lochs
361 road. The three houses are situated on a well-drained northerly slope, half-way between the
342 road and the shore, but the three crofts are on better land and greater accessibility has led to better management and new ideas.

241 Cultivation in isolated patches reaches up to nearly 100 feet and the lazy-beds have been put
311 together to permit ploughing by horse or tractor. One croft grows neither oats nor potatoes,
[246] preferring to enclose two one-acre parks, re-seed them, cut the hay in June, and wean the
[231] lambs on the aftermath. By next year, this crofter hopes to have enclosed and re-seeded a
[244] further acre and will then use the three in rotation. The other two crofts grow both oats and potatoes and one is also sowing down. The crofts average fourteen acres in size but although gentle slopes are extensive, the major part of the crofts is in permanent pasture. The total
[226] stocking on the Shieldernish crofts is below the souming. Fishing is now only for domestic use
[8 8] though there is a small jetty on No. 1. Part-time weaving is performed on two of the six crofts.

The future pattern would appear to progress to more grazing and less cultivation. Two out of the six crofts - both at Seaforthhead - are worked from outside the township and this isolated township, being difficult of access and having little cultivable land, is better suited to grazing. Shieldernish appears more suitable for enclosing parks for fattening lambs, as soils are deeper and slopes gentler, making the use of a tractor feasible. More could be got out of the crofts especially with fertilising and re-seeding for hay and pasture and growing
[185] fodder crops for wintering. It is hoped to fence the common securely, and then stock will be renewed - a great necessity. Daily communication with Stornoway also means that Shieldernish is better placed than Seaforthhead for a flourishing settlement. The crofts are certainly of a workable size - provided part-time work, such as weaving, is maintained, along with the grants from the Crofter's Commission.

HABOST

Rachel A Hirst

131 Habost is scattered around a small bay on the south shore of Loch Erisort. Settlement
133 stretches for over a mile encroaching on three small hills separated by wide, well-drained
241 valleys which soon rise to the dominating Craigeal (225 feet). Slopes are varied but tend to
361 flatten out at about 100 feet near the road and on this flat, most of the cultivation takes place.
[134] Nearer the shore, slopes are much steeper and on the hills there are bare rock faces and thin soils.

134 Drift is found near the shore and laps round the three hills nearly up to the road, predominantly heavy clay with small boulders; this is replaced above the road by peaty loam on rock. At one time, here was grown on the heavy drift. There is peat accumulation on the flat land near the road to a depth of about six feet and there are one or two peat banks.
137 Vegetation is poor; there is no bracken or cover and within the crofts, moorland grasses and sedges predominate on rough land, though there are many lazy-beds sown down to clover and cocks foot. On the hills heather predominates.

175 Habost is the oldest township in Park. In 1843 Maclennan came from Shieldernish and
692 took what are now Nos. 9, 10, 11, 12 and 13 and Allean Tailear came from Taransay, Harris,
621 to No. 7. By 1886 there were thirteen crofts; in 1907 four cottars were recorded, three being there before 1886; in 1957, No. 11 which had been shared between two brothers since 1906, became legally 11A and 11B making fourteen crofts. There are also fourteen operative units although two are worked from Kershader, both as 'hay and grazing' units, and two are worked as one unit within the township, for there are three non-crofting units.

241 Only sixteen lazy-beds are dug by spade, the rest have been drained with stone drains and
409 ploughed by tractor owned by one crofter who loans it out to Habost and Kershader. There are three 'Croftmasters' (hand-tractors) in the township but these are only heavy enough for bringing in peats, hay and similar light work. The progressive Habost community has fenced
233 off part of the common grazing, to keep the weaned lambs off the croft from August till November and so save fodder for winter when the croft land is open to grazing.

[244] Oats and potatoes alternate in the rotation, with a little sown grass for hay, sown in enclosed
[246] parks of about one acre. The tendency now is to increase the number of parks, cut the hay in
231 June and build up the lambs on the new grass. Shell-sand is used to fertilise the parks but
[324] elsewhere artificials, such as superphosphates, 'potato manure', potash, nitro-chalk and lime are used in addition to dung and, near the shore, seaweed. Most of the hay is taken from old lazy-beds.

231 The land is heavily overstocked: the soum is equivalent to 79 cow units, and actual stock is
233 144, whilst the figures for sheep are 191 and 618 respectively, including the sheep stocked in
[432] Park Deer Forest by seven of the Habost tenants. Sales of cattle are held at Garyvard in November
[221] and May and sheep and lambs are sold in Stornoway. Lambing was poor in 1958, 50-75 per cent being general, but many breeding ewes and other sheep have died.

241 The only cultivation on the common land belongs to the unofficial holdings. Behind Craigeal, however, there are some old lazy-beds, a well and ruins of a hut, which has not been used since
[311] before 1852. There used to be shielings on the far side of the common on Beinn Bhuidhe and
[226] below Loch na Ciste but these have not been used since 1888. Habost is one of the agricultural
[288] townships and fishing is only for domestic use; looms are to be found on only four crofts and
[493] trade is slack. One crofter has a lorry for contracting, carrying peats, fertilisers and stock to market and two have butcher's rounds in Lochs. There are two small stores.

361 Settlement is scattered, always on elevated ground, and in many cases the new house has
[312] been built in close proximity to the old house site. All have piped water either from the well or
[354] from a rain tank, drinking water being carried in the latter case. Grants from the Crofting Commission are enabling new building and improvements to be carried out.

ONTINUED
FROM
PRECEDING
FICHE

[Orinsay]

361 which rises steeply, exceeding 375 feet in the west and 150 feet to the north and east. From
24 the north-west and north-east two glacially deepened valleys drain southwards, their lower ends
[188] being "drowned" by northward extensions of the loch.

134 Although peat covers most of the surface it is only in the hollows that it is significantly deep, for even on the gentler slopes the peat cover is frequently so thin as to expose a layer of morainic sub-soil containing many stones and boulders.

137 Two rowans and a dozen willows represent the only tree growth, but tree stumps frequently exposed in peat-cuttings suggest that woodland was formerly more evident. Whether this former woodland disappeared as a result of human action or of climatic change it is not possible to say, but it is certain that a century of overgrazing has not favoured natural regeneration. Moorland grasses, sedges and a little poor heather characterise much of the area, and reflect the poor grazing capacity of much of the moorland. Bracken has established itself in one limited area on a patch of neglected croft land.

195 Orinsay is unique in Park, for the present township is entirely a twentieth century development.
632 In the early 19th century there was a settlement at the head of the loch, but in 1843 the residents were removed and the area enclosed and added to Crobeg sheep farm. In 1916, there was a proposal to establish fourteen crofts, but the applicants were requested to wait until after the war. At the end of the war the return of many young men with a desire to settle down led to serious overcrowding in Lemreway. Several of them 'raided' the Orinsay area. At first living in huts, they built their own houses, and in 1922 the Department of Agriculture intervened, recognizing and fencing off fourteen legal crofts, and at the same time providing a good footpath. Seeing the success of their neighbours, four other Lemreway families, comprising 26 people, went to Stiemreway, about a mile to the west of Orinsay. Here, however, the Department of Agriculture did not intervene and with the community remaining isolated, most of the settlers returned to Lemreway within three years, although one family remained until 1939.

241 Six of the crofts have an area of less than ten acres, six have between ten and fifteen acres, while the remaining two occupy eighteen and twenty-five acres: the largest croft originally belonged to the shepherd on the sheep farm. Three of these crofts are not occupied, although worked by other crofters, with the result that eleven operative units share 161 acres.

241 Only a small part of the croft acreage is actually cultivable; even less is cultivated in practice.
311 The broken and rocky terrain combined with the peaty soil allows nothing but the cultivation by spade of tiny lazy-beds. The total area now cultivated does not exceed 25 acres, although in the past it may have been nearer 40 acres.

241 Oats and potatoes are the staple crops, occupying 9 and 6½ acres respectively in 1958. Individual
244 croft acreages of these crops vary in relation to the requirements for winter stock-feed, and in the
246 case of potatoes, to domestic consumption. Nevertheless to produce even these meagre returns the soil requires careful preparation. A plentiful supply of seaweed is obtained from the shore and is the most frequently used fertilizer, while a little sulphate of ammonia is applied. Only two crofters use lime.

[291] In the last two decades a marked reduction in the amount of oats grown has accompanied a decrease in the numbers of cattle and an increasing use of hay for fodder. Nevertheless only about 17½ acres of hay altogether are cut, and only five of the crofters sow any grass seed.

231 In August 1958, the township supported only 13 cows, 3 young beasts and 8 calves. Half of the crofters have a cow and a calf, but three have no cattle at all, and one even used condensed milk, a sad commentary on the state of crofting in Orinsay, but a phenomenon by no means uncommon in crofting areas.

231 Recent trends also point to a decline in the numbers of sheep, although more are kep
[288] fifteen years ago. From 1942-51 the numbers were more than doubled (263-565). A gre
this increase must have been a result of the ewe subsidy, but part at least may be conne
the war and post-war boom in Harris tweed. By 1955, when the subsidy was suspended,
had already begun to decline and have since fallen steadily. This year the township has
breeding ewes while the rearing of only 236 lambs would suggest a further decrease in th

221 All the crofters keep some sheep although individual stocks vary from 15 to 150. Fo
233 the year these sheep are grazed on the common pasture on the moor or on the eighteen a
in the bay. In August, however, the lambs are gathered in for weaning and dipping; in N
the gates are opened and all the sheep allowed to graze on the cleaner pasture within the
boundaries. If necessary they are given fodder, but from the beginning of January they
ged to return to the moor, although the gates are not 'officially' closed until May.

311 The total area of the common pasture exceeds 1500 acres, but most of this consists
233 waterlogged peat moorland supporting only poor quality coarse grasses and sedges. Ove
sheep now graze this area and the apparently large common pasture is in reality drastic
stocked, a process which must inevitably harm the animals as well as the land.

231 No pigs or horses are to be found in the township and each crofter keeps very few he
235 just sufficient to provide eggs for home consumption. Any surplus eggs which do remai
[435] to the Co-operative van, but prices are so low that the keeping of more than a dozen hens
from profitable.

434 It can be appreciated that crofts of this size and quality can neither provide the croft
464 family with sufficient income, nor fully occupy the available labour force. As a result,
228 in the past have turned to the sea. Indeed the West Highland Survey describes Orinsay
a fishing township". Today the herring fishing has disappeared entirely and only one cr
does a little lobster fishing, sending his catch direct to Billingsgate.

161 There are now 45 people resident in Orinsay but an examination of their ages reveal
162 than half of them are between 15 and 64 years. Indeed there are only six resident male
these ages, and three of these spend at least part of their time working away from the t
the Elishken estate.

366 As there is neither a school, post office, shop nor garage in Orinsay, there is no a
369 occupation in the 'service trades'. Therefore, over half of the males between the ages
166 are permanently away in the Merchant Navy, returning home only for holidays, while an
167 are seasonally away with the whalers. Similarly almost half of the females of similar
664 domestic service in Glasgow. It must be realised that most of these people working aw
505 their families at home, and that a large part of the croft incomes are made up of mone
228 together with pensions and other allowances. Emigration from Orinsay to other areas
462 steadily, twenty people leaving the township since the war.
352
454 On the whole, housing conditions are good, due to relatively recent construction. T

[208] telephone and a shop, but is served by travelling vans. A good road, constructed withi
366 decade, connects Orinsay with Gravir; entering the township via the valley to the north-
431 serves directly all but three of the crofts. A bus leaves daily for Stornoway, about thi
494 distant.

161 Like so many other crofting townships Orinsay, above all else, gives an impressio
162 gestion. The self-same hills that provide shelter also restrict cultivation. The crux o
situation is that land, extremely marginal in character, is being worked by too many te
holdings too small to be economic. With three residents to every two acres of cultivat
Orinsay must be seen as an 'overspill' - an unfortunate result of the cottar problem in

/p. 35/

The labor in this pastoral-agricultural economy is provided by the crofter's family, periodically aided by some or all of the families who share in the common grazing.[11] Under the direction of the father, the mother and children care for the crops and cattle. Heavy work, such as ploughing, reaping, and feeding the cattle in the winter, is left to the men. The women milk the cattle, help at the harvest by raking and stacking, and care for the garden. Although men never do any work in the house, in the absence of a son the wives and daughters are expected to fill in the gaps in man's work in addition to running the household. Inter-family cooperation centers on the handling of the sheep. Frequently, the families who share the common own the sheep collectively, as a "club stock," and share in the expenses and profits as well as the labor. The only basic pattern in the division of labor is that women never shear, and it is their responsibility to feed the group.

Formerly, the annual economic cycle was adjusted to the demands of crop cultivation and cattle breeding. Within the last hundred years, however, sheep have assumed commercial importance and now determine the seasonal tempo of labor. The old year ends and the new begins with the bringing in of the rams from the hill. In March the sheep are dipped and then the preparations are made for the lambing season, in April. From spring until autumn there is a rapid succession of duties: ploughing, planting, peat cutting, dipping and shearing the sheep, stock sales, harvesting, and similar tasks. After the

[11] Cf. Ibid., pp. 63-64, 70-74.

rams are put out in November, the pace becomes slower, the main job being the feeding of cattle.

The economy is neither a subsistence nor a self-sufficient economy for the majority. All but a few large crofters have to supplement their income from the croft with some form of outside employment or independent source of income, for example, contributions from a child or a pension. For many the croft is no more than a home. For an aged person, it provides a means of living cheaply. The rent, which is fixed by law, is only nominal, and the taxes are negligible. There is more to crofting than simple economic considerations. Indeed, if it were only a matter of economy, the system would have been abandoned long ago. It is a way of life in which the individual finds meaningful patterns of interaction and an ascribed status compatible with his aspirations. The land is more than a potential source of income. It is the ancestral home. The tie to the land is an expression of the sentimental bond of kinship.[12] Many, perhaps the majority, have spent a good part of their lives in other parts of the world working for a wage and looking forward to the day they might return to the Misty Isle. Although only the Glendale crofters are land owners, the law has given the tenants complete security of tenure and the right to bequeath the croft to a member of their family. Thus, they can return to their township and find solidarity.

[12] Cf. Ibid., pp. 64, 81.

rs. In the spring they were turned loose on the moors. For entification their owner either cut their ears or burned their ns with a hot iron.

As soon as possible after the spring sowing, the stock moved to the rough grazing lands. Although there is no dence to suggest that the sheiling (from the Norse skalinr) e formed a part of the annual routine, its later importance es it plausible. Rude huts of stone or timber were erected the higher mountain pastures to which the cattle were driven the people of each farm. In the sheilings the women cared the stock and spent their time making dairy produce. For young men and women it was a time for courting. The able ied men must have taken only a limited part in the sheiling e; they were kept occupied with other duties.

Droving Trade. The chief industry of the Skye was the le trade with mainland Scotland and, after the Union of , England. As early as 1502, "marts," surplus cattle sold in the autumn, were being exported from the barony of ternish.[66] By the middle of the century, the Highland trade grown to such proportions that the Privy Council was forced nact measures for the preservation of order at the markets. he close of the sixteenth century, a MacDonald chief had blished a regular trade in cattle and ponies between the r Isles, Skye, and the east coast of Scotland. By the of the Union, Skye had become the largest producer of

[66] For details on the droving trade, see A. R. B. Haldane, rove Roads of Scotland (Edinburgh: Thomas Nelson and Sons, , pp. 2-35, 60-63.

While the process of commercialization proceeded against the persistent efforts of the people to maintain their traditional way of life, events in Great Britain were beginning to have a pronounced adverse effect on the local economy. The end of the Napoleonic Wars brought the cattle boom to an end. Although the droving trade remained brisk, the value of the stock declined markedly.[37] An increase in the number of cattle on the grazings, as a means to maintain an economic equilibrium, was impossible. The island was already overstocked and had been devastated by this practice. At the same time, development of large scale commercial farming in the Lowlands had encroached on the right of way of the drovers, and the Skye cattle were suffering at the markets from competition with improved, better nourished breeds from the northeast and southwest. The end of the wars also witnessed a decline in the kelp market.[38] Parliament finally completely undermined kelping by recurrently reducing the tariffs on foreign substitutes.

The crofters, who had suffered rackrenting to get their small strips of arable, found themselves without the means to pay the rents which had been set at the peak of the cattle and kelp markets and without enough land to meet subsistence needs.[39] The striking thing is that in spite of increasing economic hardship, the population continued to grow. They became hostages

[37] Haldane, The Drove Roads of Scotland, pp. 205-221.

[38] Malcolm Gray, "The Kelp Industry in the Highlands and Islands," The Economic History Review, Vol. IV, No. 2 (1951), pp. 197-209.

[39] Canon MacLeod, The Book of Dunvegan, Vol. II, p. 115.

wealth, rose above the indigent crofters and cottars.

These changes had a pronounced effect on the culture and the population. Economic hardship and evictions prompted emigration, forced many men and women to seek seasonal work away from home, and led to a reduction in the marriage rate. Crofting which had already become part-time agriculture now was a spare-time pursuit. The Sgiathanach was dependent on money, on the wider economy, for the satisfaction of most of his needs. The croft was providing no more than a few potatoes for the table and some oats for the cattle, the crofter's only export. Still, no landless working force appeared. Portree had grown and there was a woolen mill, but there does not seem to have been any marked movement into the village by the crofters.

While much of what was meaningful to the people was being lost, the religious Revival continued. The conservatism of the "Men" became an official policy of a new church. The emotional approach of the ministers and the "Men," who were now elders in the church, and the emotionalism of the large outdoor meetings functioned to restore the social disequilibrium. Although the extended family, township, and nuclear family suffered from instability, the people found intelligible roles within the religious sphere of activity. Their religion was reinforcing their way of life. The abhorrence of much of the old culture was accompanied by a strengthening of many traits which reaffirmed the desirable status values. The culture found a new focus in congregational religion and was able to maintain a continuity while the content changed.

enlargements when the proprietor would not lease it on reasonable terms. Thus, the government began to protect the crofter from potential abuses and to restore the land to the descendants of the clanna, who had, to say the least, manifested a persistent disinclination to accept any other system of land use. A complete reformation, however, was not yet possible.

The crux of the problem of maintaining the crofting population was succinctly stated in 1851 by the chairman of the Highland Destitution Board. The people could not support themselves, at a subsistence level, unless each crofting family were given ten acres of arable land plus pasture. Not only was there not enough land, but without credit facilities, a man could not find local employment until the land began to produce, and, if he sought employment at a distance, he could not work his land to free himself from the necessity of working for a wage. In 1883 it was estimated that a 50 percent reduction in population would not leave enough land to give each family an adequate holding, ten acres of arable and 277 acres of grazing land.[81] How right they were. Today the population is less than half that of 1883, and still very few have what was considered an adequate holding a hundred years ago. Let us see what measures the government took in the attempt to solve this problem.

At first the land reorganization program was thwarted by a lack of available land and by the continued tendency of

[81] Napier Report, pp. 100-101.

the people to overstock. No land could be assigned as an enlargement if it would inpair the value of a sheep farm or deer forest. The remainder of the island was already possessed by crofters. Moreover, there was no one to regulate the use of the common grazings. As the Crofters Commission usurped the functions of the landlord, estate management became lax. The township constable had disappeared. The cottars, 36 percent of the population, had been omitted from the provisions of the Crofters Act. Later when the government provided for a grazing committee to draft voluntary regulations forsharing the common grazing and, finally, coerced the crofters to elect a grazing committee, the regulations could not be enforced, except by appealing to the sheriff.

At length another commission of inquiry visited the Highlands to decide how the resettlement program might be extended. Then, in 1897, the Congested Districts Board was created. The Board was given power to purchase land for enlargements and for creating new holdings, to resettle crofters and cottars from congested districts, to foster the development of stock breeding, agriculture, fishing, and home industries, and to improve communications. It was not intended that the government should become a landlord. The crofters, like the Irish small farmers, were supposed to have acquired a desire to own their own land. In 1904 the estates of Glendale, the present twelve townships, and Kilmuir, the whole parish and part of the parish of Snizort, were purchased. On the Kilmuir Estate there were 450 crofts in 35 townships and 10 large farms.

Heavy rackrenting in the past had led to dissatisfaction and arrears in rent, the crofters' weapon against the landlord. The rents were revised and most of the arrears were cancelled. All the farms but one were subdivided to form 79 new holdings in 7 reorganized townships and to make enlargements to the other townships. The Glendale estate received similar treatment, being made over into 147 crofts in 12 townships plus a jointly held club farm. Both estates were sold to the crofters on a fifty year annunity basis. Then came a rude awakening. Within ten years the crofters found ownership to be a dubious privilege, especially since it excluded them from the benefits of legislation favoring the small tenant. The Kilmuir crofters were released from the contract, but the government refused to accept the petition of the Glendale people, who still are not pleased with their rather unique position. Private ownership of the land might be said to be as alien to their heritage as village settlements.

Land settlement continued, with the introduction of certain refinements, the most important of which was the power to use compulsion to acquire land for crofting in the national interest. Today over half the Island is owned by the national government and administered by the Department of Agriculture. The tendency in recent years has been to create more adequate holdings. On the Kilmuir estate the number of crofts has been reduced from 530 to 442. The process of resettlement, or de-commercialization, has been carried further on Skye than in any other Highland area.[82] It has also included the only major

[82] Cf., e.g., Collier, op. cit., pp. 90-113; and Hance, op. cit., pp. 61-62, 64-68.

migration scheme to be attempted. In 1923 sixty-eight families from the Isle of Harris, in the Outer Hebrides, were brought over to Skye and settled in Bracadale. Probably, close to 300 new holdings and in the neighborhood of 200 enlargements have been made since 1897. This clearly reflects the limited space available for crofting at the end of the "Clearances."

In addition to land settlement, the government has continued to stimulate improvements in stock breeding techniques and to foster more efficient land utilization. Credit facilities, by grant and loan, were offered to enable the crofters to purchase stock, especially sheep, and to build new cottages. Grants and subsidies, in an ever increasing number, have been made available to promote a fuller use of the land. Initially, under the Congested Districts Board, these facilities were devised specifically for the Highlands. By the time the Congested Districts Board was abolished, the crofters had become officially integrated with the national agricultural scene so that specific subsidies, grants, and loans were replaced with an opportunity to apply for assistance within the national program of agricultural development. Instruction in scientific methods of agriculture has been another continuing function of the government through a series of advisory services and, more recently, by a program of demonstration crofts and farms. Access to markets has similarly been facilitated by improving communications by land and, to a lesser extent, by sea.

Security and protection for the crofters has been another unfailing interest of the government. Again, with official integration, the scope of legislation has been extended to

include all small tenants in Scotland. The landlords have lost their right to evict a crofter for breach of conditions. Since 1911 only the Land Court, which replaced the Crofters Commission, can remove a tenant who is guilty of bad husbandry. Moreover, such action can only be taken after the general circumstances of the crofter and his need of the croft for a home have been considered. To date, no Highland crofter has been removed. In fact, security of tenure has been carried to the extreme that the individual no longer has to reside in Scotland much less on his croft. Although this change is now regarded as inadvertent, the courts have ruled in favor of the small tenant. The only remaining functions of the landlord in estate management are to collect his rents and pay compensation should a tenant desire to leave. Both the rents and the compensation are determined by the Land Court.

Accompanying the integration of the Island with the national scene, politically and economically, were extensions of social services. Prior to 1872 education was the responsibi of the church, charitable agencies, and, especially in the Highlands, the local proprietors and their financially secure tenantry.[83] Although the parish school-system was national, the administration of each parochial school was local. The ideal of a school in each parish was neither adequate nor easily obtainable. The result was a few regularly taught schools.[84]

427 acre of turnips. All of the oats and a large share of the
241 potatoes and turnips are used to feed the cattle during the late
231 winter and early spring. Some crofters, by no means all, have a small kitchen garden for cabbage, onions, and other vegetables. Usually, at least half the croft is left under grass, part of
427 which is cut for hay. After all the people in the township
233 have finished their harvest, on a day set by the grazing committee, the individual holdings in all but thirty of the townships are opened to communal use as winter grazings.[4] It might be added that the sheep and cattle often find the village of Portree a very lucrative pasture. It is not only the grass which entices the cows. More than one villager has had a tug-of-war with a cow bent on devouring clothes off the line. Another favorite food for the cattle is coal. As one man in the Braes said: "We burn half the coal; the cows eat the rest."

The Value of the Croft

427 What does a croft mean to the Sgiathanach? In terms of
511 everyday economics, there can be no simple answer. For a few, probably no more than fifty families, the sale of cattle, sheep, and wool provides an ample income. The families are able to obtain the necessities of life and enjoy a comparatively high standard of living. The majority live on crofts which cannot begin to support a solitary individual. Expecting little more

427 241 231 434 The Income of a Small Croft. The small croft is regarded b
local agricultural experts as having a potential income of
£20 a year. In addition, it provides a home, potatoes, som
vegetables, milk, eggs, and the right to cut peat. Even if
not quite legal until June, 1954, it frequently supplies
mutton and, less often, beef for the family. The budget fo
this type of holding in my sample reveals that even when
fully stocked and the ground tilled, the income may be negl
gible. Let us look at the cash income and net profit for
1952 and 1953.

In 1952 the cash income for the croft was £8 13s. 11d
The net profit, which takes into account depreciation and
stock valuation after sales was £2 1s. 11d. In 1953 the
cash income was £12 8s. 9d., and the net profit was £5 8s-.
These figures include money from the sale of stock, govern-
ment subsidies and grants, and home grown produce eaten by
the family. Unfortunately, I do not know the number of hou
which were spent earning this meager return. The crofter's
wife said about 300 hours of her labor. To this we must ad
seasonal cooperative labor.

This particular croft is rented by a middle-aged marr
[463] couple and a spinster sister of the wife. The man works ful
[593] time as truck driver, leaving most of the work on the croft
to his wife. The stock is two cows and followers and sixte
to eighteen sheep. There are six acres of arable land, hal
of it under hay and grass. The remainder is planted in oat
potatoes, and turnips. The budget may not be typical. For

eighteen to twenty pennies equalling an ounce of silver, the land valuation on Skye was based on the number of cattle which a farm could support.[65] All other stock and the amount of cultivatable land was disregarded, being considered as necessary to the support of the tenants. Wealth was measured by the number of cattle an individual possessed; quality was a secondary consideration. The number placed on the land, therefore, was regulated by how many could be carried over the most favorable part of the year. As a natural consequence, a chief agricultural defect was overstocking.

The tacksmen left their cattle and horses on the hill the year round. No attempt was made to separate the beef and dairy cattle, and, except for milch cows, which were given some straw, boiled chaff, and, in late winter, a few sheaths of oats, the cattle were not fed. Many had to be lifted to their feet in the spring. The process of gladden, of course, destroyed much of the straw which could have provided winter feed for the cattle. It was not until 1735 that any hay was grown on the island; it was used to feed the stirks (young cattle). The small tenant and subtenant shared his house, and his oats, with his cow. Distemper and malnutrition was common. If a cow calved before the beginning of March, it was four or five weeks before she had enough milk for the calf, and the yield from the best cows was small.

Sheep were housed at night to protect them from the foxes. During the winter they received about the same care as milch

127 one thing, an attempt is being made to build up the value of
241 the sheep and cattle stock. Then too it is hard to obtain
231 information on personal income. Not a few Highlanders are
134 reluctant to share in the cost of maintaining the government
124 and, consequently, equally reluctant to discuss their income.
82 Still, it does give some indication of the potential income for 80 percent of the Skye crofters. It should not be forgotten that a large proportion of the small crofters will have absolutely no income from the land.

The Income of a Medium Croft. The medium croft, according to experts, has a potential income of £150 to £200 a year. Like the small croft, it provides a home, potatoes, vegetables, milk, eggs, meat, and peat. The budgets for one croft of this classification for 1952 and 1953 show a cash income of £203 17s 2d. and £170 15s. 11d., and a net profit of £169 12s. 1d. and £96- 11d. The marked fall in net profit is accounted for by a decrease in the acreage under oats, increased expenses, and the sale of fewer and younger stock, which also affected the cash income. The total hours devoted to crofting are estimated at 600 to 800 hours.

This croft supports a family, a married couple and their children, supplemented by seasonal auxiliary employment on the part of the father. As presently worked and stocked, it could not be left to a woman with any expectation of the same return. The stocking is two cows and followers and fifty sheep. There are 16½ acres of cultivated land, all but a quarter under grass

427 This budget is nearer the estimate of the local Depar

Nor does it normally, if ever, provide peat for fuel.
peat is there, of course, but the crofter does not hav
to dig it. Indeed, if he were to take the time or hir
one to do the digging for him, the cost of peat, in te
man hours approximately £10 a ton, would make it uneco
especially since it has only a quarter the caloric val
coal which he can and does buy for less. Like the sma
subjects, the large croft provides vegetables, meat, m
and eggs for the table. The sample budgets which I ob
for a large croft show a cash income of £536 11s.5d. f
and £802 7s.1d. for 1953. The difference is explained
part by increased sales of stock and in part by increa
government subsidies. The net profit for the two year
a far different story. In 1952 it was £829 6s.5d., bu

Barley was pulled by the roots. The oats were either stored in a byre or built up in a stack near the house to be used as needed. The process of dressing was known as gladden. A woman took a handful of stalks and set fire to it. As the husks burned, she beat the grain with a flail, a stick or bunch of heather. Using gladden, it was possible to dress, winnow, grind, and bake the oats into cakes within an hour. Kilns came into use in the late seventeenth century, but kiln dried grain was considered inferior to grain prepared by gladden. A few water mills had also been built at the close of the century, but they were also unpopular. The barley was stripped from the stalks, which were used for house thatch, and ground in a stone morter for griddle cakes or, later, for whiskey. The rye, like much of the Oats, was used as porridge.

Stock and Its Importance. The Skyeman, in contrast to the Lowlander, was primarily a pastoralist. The stock included a small, hardy, shaggy breed of cattle well adapted to the rough terrain and excessively wet and windy climate, a small, narrow framed sheep of limited value for meat or wool, ponies, goats, and pigs. The importance of the cattle may be judged from the valuation of the farms. Although the Norse system of land measure had replaced the pre-Feudal Scottish measure known as a devach,[64] the amount of land required to support ten head of cattle, with a monetary measure of mark lands, which were divided into penny lands and smaller units based on

. The foregoing facts and figures should make it
tly clear that a man with less than ten acres of arable
d with a "souming" of less than three or four cows and
heep can expect only a meager and definitely inadequate
for his investment of time and money. Several crofters
thirty or forty acres were required. This would mean
ing" of 10 or 12 cows and 200 sheep, if the present pro-
of grazing land to cultivated area were maintained.
id 300 to 500 sheep would be closer to the mark in order
a good living on the land. The budget for the large
confirms this view, but even then we have seen crofting
ain a precarious element of risk. Most crofters felt
ith twice their present acreage and "souming" they would
d with a less hopeless proposition.[6] This, of course,
involve a further, coerced reduction in population. But
all a matter for future planning. What we want to know
contribution of crofting to the local and national
.

The Contribution of Crofting to the Economy

f we are to determine the value of agricultural pro- 231 241
from crofting, we must consider not only the crops and 651 657

[6]It is not only the Skyemen who want more land; see The
of the Commission of Enquiry into Crofting Conditions
rgh: Her Majesty's Stationery Office, 1954), pp.18-19.

stock grown for local household consumption and export but 241
also the subsidies and grants provided by the national govern- 231
ment. I hasten to add that it is impossible to estimate 651
accurately the specific contribution of crofting to the 657
economy of Skye. There is no available means of distinguishing the status of crofter from that of farmer in the annual returns of crops and stock or in the applications of farmers and crofters for subsidies and grants. Before getting down to pounds and shillings, we may find a brief digression to review the acreages of land devoted to crop and stock raising and the yields to be expected helpful in our attempt to understand the many problems under which the Skyeman labors.

The total area of Skye is approximately 447,000 acres. 311
Of this area, 422,415 acres were classified, in 1953, as rough 131
grazing.[7] The land under cultivation, excluding grasses, 238
was only 3,254 acres. There were 6,258 acres of grass intended 241
for use as hay and 12,339 acres of permanent grass or improved pasture. The remainder, about 2,500 acres, was unclassified.

The stock, in 1953, was 1808 dairy cows and heifers, 231
8,108 cattle, 143,422 sheep, 41,888 fowls, 436 horses, and 319 pigs.[8] The dairy cows are mainly beef breeds which give a low yield of milk. The sheep are primarily the hardy blackface variety but some crofters have cheviots, which produce a finer wool. For each sheep there are about three acres of grazing

[7]Agricultural Returns, June 4, 1953, Department of Agriculture for Scotland, Edinburgh, Scotland (in the files of the Department). These figures include adjacent small isles.

[8]Ibid.

and for each head of cattle, some forty-five acres. 231

The crops are not only limited in acreage but also in 241
variety. Since there were less than ten acres of barley, which was cut green for silage, it may be said that the only grain is oats. The yield of the 2292 acres of oats was a low twenty-nine bushels per acre. The variety grown (Sandy) is not a threshing oat. It is fed to the cattle in the sheaf. This, of course, means seed oats must be purchased in the spring. The only other crops of any importance were 587 acres of potatoes and 99 acres of turnips. The yield for potatoes was about five tons per acre and for turnips, fourteen tons per acre. These yields do not satisfy the needs of the Skyeman and his cattle. The hay was poor in both bulk and quality.

It will be seen from the preceding discussion that the 231
livestock industry is the basic factor in the economy. The 241
production of crops is of no more than limited secondary importance. Let us now look at the value of the agricultural 128
production on Skye in terms of locally consumed produce and exports. The following figures represent a collation of facts and figures generously provided by the Department of Agriculture for Scotland, the North of Scotland Agricultural College, and local officers of these bodies. For brevity, I have set them out in Table 2.

231
241

Pigs	6,000	....	6,000
Miscellaneous	5,000	5,000	....
Totals	£ 344,000	£ 178,000	£ 166,000

[a]Based upon assumed yields from crop acreages and stock reported to the Department of Agriculture for Scotland.

[b]Consumption includes an allowance for loss of stock.

The estimated income from the sale of stock and produce 434 231 241 amounts to some £66 per holding. One of my informants, an agriculturalist of wide experience, thought that the estimate was too high. He would put it at £126,000, or £55 per holding. In addition to the actual production, we must consider government subsidies and grants.

The most important subsidies are those on hill sheep 654 231 and hill cattle. Each of these average over £30,000 annually. There are also calf rearing subsidies, marginal land grants, and several other available sources of aid which amount to some £20,000 each year. Thus, the total income for the Skye crofters and farmers is increased by roughly £80,000. Production and subsidies together give an average income of about £100 per holding. We have already seen that the crofter's income may be either a fraction of this figure or several times the average income depending upon the size of his croft. To fully understand the significance of this fact and to explore further the evidence for cultural continuity, it is desirable to inquire into the seasonal routine of the crofters of Skye.

The Annual Economic Cycle

As crofts are delimited according to size and potential 221 income, the crofters may be classified as full-time, part-time, and spare-time pastoral agriculturalists. Obviously, all crofters who work the land will follow a similar schedule, performing more or less the same variety and succession of tasks. There are, however, significant differences in the

If May is considered a busy month, June duties are even 221 231 more pressing. Although the winter gales are over, the rainfall [132] has begun to increase. A succession and variety of demands are made on the crofter's time. Once again the sheep must be brought down to the "fank." This time the purpose is to mark the lambs. The males, unless one or two healthy specimens are selected for future use as rams, are castrated and smeared with a dye to indicate their ownership. The females are smeared and have their ears cut to signify both ownership and age. Like the dipping, this operation requires [476] the cooperation of the crofter and his family, the neighbors, and hired hands. Next the sheep without lambs are dipped [232] once again and given a dose of medicine for liver fluke and a variety of diseases. At the same time, the early hay and, [241] perhaps, the early potatoes are ready for harvesting. The end [543] of June brings the Highland Wool Fair in Inverness. If he [233] has Cheviot sheep, as most crofters do, the man must go to arrange for their wintering on the milder and drier east coast. Although Cheviots produce a finer wool than the more common Blackface sheep, they do not stand up to the incessant wind and rain of a Skye winter. If his wife can leave the children behind, she will accompany her husband. The old [534] function of the Fair, the sale of wool, has disappeared under [656] government price control legislation.

It is not unusual to have the early harvest delayed 221 236 until July, but even then the mowing may have to wait because [241] sheep must come first. On one of the dry days during the first

or second week, the ewe sheep are sheared. Shearing is an- 221 236 other cooperative task. The men and women work together [462] with only one significant division in their labor. Women never shear. Their task is to run the sheep through the pens and fold the fleece after the two men shear the animal. Another chore is added to the crofter's schedule at this time. He must begin to watch his sheep for maggot.

The haying season runs through July and August, depend- 221 241 ing on the weather. In August the sheep have to be dipped again [232] this dipping prescribed by law, and the wedder lambs (castrated males) are sent to market. In September, if the weather is favorable and the season has been good, the harvest of oats begins. The man works with a scythe. Women never cut. His [462] wife helps by binding the corn in sheaths by hand and making stoops in the field. Later she helps her husband build the stacks for winter storage. As in any summer month, the stock 221 231 requires attention. Cast ewe sheep (sheep over six years old) and old rams are sent to the Ministry of Food grading station at Kyle, on the mainland, to be graded for meat or to Dingwall to be sold at auction. Cattle sales are also held on the [432] island in September and again in November, but the full-time crofter prefers the Dingwall auction. The rainy season is [132] now, as noted, reaching its height. The pace becomes slower. October, November, and, perhaps, even December are spent trying 221 241 to dig potatoes and turnips. Too often the oat harvest has [232] yet to be completed and the sheep must receive their second statutory dipping. Sometime before the end of November the 221 236

must be packed for shipment. As November ends the rams 221 224
out out with the flock. 233
Winter is a slow season for men, but it is not an idle 221
on. The cattle must be fed. The man fetches oats or hay 233
his stacks and some turnips or potatoes from his storage
and carries the feed on his back to his cattle on the hill.
rarely does he keep them in a byre because to do so he
l lose the government subsidy on hill cattle. Although [232]
heep are now free from pests and most diseases, he must
ime to periodically walk the hill to check their condition.
few bother to feed the sheep in winter. Another task is [231] ●
utchering of a few sheep. While not quite legal until
year, one crofter justified his activity by asking,
t would we eat if we didn't kill our sheep?" Once in a
, he may also kill a steer, but unless several families
the meat, salt beef becomes rather monotonous.
The crofter's wife keeps busy all winter. Her routine, 221
n by helping at the fank a half dozen times a year and 462
the harvest, continues through all seasons. As far as [231]
actual work on the croft goes, she milks the cows, feeds 241
poultry, and cultivates her garden. When she is not cleaning
house, cooking meals, making butter or cheese, caring for
children, or looking after her husband's needs, she knits.
also does the shopping, either from a food van or on a [432]
ly visit to Portree. Men are as disinclined to shop as they
to wash dishes.

The Part-time Crofter. The part-time crofter follows much the 221
same schedule and shares the same succession and variety of
chores. Indeed, some are not so much part-time crofters as 469
they are part-time employees. As such, they are successfully 182
preserving a traditional economy no longer en rapport with the
surrounding twentieth century commercial world by depending upon
economic benefits of contractual relationships to the smallest
possible degree. One fellow saw the situation this way: "We
don't need factories and the like; what we need is something
that will give us time to attend to our crofts." Others feel [227]
that if they have to abandon the traditional way of life, they
might just as well leave the island for places where greater
opportunities for social activity are joined with relative
economic prosperity.

The part-time crofter has less land than the full-time 221
crofter and less need for cultivating all of it because he 241
has fewer cattle to feed during the winter. He, therefore,
devotes less time to tilling his soil. On the other hand, 221
although he has fewer sheep, the collective flock of his town- 231 ● 476
ship is almost always larger than the stock of a large croft.
Consequently, he spends more time dipping, marking, and shearing
sheep in cooperation with his neighbors. Hired labor plays 231
a minor role in the townships. Often the only hired hand is 464
one of their number who assumes the responsibility of shepherding
the flock. Some of the townships with club stocks, however,
have adopted the practice of paying each shareholder for his
labor out of the profits to encourage cooperation or to penalize
those who do not do their full share.

those who do not do their full share. 000

The year for the part-time crofter begins with the prepa- 221
ration of his fields. As a general rule both the man who spends 241
his winter working for the British Railways or away at sea, and
the one who finds summer employment near home is found on his
croft during this period. Following the example of the large
crofter some use a tractor while others continue to plough by
horse. More and more are tending to take advantage of the con-
tracting service of the Department of Agriculture and hire a
tractor and driver. Once the crops are in, the majority are
free until the lambing season. Conservative in his belief 221
that too much handling of the sheep is harmful or individually 233
faced with the almost prohibitive task of singling a small [232]
flock out of several hundred sheep, he tends to omit the March
dipping. During the lambing season, the several crofters of [476]
the township either take turns on the hill or hire a shepherd.
The first chore, then, which brings them together as a group
is the marking of the lambs and the first dipping of the sheep
without lambs. The July shearing and the statutory dips in
August and November are cooperative ventures shared by all
crofters no matter what size croft they occupy.

In sundry ways, economic interests, judged in terms of 231 ●
commercial efficiency, play a smaller part in determining the 432
economic cycle of the part-time crofter than in the case of the
full-time crofter. The part-time crofter does not think it
worthwhile to ship his few head of stock to the mainland
auction markets. He sells them locally at the tri-annual sales.

As far as I know only one attempt has ever been made by the 231 ●
smaller holders to sell their cattle at the large mainland 432
markets since the last drove left Skye in 1906. There was a
feeling at the close of the Second World War among the crofters
that they were not receiving a fair price at the local sales.
The Scottish Wholesale and Cooperative Society, which had be-
come interested in the Highland Problem, offered to handle the
marketing. Their cattle buyer, a man of wide experience, found
the Skye cattle to be of high quality and suggested shipping
them to the Stirling market. This is one of the largest in
Scotland has the advantage of attracting a full range of buyers.
Since the cattle were not at their best after the long sea
voyage, they were provided with hay and pasture for a week
after arrival. Unfortunately, a disease epidemic in the
South forced a postponement of the market. Nevertheless, they
arrived at the auction block in good condition. The prices
obtained, an average of £1 or £2 more than they normally re-
ceived at the local sales, convinced the crofters that there
was no advantage in selling on the mainland. Actually, if
the Society had not paid the expenses of shipment and feed,
the crofters would have suffered a slight loss. Those who
attend the Dingwall sales say they used the wrong market.

While the man who devotes all of his time to his 221
pastoral-agricultural occupation finds it uneconomical to 314
bother with gathering seaweed for manure, fishing, or cutting 241
peat, the crofter of the category we are discussing often
adheres more closely to the traditional cycle. After the

depend upon the women of Skye. 000

The Spare-time Crofter. Under this type we must include not 231 ●
only the able-bodied, married man who tends to become a full- 241
time wage earner, but also the old, pensioned, married and 287
unmarried men and women who are no longer able to perform
the necessary chores. For the latter, whether they have a
small or medium-sized croft, the croft becomes a means of
living within a pension rather than a potential source of
livelihood. For the former, the croft becomes a means of
living cheaply.

When the crofter goes out to work, he either tends to 231
neglect the croft or expects his wife to manage it. Oc- 241
casionally, the husband will help with the ploughing or the 313
harvest in the evening, but he never lends his wife a helping 462
hand in her domestic duties. The only men on the island that
I knew who helped their wives with the dishes or the care of
the children, except disciplinary measures, were a minister
from the Outer Isles and several Lowlanders in Portree. Since 312
very few crofters have plumbing, the wife must fetch water
from a well and dispose of waste in the nearest stream. If
there is to be a supply of peats, she must cut them. If
there are cattle and sheep, she looks after them. Lambing
may be left to the township shepherd if the crofters can afford
one, and shearing is usually left to the men of the township.
An exceptional spinster or widow may shear, but it is indeed
an unusual married woman who will break with the traditional

division of labor. During the summer, she will milk the cows, 231 ●
and in the winter she will see that they are fed. If there is 241
to be a harvest in the autumn, she will care for the crops. 313
462

Some women, in particular the older ones, plough with 241
the caschron, the foot plough. Other women use a small power 454
driven plough or contract with the Department of Agriculture 462
to have the ploughing done. The Department will also provide
the men and machinery to harrow, cultivate, spread lime and
manure, mow hay, cut and bind oats, dig potatoes, and thresh
grain. By utilizing these services, if they can be afforded,
the small crofter can free himself or, at least his wife,
from many arduous tasks. The need for cooperation of the family 476
and neighbors is thereby reduced. Although traditional mutual 453
aid is being replaced by cash payment for labor, it is not the [18]
labor of a landless working class which commercialisation often
creates, but rather state provided services. Significantly,
most Department employees are newcomers. The Skye man who
works for the Department is a better worker away from the island.
Since few are for sale for these services, the wife digs the 241
potatoes, and some women use the scythe to reap hay and oats. 462
The scythe, it will be remembered is really a man's tool.
Frequently, the break with tradition is avoided by the return of
a son from the mainland or the sea. Running the household and
working the croft is not all some women do. They also take in [185]
summer visitors, by the day or week, and provide teas for travellers.

In summary, it may be said that crofting is anything but 241
an easy life with ample rewards. We have seen how meager the

manured, harrowed, and limed his fields. Normally, he will 221
have a tractor to speed his work. In the meantime his wife 241
prepares her small kitchen garden. By the time he has sown [462]
his oats and set his potatoes and turnips, the ewe sheep are 221
ready for lambing. Lambing begins during the last week or two 231 ●
of April and runs through the middle of May. This is one [462]
activity which is exclusively man's work. It is also a chore
which demands an early start from individuals who are normally
late risers, seldom getting started before eight or nine in
the morning. Now, all day long, from early morning until late
at night, day after day, the crofter or his shepherd are found
on the hill watching and waiting for the lambs and their
natural enemies, the crow, the hawk, and the fox. During this
time, he does not neglect feeding his cattle nor finishing
putting in his crop if inclement weather has hindered his
progress. Then, too, he may have a cow ready to calve. His [463]
wife will then add milking to her regular household duties.
Men have only recently begun to milk.

After lambing, the family must decide whether or not 221
they are going to take time out for cutting peat. As I have 314
already said, it is unlikely that the man of the house will
want to bother. He has enough to do caring for the sheep and 221
lambs and preparing his cattle for the May markets. Although 231 ●
he could attend the local sales which are held at convenient 432
locations around the island, the large crofter has found the
mainland market of Dingwall attracts buyers willing to pay
higher prices.

361 The number of holdings which can be carved from the land
631 in any one place and the proximity of these clusters of crofts
162 to each other are determined to a large degree by the limiting influences of the environment. Landforms, climate, and soil have always restricted settlement to the coastal fringe and a few internal glens. Although the Sgiathanach has abandoned his former dependence on a subsistence economy, the original cultural adjustment, these natural features continue to exert a negative influence. Each man must have some arable land to provide winter feed for his cattle and to winter his sheep.

If the low-lying area is small and isolated, only a few holdings can be laid out. If the fertile area is large, the influence of the environment is less direct. In either case social and economic factors are important. The small isolated townships are invariably unsuccessful. A few, like Point of Sleat, are completely empty. Others are all but derelict. There is Kylerhea in Sleat where no children have been born in over fifteen years. Suisinish in Strath, a township well remembered from the days of the "Clearances," when a minister's sheep replaced the inhabitants, is now inhabited by an old man and his two elderly bachelor sons. All of these
427 failing townships are at the end of a road. Whereas the
231 minimum size was once four able-bodied men, the number in a
162 plough team or a boat crew,[12] it is now three. This functional trio is indispensible for the care of a sheep stock large enough to be worth keeping. Even three families do seem to satisfy the social minimum.

[12] Ibid., pp. 1-2.

241 where the population has suffered the greatest decline and,
161 therefore, where enlargements, by legal or illegal means,
433 have been the most extensive, crop production has declined the most. Nor has the decline in population, accompanied by land redistribution, altered the fundamental problem.

427 The cottars (subtenants) have almost disappeared there-
241 by easing the excessive pressure on the land and removing the threat of recurring destitution. Today they are found only in a few scattered dwellings and isolated clusters. Most of them have secured some form of employment or have reached the age when a government pension is sufficient to satisfy
427 their needs. The number of crofters, on the other hand, has
241 increased. If the figures 2043 and 1227 can be accepted as
161 nearly correct for the respective numbers of crofters and
162 cottars in 1886,[15] they have increased at the expense of the latter and, also, the sheep farmer, whom they have replaced.

632 To briefly summarize the foregoing discussion of the
621 township, let us look at Kilmuir. Table 3 shows the number
161 of crofts and crofters in each of the nine townships together
162 with the acreage and "souming" rights available to each indi-
241 vidual. Although replanning during the past fifty years has
427 benefited many of the local residents, crowding upon the land
241 is still apparent.

[15] L. MacDonald, The Past and Present Position of the Skye Crofters, sheets 6, 17.

TABLE 3

161 CROFTS, CROFTERS, ARABLE ACREAGE, AND SOUMING RIGHTS
162 IN THE KILMUIR TOWNSHIPS

Township	Crofts	Crofters	Arable Acres[a]	Common Grazing	Souming
Bornesketaig	47	35	4	273	2 cows, 1 calf, 12 sheep
Hunglladder	14	9	5	236	2 cows, 1 calf, 10 sheep
Balgown	4	5	13, 14, 36, 46, 66	177	4 cows, 4 calves 26 sheep
Kilvaxter	12	11	27	...b	4 cows, 4 calves 26 sheep
Linicro	19	17	15	729	5 cows, 5 calves 40 sheep 1 horse
Peingown	3	4	18	187	7 cows, 7 calves 20 sheep 1 horse
Herbusta	8	8	12	308	3 cows, 3 calves 26 sheep 1 horse
Totescore	12	13	21	500	3 cows, 3 calves 20 sheep 1 horse
Monkstadt	3	3	27, 27, 5	420	9 cows, 9 calves 40 sheep 2 horses

[a] Arable acres are given in average acres per holding, unless otherwise indicated. Except in Bornesketaig and Hunglladder, arable land includes outrun, improved pasture land individually held.

[b] Shared with Kilvaxter.

worth while to cultivate any of the arable, so I use it for 636
grazing." A case which aptly illustrates the influence of 633
the township system as an agent of conservatism is the breeding 621
of pigs. Although several old crofters told me how many 632
people during the times of the "Clearances" kept a pig, they 774
are rarely found anywhere in the Highlands today. The Biblical 163
injunction against the flesh of swine has been taken literally. 621
The older people simply have a strong aversion to handling 636
pigs. One man, a very successful cattle and sheep breeder, put it this way: "Pigs are filthy brutes. I just don't want to touch them -- I never have kept any and never will." At the same time, there are men who believe that the prices these animals bring at the mainland markets more than compensate for the individual's revulsion, especially as long as the Ministry of Food pays for the cost of transportation. These men cannot try branching out because they have no way to restrict the foraging animals. "Skye is ideal for pigs," one young fellow told me, "but I don't have the freedom to work the croft to suit myself."

Smaller deviations from the traditional methods of land 621
use face the same difficulties. A progressive crofter who 632
attempts to improve the value of his stock by growing scientific 626
mixtures of grasses is always penalized. As soon as the harvest 232
is over, the stock of all his neighbors will show their ap- 241
preciation by concentrating on his croft, trampling his fields, 178
and overgrazing his grass. Nor is this his only penalty. His neighbors will regard him with skepticism for his departure from the ways handed down from the past.

83 Arduous is difficult to determine. In the winter of 1953, I
241 helped a small crofter thrash oats, a cooperative enterprise
123 even with a mechanical thrasher, supplied by the Department of Agriculture. The neighbors who came over to lend a hand were two men and three women. The youngest woman would never see fifty again; her seniors were seventy-seven and seventy-eight. The youngest man, who had just been married, was sixty-three; the other seventy-three. These crofters not only showed more endurance than I did, but put me to shame by carrying the sacks of grain from the field to the byre
162 at the end of the day. Nevertheless, most of those over seventy, about 15 percent of the population, do not make use
827 of the land for more than growing a few potatoes. An old
231 man cannot keep a cow because, as one man said, "You can't
462 have a cow unless you have a woman to milk it." If he is married or lives with a sister, there may be a cow and a couple of sheep. An old woman may have her cow and sheep if she is strong enough. There comes a time, however, when all the old people will only remember the work involved. Still, they will say, "Och, but they were good for all that."

427 Absentee tenants are responsible for depopulation on
241 the one hand and falling production on the other. A reasonable
161 estimate would be 300. Their number could be as high as 400.
433 Some townships have over 50 percent of the crofters absentee. The only townships which do not have this problem are the few which contain large crofts. On one small estate there are seventy-six crofts, held by seventy-two crofters. Only thirty

427 of the holders reside on their land for more than half the
241 year. The lowest rate of absenteeism is found among the tenants
162 of the Department of Agriculture. There are 76 absentees out of a total of 667 tenants. Most of the non-resident crofters are permanently absent. On the small estate mentioned above thirty-seven of the forty-two absentees have not been seen in years. Five of them usually return to Skye to spend their summer vacation.

427 Thus, we have a situation in which, perhaps, a third
241 of the crofts are held by people who either cannot work them
311 because of old age or infirmity, or do not choose to work
827 them because of greater opportunities elsewhere. What, then,
231 happens to this land? Some of the old people allow a neighbor to use the land. Almost invariably this means the few fertile acres will be used for grass and hay. Absentees "entrust" the
670 croft, house and land, to a landless family. While Parliament inadvertently gave the crofter a right to keep his holding whether he resided on it or not, it is illegal to sublet. So far, this has not concerned the crofters. Other absentees "entrust" the land to someone in the township who uses it for grass.

427 Turning to the influence of old age and absenteeism on
241 stocking, we find a series of entanglements. If the township
231 inhabited solely by old people, like Aird in Sleat, the township becomes derelict. More commonly, the absentee and the old person allows someone else to take over his "souming" so
329 that some crofters have far more than their share. Not infrequently, this gives the crofter a chance to outwit that

427 "rich man, the government." Since subsidies depend
887 number of stock, he may forget that all or part of h
231
829 has been given away. One old crofter, for example,
ago asked a young lady to fill out his agricultural
She knew his estimates gave a great deal of reason
his veracity, but, preferring not to question the p
entered his figures. When it came time to sign the
he was canny. "Och," he said, "just put a tremble
and sign it yourself." There are other crofters wh
the authorities by returning the same number of cat
sheep year after year. Although even the best croft
farmers lose a few sheep and an occasional cow, the
[625] that their stock has produced as many as have been
a means of protecting the government from paying fo
existent stock, the police have to be notified when
stock counts are to be made. Even when they do sup
counting, allowances for stragglers have to be made.

654 So pernicious is the effect of non-residence
427 crofts, that a recent government commission has rec
888 severance of the house from the land in the case of
and the eviction of the absentee, as a means of bol
economy and alleviating the widespread condition of
427 husbandry.[17] This could be the final blow for the c
888 uncommonly, the croft is subjected to both absentee
infirmity of old age. The heir does not return unt
passed the age of retirement and begins to think, "

311

[For further information on land use by crofters, see category 241.]

178 311 232 233 land is reduced if his application is granted. Also, a group of men in a township may apply to the Crofters Commission for permission to fence off a portion of the common grazing land and improve it as grazing for their mutual use. Grants are available for both schemes. The township reseeding schemes, adopted widely after their introduction, have been superseded by the number of individual apportionments.

The first township reseeding schemes in Lewis were tried as an experiment in Ness, Harris, Barvas and Bragar. [654] "The Department of Agriculture fellow watched us every step because it was an experiment. Oh, there were times we cursed him and wanted him away." In Shawbost, a few interested crofters went around the village to see if others were interested. "We got a bad name for it; no one could see anything to it. But those people got the benefit of it." According to one man, initial reluctance to participate in the schemes was overcome when the agricultural advisor pointed out that if they overstated their costs, they would not have to pay much money themselves.

Between 1959 and 1962, seven township reseeding schemes were developed in North and New Shawbost, and four in South Shawbost. They were intended to give

171 175 427 241 typical homestead or "farmtoun" consisted of a "ploughgate" occupied by eight tenants, each of whom contributed one animal to the common plough and thus had an eighth of a share of land or one "oxgate" (Grant 1930: 97).

175 427 241 [476] [407] In the Highlands and particularly in Lewis, about four to six men and their families worked together and shared land which was held in run-rig. The Old Statistical Account (1796) lists 90 ploughs in the parish of Barvas or about one plough per five families (Geddes 1948: 57). Geddes maintains that joint tenants 175 427 241 114 233 paid an equal share of the rent and had equal "soumings" (the number of stock allowed on the common grazing land). In contrast, Walker (1812: 56) says that joint tenants paid different rents according to the share which they had in the arable land, and that the number of cattle which a tenant had on the common grazing land was soumed or proportioned to his rent; all the tenants worked the arable land together, and received a percentage of the produce which was appropriate to their share. Geddes' description (1948) emphasizes equality within the joint farm; Walker (1812) and Gray (1952) point to differences between tenants and subtenants.

311 who wanted to keep his bullock on the reseeding for
233 another week because he wasn't ready to sell it; but
●232 he should have known the rules. Some people want to
829 keep both cattle and sheep on at the same time, although the agricultural advisor says cattle should go on first, because sheep go for shorter grass. Other people want to put on twice as many sheep as those who have both cattle and sheep. When they stop keeping cattle, they think they're not getting a proper share of the reseedings.

"The Crofters Commission wanted communal township schemes. But people have different demands. It's better to go for an apportionment. You can do what you want with your own land."

178 The number of township members participating in
311 the communal schemes is diminishing to the point where
232 it is less expensive, and much less subject to conflict
423 arising over differences in stock-keeping, to invest in
476 individual holdings of land rather than try to sustain communal practices.

175 Whatever the rationalization, cobbler fathers begot
827 cobbler sons. The present postmaster's grandfather was
463 the first postmaster in Shawbost, and when help is needed
[205] in delivering the mail it is the postmaster's first
[767] cousins who are likely to help out. As late as the 1950's, the township still had its own undertaker, a man who had learned from his father the art of laying out and dressing the body but who didn't like the job very much and was happy enough to turn it over to an undertaker who traveled from Stornoway.

463 The island has had a veterinarian, based in Stornoway,
●[232] for the past 30 years or so. Earlier, certain blacksmiths and farmers treated ailing livestock when the crofters
[278] needed them. For human ailments, there were many cures
[755] by plant and spell.

463 The man who was the last village blacksmith died
326 not long ago. His smithy was in the center of the village.
[342] His home and smithy were mortared stone buildings with corrugated iron roofs that were once estate houses for the men who worked the experimental farm established by Sir James Matheson in what is now New Shawbost. The blacksmith was also a shopkeeper and butcher. As a
463 blacksmith, his work was principally shoeing horses and
326 making harrows and peat-cutters, which he did with the
874 aid of one and sometimes two apprentices. One of his

Appendix C

Balance Sheet of a Croft

*159 "The Muillear" has one croft and a two-acre buaile.
241 In 1970 he planted one-eighth of an acre with three bags
244 of potatoes, two of which he bought for L14/16, and
433 harvested 22 hundredweights. This was sufficient for
[435] his family's needs and provided some feed for his livestock for all but two months of the year. A small plot is planted with cabbages, for domestic consumption.

[311] Seven-eighths of an acre is planted with oats; one-
[246] and-a-half acres with grass and hay; and two acres
[233] are used for rough grazing.

*159 The Muillear is interested in new ideas and technique
●232 He goes to meetings and discussion groups sponsored by the
233 North of Scotland College of Agriculture, and has bought prize rams from the mainland to improve his flock. He tries to raise a few sheep using techniques of good husban rather than a large flock which would be given less effective care. He is teased by other crofters for "over-feeding," and for keeping his sheep on the croft and the township reseeding rather than out on the moor. "His shee get homesick when they get out of sight of the croft." He wins the prizes at the Carloway Cattle Show each year, in

*159 •232 233 quietly triumphant yet unassuming way. He does not kill any of his sheep for home consumption.

*159 241 288 434 His involvement with the croft is a "hobby" because its output does not compare with the income he receives from weaving. Whereas he might make as much as L100 from his crofting activities, his income from weaving averages [651] L7-800 a year. As a married man, he can earn as much as L848 without paying income tax.

*159 233 434 654 Income:

Sheep:	L27/--	(three sheep sold to the slaughterhouse in Stornoway)
	1/16	("Fat Sheep Subsidy" for the three sheep that were sold)
	16/10	(Subsidy of 12 shillings each for 11 shearlings and six sheep)
	22/10	(Prize money from the Carloway Cattle Show)
	12/10	(Three lambs sold locally)
	12/ 8	(Fourteen fleece sold to the Wool Marketing Board, at an average of 3/11 per pound, or about 17/6 per fleece. The island tweed mills pay only 2/5 per pound. He has been sending his fleece to the Board for two years. Many crofters prefer not to bother with the Board, and sell their fleece to the mills. They are the only sheep-owners in Britain who have this option, because of the location of the Harris Tweed mills on the islands. But as of 1970-71, the mills refused to buy fleece.)
	L90/14	
Cattle:	L28/--	(Calf sold)
	11/ 5	(Subsidy for the calf)
	18/ 5	(Subsidy for the cow)
	L57/10	
Total:	L165/14	

*159 233 434 654 236

175 433 434 [182] [311] •[232] [422] natural zone, could not be extended. In any case, the reclamation of clay land tended to slacken as efforts turned to fishing and kelp-making. The introduction or increased growing of potatoes added to the human, but hardly to the animal, food supply. Finally, while the beginnings of medical knowledge and vaccination had aided the growth of population after 1750, veterinary science had made no progress, nor did it advance in the Island for many years to come. We may conclude that an average stock per Island family about 1720 was rather more than that of 1790, and the acreage relatively larger, while both were greater than the average of today, particularly in the Lews.

175 262 244 What, then, could a family have to eat, from such crops and stock? While in winter even now there is almost no milk to be had on a croft, and there would be little then, there was salt meat, dried or salted cod (or herring) and fish oil; oat and barley meal and some rye meal; cabbages; and, increasingly in the eighteenth century, potatoes. Martin included potatoes among the crops grown even on far St. Kilda in 1697. A century later it was written that the people of Uig, for instance, had, though 'unwilling', been induced to grow and eat them 'forty years before'; and the years tend to be under-estimated where changes are slow and memories long! But it was written of Harris that by June the meal and potatoes had mostly been consumed, "and such as cannot afford to purchase imported meal subsist chiefly on the milk of their cows and sheep, with what fish they may chance to catch, till their wants are relieved by the first fruits of their potato crops early in Harvest".

175 511 162 171 We conclude that with even less money but a little more grain the population in the Island had fluctuated about a mean for some centuries before, as it had in so

175 554 565 427 seldom agreement as to which of these three types brought the greater good or wrought the lesser evil. As elsewhere, tacksmen declined by the end of the eighteenth century. Buchanan wrote in 1793, "The greatest tacksman in Lewis is the Laird's ground officer"; but he added that the Island was for the most part inhabited by tenants holding directly from Seaforth, who "easily perceived the folly, as well as the inhumanity, of lending out the people on his island to imperious tacksmen, for the purpose of raising fortune to themselves on the ruins of the unfortunate subtenants". At a later date a former Chamberlain of the Lewis estate, John Munro Mackenzie of Calgarry, held otherwise. To the Napier Crofters' Commission in 1883, he said: "Till the beginning of this century the greater part of the Lewis was in the hands of tacksmen, or middlemen, who got in some cases from their subtenants in money, produce, and labour, what nearly paid their rents". Their names were those of the seventeenth century. Early in the century, "when Mr. Stewart-Mackenzie married the Hon. Lady Hood, daughter of Lord Seaforth, and took the management of the estate into his own hands, he did away with the middlemen, and let the land direct to the crofters. •[232] This, no doubt, was a step in the right direction, but it had its disadvantages, as the example of a good middleman, who looked after his people, and who was industrious in farming . . . and stock-breeding, was beneficial to the people, though in some cases they may have been petty tyrants." He might no doubt have added that they could, if need be, stand between a bad factor and the crofters.

[228] When they lost their tacks, some of these 'middlemen' turned to the growing fishing industry and helped to supply capital and enterprise as curers; their successors were active through the nineteenth century and I spoke with

232 APPLIED ANIMAL SCIENCE--practical and scientific knowledge about animal husbandry; veterinary science; specialized knowledge of animal nutrition and disease control; selective breeding of animals; artificial insemination; raising of hybrids; special elaborations (e.g., raising and breeding of racehorses); veterinary services and fees; etc. See also:

Horseracing . . . . . 541 Zoological science 816

233 hundred and thirteen - but most crofters had from forty-five to one hundred and twenty. Wedders are sold at two-three years old when the mutton is said to be at its best.

231 Parts of the common pasture - usually the machair, are set aside for wintering hogge
[427] but the usual practice is to keep as many as possible on the croft. The soum as a whole is not enforced but shares in the wintering parks are adhered to. For example:- Timsgarry Glebe is leased to Crowlista and one share entitles a crofter to winter twenty-five hogge on it. In Ardroil one share allows one cow or four yearlings or eight sheep or eight hogge
[232] on the machair - in practice it is the best hogge that are sent. The minister at Timsgarry, who is much interested in sheep husbandry, has bred a heavier sheep with longer legs by crossing the Hebridean blackface with Swaledales and these seem to be doing very well; the minister is more attentive to his sheep than are many of the crofters, but some local crofters are showing interest in this crossbreed. The lambing percentage, so dependant upon the winter and spring weather, was about 80% in 1959 and this was regarded as good.*

Enquiries show that some crofts in each township far exceed their souming but because others carry no stock the four townships are understocked according to the total soum, here expressed in cow units. Sheep stocks in Timsgarry approximate to the sheep soum, Crowlista is overstocked by 130%, while the other townships are understocked.
[239] Some of the figures used for sheep stock were approximate or estimated. Nearly all crofts keep some poultry and surplus eggs may be sold to the grocery vans.

The rhythm of work on the croft during the year is shown on Figure 16, overleaf.[1]

241 Part of the hill common west of Crowlista was cultivated until the beginning of the
195 present century, at which time the township was overcrowded with two or three houses on
[361] each croft. A similar area west of Carnish was cultivated and old lazy beds, now grazed, are to be seen on slopes south of the road in Ardroil, in the valleys of Amhuinn Thoraghain and Allt a'Gharaidh and on the Borranish peninsula. The ruined shieling huts for this area, still to be seen around and beyond Loch Suainaval were in use until 1934 - '35. (Figure 5).

464 Ancillary employment is sought by all but nine of the thirty men under sixty-five in these townships and the wives of two of the 'full-time crofters' have regular employment.
228 There is no commerical fishing by local boats though the Bernera lobster boats are seen frequently off Uig Bay. The ruined curing house and piers at Crowlista, and the 'port' shown on the O.S. map near the site of the clachan in Carnish, point to the former importance of fishing.

288 At present the weaving of Harris tweed from yarn supplied by the Stornoway mills is more lucrative. There are two looms (plus one other weaver) in Carnish, two in Ardroil, three in Timsgarry and two (plus one other weaver) in Crowlista. All these looms were in use and two tweeds woven a week bring in a useful income but the supply of weaving is irregular. The future security of these weavers depends on the prosperity of the Harris tweed industry.

464 Mitchele's sand and gravel quarry at Carnish provides employment for from three to
316 ten men. Five men from Ardroil and one from Carnish are employed there at present.
312 The Aird R.A.F. station draws most of its civilian employees from Aird Uig but two
377 Ardroil men work there. One Crowlista man is employed at the hydro-electric shceme
446 site at Gisla and this work will last for another year or two. Employers recognise the particular needs of their crofter employees and 'days off' are allowed for sheep fanks and other necessary work.

* The minister's ewes gave 103%.

1. [For Fig. 16, see page preceding p.38--Analyst]

231 Cattle are kept on 162 of the 219 units; in all there are 180 cows of three years and over, 47 young cattle, and 110 calves. The usual practice is to suckle the calves, and sell them as soon as they qualify for the calf subsidy; lack of winter-keep is one of the reasons for this practice.
[254] The breeds of cattle are mainly Shorthorn and Aberdeen Angus with a few Highland cattle. The other function of the cow is to provide milk for the household; households without a cow rely
[432] mainly on tinned milk. Cattle are sold at the twice-yearly market held at Garyvard, but prices fluctuate greatly. The townships of Park certainly do not carry a full souming of cattle.

231 Sheep are more important than cattle in the crofting economy in Park. The breed is the
233 Lewis Blackface, a small, lighter type of the Scottish Blackface breed. The sheep are pastured
233 on the common grazings in summer, and are grazed on the croft land in winter. The standard of
[292] sheep husbandry is also low as few crofters dispose of cast ewes or have a defined breeding policy as all stocks mingle freely on the commons. The lambing percentage for 1958 was about 60 per cent and the number surviving in August compared to the total ewe stock was 52 per cent,
[435] but it was generally agreed that 1958 was a poor year. A further indication of the quality of the sheep is that in the fishing townships, a ewe fetches from 35 to 50 shillings, and a lamb about 20 shillings locally. The low lambing percentage and poor prices can be partly ascribed to the lack of good grazing and to overgrazing, but disease and losses in a treacherous common pasture raise the mortality rate. In general the sheep are left to fend for themselves with a minimum of shepherding although the more progressive crofters hand-feed the ewes and hogge in bad weather.

The majority of the crofters in Habost and Kershader, and a minority in Garyvard, rent additional grazing in Park Deer Forest, paying a fixed sum for each sheep. Sheep from these townships fetch better prices; in the other townships a few wedders and fewer cast ewes are sold to the
[256] Stornoway butchers. In many flocks, wool provides the only income from sheep.

It is evident from Table II that the sheep souming is greatly exceeded. In the calculations, ewes are taken as one unit, and 'other sheep', wedders and gimmers, have been calculated at half rate. On this basis, the overall sheep souming is exceeded by 70 per cent and in only one township is the stock comparable to the souming. Overstocking has been encouraged in crofting districts by the ewe subsidy which was in operation till 1956 and it is notable that the rise in numbers of sheep recorded in the Outer Isles coincided with the introduction of the Hill Sheep subsidy in 1938.[1] Overstocking is without doubt the chief reason for the high mortality rate in sheep. Calculation of the overall relation of the actual cattle and sheep stock to the soum shows that the common grazings of Park are overstocked by 14 per cent. It is, however, impossible to calculate an exact figure, as the number of sheep grazed in Park Deer Forest was not enumerated. It is also evident from the individual croft surveys that the cottars, squatters and feuars, who have no rights of grazing, have stock equivalent to 157 cow units or 12 per cent of the total stocking. Thus the crofts of Park are maintaining an average stock fairly close to the souming, but the cattle-sheep ratio of 1:28 is too low for proper management of the pastures.

In general, a low standard of husbandry obtains in Park but it is clear that the agricultural townships are much more efficiently operated than the fishing townships. Overstocking occurs in seven of the twelve townships and sheep stocks are, with one exception, higher than the sheep souming.

1 In Scotland as a whole, the number of sheep recorded declined from 8,007,134 in 1938 to 7,336,000 in 1955.

amount of time which is allotted to each activity and in the 22
pressure on the crofters to complete each chore within a relatively definite period. There are also differences in the number of non-crofting activities in which the individual can or must engage. Let us follow several crofters through the year to see what these differences are.

The Full-time Crofter. One might say the year for the full- 22
time crofter begins during the first week of January when he 23
goes out to the hill to bring in his rams. This is the first break in the monotony of his winter schedule, but it is only a momentary break. Not until March does his season of prolonged labor begin with the first "dipping" of the sheep to rid the animals of tick and parasites. He and his wife, [476
their children, if they are old enough, and their neighbors or hired hands, crofters from nearby townships, join forces. Several of the men go off to the hill to gather the sheep and herd them down to the "fank," a stone or sheet iron inclosure consisting of either two or three pens, a trough for the "dip," and a shearing platform. While waiting for the sheep, the remaining men and women prepare the "fank" for the day's work. One by one the sheep move through the pens until all have been picked up bodily and submerged in the medicinal bath. The women not only help their fathers and husbands at [46
the "fank" but also prepare a noon meal for the group.

Following the dipping, the crofter turns his attention 2
to the soil. By late March or early April he has ploughed, 24

If May is considered a busy month, June duties are even more pressing. Although the winter gales are over, the rainfall has begun to increase. A succession and variety of demands are made on the crofter's time. Once again the sheep must be brought down to the "fank." This time the purpose is to mark the lambs. The males, unless one or two healthy specimens are selected for future use as rams, are castrated and smeared with a dye to indicate their ownership. The females are smeared and have their ears cut to signify both ownership and age. Like the dipping, this operation requires the cooperation of the crofter and his family, the neighbors, and hired hands. Next the sheep without lambs are dipped once again and given a dose of medicine for liver fluke and a variety of diseases. At the same time, the early hay and, perhaps, the early potatoes are ready for harvesting. The end of June brings the Highland Wool Fair in Inverness. If he has Cheviot sheep, as most crofters do, the man must go to arrange for their wintering on the milder and drier east coast. Although Cheviots produce a finer wool than the more common Blackface sheep, they do not stand up to the incessant wind and rain of a Skye winter. If his wife can leave the children behind, she will accompany her husband. The old function of the Fair, the sale of wool, has disappeared under government price control legislation.

It is not unusual to have the early harvest delayed until July, but even then the mowing may have to wait because sheep must come first. On one of the dry days during the first

or second week, the ewe sheep are sheared. Shearing is another cooperative task. The men and women work together with only one significant division in their labor. Women never shear. Their task is to run the sheep through the pens and fold the fleece after the two men shear the animal. Another chore is added to the crofter's schedule at this time. He must begin to watch his sheep for maggot.

The haying season runs through July and August, depending on the weather. In August the sheep have to be dipped again this dipping prescribed by law, and the wedder lambs (castrated males) are sent to market. In September, if the weather is favorable and the season has been good, the harvest of oats begins. The man works with a scythe. Women never cut. His wife helps by binding the corn in sheaths by hand and making stoops in the field. Later she helps her husband build the stacks for winter storage. As in any summer month, the stock requires attention. Cast ewe sheep (sheep over six years old) and old rams are sent to the Ministry of Food grading station at Kyle, on the mainland, to be graded for meat or to Dingwall to be sold at auction. Cattle sales are also held on the island in September and again in November, but the full-time crofter prefers the Dingwall auction. The rainy season is now, as noted, reaching its height. The pace becomes slower. October, November, and, perhaps, even December are spent trying to dig potatoes and turnips. Too often the oat harvest has yet to be completed and the sheep must receive their second statutory dipping. Sometime before the end of November the

wool must be packed for shipment. As November ends the ra are put out with the flock.

Winter is a slow season for men, but it is not an idl season. The cattle must be fed. The man fetches oats or h from his stacks and some turnips or potatoes from his store pits and carries the feed on his back to his cattle on the Very rarely does he keep them in a byre because to do so he would lose the government subsidy on hill cattle. Although the sheep are now free from pests and most diseases, he mus continue to periodically walk the hill to check their condi Very few bother to feed the sheep in winter. Another task i the butchering of a few sheep. While not quite legal until last year, one crofter justified his activity by asking, "What would we eat if we didn't kill our sheep?" Once in a while, he may also kill a steer, but unless several familie share the meat, salt beef becomes rather monotonous.

The crofter's wife keeps busy all winter. Her routin broken by helping at the fank a half dozen times a year and with the harvest, continues through all seasons. As far as the actual work on the croft goes, she milks the cows, feed the poultry, and cultivates her garden. When she is not cl the house, cooking meals, making butter or cheese, caring f the children, or looking after her husband's needs, she kni She also does the shopping, either from a food van or on a weekly visit to Portree. Men are as disinclined to shop as are to wash dishes.

of tenure function to protect the individual from potential 178
abuses by a landlord where customary usages once fulfilled the 182
need. Moreover, even though the tenure of the cultivated soil 423
grants all the rights of a landholder, including the rights 427
to bequeath the house and land to a member of one's family, 657
for more than half the year it is used communally.

The Sgiathanach has never adjusted sufficiently to become 178
a specialist, not even a specialized grazier. For him the 423
land has always had a more fundamental value than merely being
a means of livelihood. It is the ancestral home. There is a
sentimental attachment to the land which is an expression of
the affectionate bonds of kinship. The people have never lost
the tribal tie of the land and the group. Although the former
patriarchs disclaimed any sympathy with this point of view,
the landlords on Skye today have kept what little land they
have only because of its sentimental value. Indeed the atti- [656]
tude of the largest landholder, the government of Scotland,
is that the crofting tradition is worth while preserving, if
for no other reason, because in the predominantly urban and
industrial civilization it has a romantic value. There are
other reasons. The Islands have long been looked upon as a [702]
human reservoir for the armed forces, and, more recently, for [464]
Lowland industry.

As a result of their partial adjustment to the higher 178
socio-cultural level, there have been changes in crops and stock. 231
The British market has influenced the crofters' output, within 241
ecological limitations. The old subsistence crops of oats and 433

extra grazing for cattle, but by that time the cattle were already on the wane.

"The original idea was to provide an early bite for the cattle, because everyone had cattle then. Otherwise they would need to buy more baled hay to see them through the winter."

"Almost everyone in New Shawbost had a share in the 1959 schemes, about 26 altogether. Then it was mostly cattle. We took turns bringing them in at night, and I remember taking 33 home, with some left behind for the night. The cattle were grazed over the summer, and the lambs were put on from August 10 to October 10. Many dropped out after the first four or five years, when they stopped keeping so many cattle. When the number dropped to 13 or 14, they started using the schemes for mixed grazing, and then some took up their shares again. When we only had the cattle and lambs, we didn't need a souming; but when the mixed grazing started, we had to keep down the number of sheep. Last year we had difficulty with disease."

A forty-acre scheme in North Shawbost started with about eighteen crofters and non-crofters participating; there were 37 cattle altogether. Now only four have cattle; the rest have sheep. The sheep-keepers say,

178 "The cattle give too much trouble." A smaller scheme
311 is grazed only by sheep. On the schemes where mixed
232 grazing is practiced, a number of conflicts arise between
233 those who have only sheep, and those who have cattle as
[578] well. To accommodate different demands, one township scheme was divided with a fence; cattle were put in for a month in one part, and then shifted to the second part. The sheep were then brought into the first half. All stock had to be removed from the scheme a month before the lambs were weaned, so that all worm eggs and other harmful elements in the dung of animals previously present would have time to die. What was once used for a single purpose by everyone now has to be divided.

[435] "I paid one pound a head to put cattle on the
[578] reseeding," says a man named Iain. "Now I have to move them off already. Those sheep people want it for themselves. I won't use it if they're going to be like that. Next year I'll have the use of two crofts and my
[409] apportionment. And now that I have my own tractor I
[242] can put a load of sand at the bottom of the croft to make the grazing better."

311 According to another person, who also keeps cattle
233 on the reseeding, "Some people want to move their live-
232 stock on and off the schemes when it suits them, like Iain,

ticism is fundamental to the peoples' lives. A brief 785
ussion of the Sabbath will serve to conclude my discussion [796]
eligion and to indicate some additional difficulties which [128]
Sgiathanach faces in his attempt to preserve his culture.

Sunday does not exist on Skye. There is the "Continental 796
ay" and the Sabbath. On any other day of the week, the [576]
ting is, "It's a fine day," or, more often, "It's a wet
" The Sabbath, however, is "no day to be speaking of [576]
." Keeping the Sabbath is almost a fetish among the
le. It is a readily observable test of an individual's
gious capacity. All unnecessary work, all unnecessary
s, and all unnecessary thought is taboo. Only the
st minimum of worldly activities are permissible. This
not mean a day spent in idleness; the time should be
t in public worship at the kirk, private spiritual con-
lation and family worship. The Skyeman's estimation of [183]
wcomer may depend on his keeping the Sabbath. One man
very surprised to learn how long a memory the people have
a man deviates from the expected. A visitor asked a
ter what kind of a man a certain newcomer to Kilmuir
to which the crofter replied, "He's all right, except
years ago he played the pipes on the Sabbath." Most
omers, including the few Catholics, respect the Sabbath.

No crofter would ever think of doing any work on this [461]
beyond feeding his cattle as an act of mercy. After [231]
s of rain, the crop of oats or hay may be ready for 796
esting on the Sabbath, but he will not touch it. A man 241

e who do not do their full share.

The year for the part-time crofter begins with the prepa- on of his fields. As a general rule both the man who spends winter working for the British Railways or away at sea, and one who finds summer employment near home is found on his t during this period. Following the example of the large ter some use a tractor while others continue to plough by e. More and more are tending to take advantage of the con- ting service of the Department of Agriculture and hire a tor and driver. Once the crops are in, the majority are until the lambing season. Conservative in his belief too much handling of the sheep is harmful or individually d with the almost prohibitive task of singling a small k out of several hundred sheep, he tends to omit the March ing. During the lambing season, the several crofters of township either take turns on the hill or hire a shepherd. first chore, then, which brings them together as a group he marking of the lambs and the first dipping of the sheep out lambs. The July shearing and the statutory dips in st and November are cooperative ventures shared by all ters no matter what size croft they occupy.

In sundry ways, economic interests, judged in terms of ercial efficiency, play a smaller part in determining the omic cycle of the part-time crofter than in the case of the -time crofter. The part-time crofter does not think it h while to ship his few head of stock to the mainland ion markets. He sells them locally at the tri-annual sales.

worth while to cultivate any of the arable, so I use it for grazing." A case which aptly illustrates the influence of the township system as an agent of conservatism is the breeding of pigs. Although several old crofters told me how many people during the times of the "Clearances" kept a pig, they are rarely found anywhere in the Highlands today. The Biblical injunction against the flesh of swine has been taken literally. The older people simply have a strong aversion to handling pigs. One man, a very successful cattle and sheep breeder, put it this way: "Pigs are filthy brutes. I just don't want to touch them -- I never have kept any and never will." At the same time, there are men who believe that the prices these animals bring at the mainland markets more than compensate for the individual's revulsion, especially as long as the Ministry of Food pays for the cost of transportation. These men cannot try branching out because they have no way to restrict the foraging animals. "Skye is ideal for pigs," one young fellow told me, "but I don't have the freedom to work the croft to suit myself."

Smaller deviations from the traditional methods of land use face the same difficulties. A progressive crofter who attempts to improve the value of his stock by growing scientific mixtures of grasses is always penalized. As soon as the harvest is over, the stock of all his neighbors will show their appreciation by concentrating on his croft, trampling his fields, and overgrazing his grass. Nor is this his only penalty. His neighbors will regard him with skepticism for his departure from the ways handed down from the past.

621 632 626 232 178 from the ways handed down from the past. We might note at this time that even the progressive crofter is not always quite en rapport with modern techniques. There was, for example, a man with two calves infested with liver fluke. Convinced that medicine was the only solution, and equally convinced that a person cannot believe everything he reads, he obtained a bottle of liver fluke medicine which was plainly marked: "for sheep only." When asked how his calves responded to the treatment, he responded, "Och, they both died."

632 621 626 178 Because of the restrictions which the township system imposes, there has been a growing, perceptible rumble of agitation for supplanting unanimous consent with majority rule. Few, however, would go as far as a retired seaman who returned to Skye after forty years. He would like to see the township system abolished. Another small group believe the Sgiathanach would be better off if the Island were given over to communal farms. Most seem to favor the continuation of the present system. Of course, the majority is composed of the conservative old men.

The Aged and the Absentee Crofter

241 427 887 888 311 No appraisal of the crofting system is complete without a discussion of two additional factors which have affected the use of the land and the present unsatisfactory economic condition of the Island. One of the factors is the aged tenant, who, as we have just seen, exercises a strong control over the younger men through township government. He has also influenced

233

233 PASTORAL ACTIVITIES--large-scale herding of grazing animals (e.g., cattle, sheep, reindeer); ranges; driving and watering; branding; roundups; special equipment; specialized personnel and organization; etc. See also:

Nomadism . . . . . 221 Fences and corrals 417

For example, a Widow Catherine lost "one red
175 mare and foal (L10), one dun cow (L3/10), and one dun
427 heifer (L1/10)." One family is said to have paid rent
[435] by being fiddlers for "the castle" (the home of Sir
[551] James Matheson), thus earning the patronymic, "Fiddler."
Their income stopped suddenly when the fiddler at the
time, a great-grandfather of descendants now living,
converted to the Free Church and smashed his instrument.

In 1899 and in 1905 it was noted in the rent ledger
that two crofters wanted "first chance of a vacant croft
in the township." In the first quarter of the century,
[628] a conflict ensued between Shawbost and a neighboring
[764] township over the extension of a cemetery; land was too
precious to take out of cultivation and give to the dead
of another village.

173 A 65-year-old man recalls, "Men got their living
241 from the land and sea. They kept more cattle when I was
• [233] young. They used the dung of the cattle to fertilize the
[237] soil. The entire croft was used. My father's croft was
only 2½ acres, but he worked it well and harvested eight
stacks of barley to see us through the year." There were
173 a number of kilns to dry grain, and mills along the streams
243 to grind the barley. The "old Norse mill" which was
256 recently rebuilt by the school children as a school project
[251] was in operation from 1920-1934. "Then the tweeds got
[897]

581 "The most
584 important thing about courting was the land. If a girl
423 was going to get a croft, she could have the pick of
anyone." Stories are told of broken alliances and the
interference of parents, all related to the inheritance
of the croft. For example, the father of a 70-year-old
woman living today deserted the beautiful girl to whom
he was engaged to marry a girl with a croft. "Never
mind beauty, just a bit of land." A man would hike
fourteen miles across the moor into town to bring back the
jug of beer required for the reiteach (the dinner party
announcing an intended marriage), only to find that the
girl was having a reiteach with someone else.

• 233 Cattle were much more important than sheep in the
early economic history of the Highlands. Scottish history
is full of stories of cattle thieves, and of "the drove,"
in which large herds were driven to Lowland markets. The
[789] most common examples of witchcraft concerned spells cast
on cows. Many Lewismen still remember market days on
Lewis, the day of the drove when cattle were herded into
Stornoway from all parts of the island; when children
were taken from school to help with the drive, and shop-
keepers put up extra stalls for the occasion.

Until as recently as ten years ago, a form of
transhumance was practiced on Lewis whereby the cattle

• 233 were taken out to small huts in the central moorlands
233 for several months during the summer. These moorland
342 dwellings, called sheilings or airidh, were tiny stone
structures, as small as seven by five feet. They had
double stone walls filled with clay, and a rounded
thatched roof. There were two doors opposite each other
in the longer walls, one of which was filled with turf
depending on the direction of the wind. A fireplace
[354] was built into one end of the hut; shelves in the stone
[352] walls held basins of milk and other items; and the major
part of the sheiling constituted a grass-and-heather-lined
cavity which served as a bed. The sheilings were usually
[361] clustered together near a stream, duplicating neighbor-
hoods within the village.

221 Ploughing and planting were finished in the spring
before the young men and women went off to the fishing,
and before the cattle were taken to the sheiling. Some
families went to the sheiling as early as March for a
"fresh bite" of grass. Many went out in the middle of
May, and returned at the end of July or beginning of
August.

233 "During the week, young girls or boys stayed out on
857 the sheilings, depending on who was available in the
887 family; maybe old people who couldn't do anything else,
462

233 usually an old woman, as the women were responsible for
857 the milking, and the old men were usually fishing around
887
462 the village.

233 "We left for the sheiling early in the morning,
512 taking bed clothes and food. I walked out with my aunt,
who went back home in the morning. My mother came out
with the provisions in the evening. If no one came out
[513] that day, I went to sleep with someone else. You never
slept alone. During the day we fished for trout or
gathered small blackberries; or we looked for the nests
of grouse and other birds. You would knit or read, and
walk for miles to visit friends. The boys swam in the
loch, and sometimes the girls pinched their clothes.
From the top of the hills you could see Stornoway, the
hills of Lochs, Uig and the lighthouse in Ness; on some
days you could see the distant hills of Caithness on the
mainland. It's on the sheiling that I learned about
other parts of the island.

"I remember watching the sun and trying to will it
512 to stay high in the sky, before our mothers came out from
233
234 the village to milk in the evening. They called the
cattle--'Troit, troit, troit'--and they carried the milk
every day from the sheiling to the village, all those
miles. The cattle knew their own sheilings; sometimes

512 The cattle
knew their own sheilings; sometimes
233 they came back before milking time and stuck their heads
825
[234] inside. They stood outside the sheiling at night, and
that's how you can tell where a sheiling once was, even
though the walls have fallen, by the rich green grass.
Calves were born during the summer. A hollow was scooped
233 out in the peat, and lined with turf and moss. People
[422] had as many as four or five cows. It was like Switzerland,
only we didn't have the bells on the cows. There was lots
[272]
[262] of milk, fresh thick cream and crowdie (clotted sour
[234] milk); the old people knew how to make cheese.

233 "The moor was very eerie at night, with the sound of
821 the birds. There were only a few hours of darkness
751
[513] anyway, and I'm sure we didn't get much sleep, but somehow
we were always fresh. It was the air, the moor air is
more health-giving. The air is different there. Ill
people benefited from the change. Sometimes a person
with TB would stay out there all summer. The air is heavy
by the sea.

805 "There was no sense of time the way there is today.
233 If you got lost in the snow or fog, you followed the cows
221 home. You had all summer to take home the peats, to work
829 the croft, to harvest the corn. There wasn't a world,
[178] there was only ourselves. That has changed since the war.

233 "You got away from village life when you went to
829 the sheiling. The youngsters ran wild. Everyone talk
more freely somehow. It didn't feel like a Sunday out
233 there--the minister couldn't see that far. Only the
883 young men and women in their late teens or 20's were o
at the weekends. They would send the younger ones hom
They came out in their good clothes, from Saturday nig
to Monday morning. Groups of young people walked out
back together, the girls in one group and the boys in
[533] another, joking and teasing. They sang the old songs
learned new ones from each other. Some were good at
making up songs. You wouldn't believe how many people
could sleep together in a single sheiling. It was a
[829] heaven on earth. Everybody was one family. The hills
were filled with the sound of voices."

233 Not every family in the village went to the sheil
Some families had enough land within the township to g
their cattle. But they usually went out at the weekend
for the fun and company.

237 One of the most important products of the cow was
241 not milk but dung, which was used to keep the poor lan
productive. Because people did not have the enriched
231 animal feeds available today, a cow might not have a c
234 and thus did not give milk, for four or five years.

typical homestead or "farmtoun" consisted of a "ploughgate" occupied by eight tenants, each of whom contributed one animal to the common plough and thus had an eighth of a share of land or one "oxgate" (Grant 1930: 97).

In the Highlands and particularly in Lewis, about four to six men and their families worked together and shared land which was held in run-rig. The Old Statistical Account (1796) lists 90 ploughs in the parish of Barvas or about one plough per five families (Geddes 1948: 57). Geddes maintains that joint tenants paid an equal share of the rent and had equal "soumings" (the number of stock allowed on the common grazing land). In contrast, Walker (1812: 56) says that joint tenants paid different rents according to the share which they had in the arable land, and that the number of cattle which a tenant had on the common grazing land was soumed or proportioned to his rent; all the tenants worked the arable land together, and received a percentage of the produce which was appropriate to their share. Geddes' description (1948) emphasizes equality within the joint farm; Walker (1812) and Gray (1952) point to differences between tenants and subtenants.

175 632 241 In any case, the "town" or township was not the effective work unit, but rather was the larger neighborhood in which several joint farms existed. [233] The tenants of several joint farms grazed their stock on the surrounding moorland (i.e., on common grazing land).

D. From Run-rig to Crofting

175 233 241 311 Run-rig was an agricultural system suited to a pastoral people, who required the use of open, common pasture for grazing their livestock; the arable land was limited, and of varying quality (according to Day (1918: 12), 54% of the land in crofting counties was mountain and heath used for grazing, and only 5% was [423] arable land). Residents worked several strips of different quality, and the strips (in drained beds of earth a few feet wide and many feet long called lazy-beds or fiannagan) were usually re-allocated every few [625] years. A "constable" acting for the landlord ensured that proper husbandry was maintained.

175 241 178 427 The joint farm, and the stratification of tenants and subtenants within the farm, disappeared as "progressive" landlords began, in the second half of the 18th century, to substitute compact holdings for the "mingle-mangle of dispersed strips (Gray 1952: 46)" 000 which characterized run-rig. Hamlets or clachans

178 311 232 233 land is reduced if his application is granted. Also, a group of men in a township may apply to the Crofters Commission for permission to fence off a portion of the common grazing land and improve it as grazing for their mutual use. Grants are available for both schemes. The township reseeding schemes, adopted widely after their introduction, have been superseded by the number of individual apportionments.

The first township reseeding schemes in Lewis were tried as an experiment in Ness, Harris, Barvas and Bragar. "The Department of Agriculture fellow [664] watched us every step because it was an experiment. Oh, there were times we cursed him and wanted him away." In Shawbost, a few interested crofters went around the village to see if others were interested. "We got a bad name for it; no one could see anything to it. But those people got the benefit of it." According to one man, initial reluctance to participate in the schemes was overcome when the agricultural advisor pointed out that if they overstated their costs, they would not have to pay much money themselves.

Between 1959 and 1962, seven township reseeding schemes were developed in North and New Shawbost, and four in South Shawbost. They were intended to give

178 311 232 233 extra grazing for cattle, but by that time the cattle were already on the wane.

"The original idea was to provide an early bite for the cattle, because everyone had cattle then. Otherwise they would need to buy more baled hay to see them through the winter."

"Almost everyone in New Shawbost had a share in the 1959 schemes, about 26 altogether. Then it was mostly cattle. We took turns bringing them in at night, and I remember taking 33 home, with some left behind for the night. The cattle were grazed over the summer, and the [221] lambs were put on from August 10 to October 10. Many dropped out after the first four or five years, when they stopped keeping so many cattle. When the number dropped to 13 or 14, they started using the schemes for mixed grazing, and then some took up their shares again. When we only had the cattle and lambs, we didn't need a souming; but when the mixed grazing started, we had to keep down the number of sheep. Last year we had difficult with disease."

A forty-acre scheme in North Shawbost started with about eighteen crofters and non-crofters participating; there were 37 cattle altogether. Now only four have cattle; the rest have sheep. The sheep-keepers say,

178 311 232 233 578 "The cattle give too much trouble." A smaller scheme is grazed only by sheep. On the schemes where mixed grazing is practiced, a number of conflicts arise between those who have only sheep, and those who have cattle as well. To accommodate different demands, one township scheme was divided with a fence; cattle were put in for a month in one part, and then shifted to the second part. The sheep were then brought into the first half. All stock had to be removed from the scheme a month before the lambs were weaned, so that all worm eggs and other harmful elements in the dung of animals previously present would have time to die. What was once used for a single purpose by everyone now has to be divided.

435 578 "I paid one pound a head to put cattle on the reseeding," says a man named Iain. "Now I have to move them off already. Those sheep people want it for themselves. I won't use it if they're going to be like that. Next year I'll have the use of two crofts and my apportionment. And now that I have my own tractor I can put a load of sand at the bottom of the croft to make the grazing better."

409 242 According to another person, who also keeps cattle on the reseeding, "Some people want to move their livestock on and off the schemes when it suits them, like Iain,

311 233 232 829

311 who wanted to keep his bullock on the reseeding
233 another week because he wasn't ready to sell it;
232 he should have known the rules. Some people wan
829 keep both cattle and sheep on at the same time,
although the agricultural advisor says cattle sh
go on first, because sheep go for shorter grass.
Other people want to put on twice as many sheep
those who have both cattle and sheep. When they
keeping cattle, they think they're not getting a
share of the reseedings.

"The Crofters Commission wanted communal to
schemes. But people have different demands. It
better to go for an apportionment. You can do w
want with your own land."

178 311 232 423 476 The number of township members participatin
the communal schemes is diminishing to the point
it is less expensive, and much less subject to c
arising over differences in stock-keeping, to in
individual holdings of land rather than try to s
communal practices.

178 241 476 of the normal capitalist farmer in the West; but in crofting areas, these practices reveal a strain between communal and individual tendencies.

a. Fencing:

233 (178) (417) (333) Although run-rig was replaced by fixed, compact holdings, the method of animal husbandry was not affected until the land began to be fenced. A single dry-stone dike enclosed the township, keeping livestock on the moor and away from the arable land. In different parts (184) of the Hebrides, various types of herdsmen were hired to protect both the livestock and the growing crops (cf. Owen 1958-59 for a discussion of cattle, calf and sheep herdsmen in North Uist).

175 625 The township Constable had a great deal of power, which included the right to evict people from their crofts, to enforce rules of good husbandry. The last Constable of Shawbost, who died at the turn of the century, has been credited with a number of ignoble actions, such as forcing an old woman with a sore leg to take her cow to the moor along with all the others. Old widows who had no one going to the fishing and hence no means of paying their rent might be evicted in favor of other persuasive, land-hungry members of the village.

[221] sheep were allowed past the township dike, to graze along with the other livestock on the stubble of corn and barley, and mineral-rich seaweed by the shore.

175 178 311 417 233 After World War II, the individual crofts began to be fenced, and the township dike was no longer repaired. The fact that sheep were still grazed communally on the moor meant that everyone had to go out together on a particular day rather than individually, but fencing of individual land facilitated variability in land use. Less use was made of crofts for raising crops, and they could be used for grazing sheep all year round.

b. Reseeding schemes and apportionments:

178 311 Another illustration of the individuation of land
[241] use is provided by comparing the number of apportionments granted by the Crofters Commission for Lewis in the last 10 years with the number of township reseeding schemes carried out during the same time (see Table IV).[1] A
[425] crofter may apply to the Commission for an area of land (apportionment) to be sliced out of the township's common grazing land and given to him for his own use; theoretically, his share in the township's common grazing land is reduced if his application is granted.

(B) VEGETATION

1. *The Vegetation-types and Pastures of the Highlands and Isles*

137 311 In order to see the Island problem in true proportion, the types of vegetation and rough pasture in the Highlands and Isles should be outlined. Dr. Hardy's reconnaissance botanical survey of the Highlands, with its coloured map, has been utilised in the compilation of *A Reconnaissance Map of Vegetation of Scotland.*[1] The latter has been boldly simplified in Fig. 7.

The Highland pastures are of two main regional types, eastern and western, with the addition of a few great stretches of peat moor. East of a line from Stirling to Inverness, heather is dominant, as it is on the heights around the Dornoch Firth, from north of the Cromarty Firth and Ben Wyvis to the border of Caithness. To the west of this, heather, though still found, is mixed with [233] grass and sedges. The grazings of the North-west Coast have been the adopted home of Cheviot sheep for over a century, for Cheviots are grass-feeders which cannot thrive on heather-tips. True, acid 'Dry Grass Moors' lie inland from the Beauly Firth and Dingwall. On the rest of the West Coast from Gairloch and Loch Torridon south to Kintyre, 'Marshy Grass Moors' with but little pure [233] heather clothe the lower slopes. These give way on higher slopes to 'Mountain Pastures', reaching up to about 2500

face sheep. Wherever in the west the slopes drop fairly steeply, good pasture grass with some heather may grow, or rather did grow until bracken overwhelmed them.

241 288 183 233 The competition between the loom and the croft is evident in the few communal township practices which still exist. One of the rules of township organization is that all households must bring their sheep in from the moor on the same day. Other rules are that no one [231] should go out on the moor at any other time with a dog, and everyone who has sheep should go out on the day designated by the township grazings committee to collect them. The moor is extensive, and the sheep wander over a wide area. Only if a large number of men go out together and come in with their dogs like a wide net can the sheep be brought in with a minimum of effort over the stream-cut, uneven ground. Anyone who goes out alone disturbs the grazing animals and probably drives them farther away from the village.

233 183 These rules have strong ethical import and are much more than a set of procedural rules prescribed by the Crofters Commission. "There is a code of ethics which you learn as you grow up, as you go with your [578] elders out to the moor. You can fight with a man over a woman and make it up next week; but if you fight with a man over a sheep, you won't make it up for thirty [178] years." That these rules are weakening in importance is indicated by situations in which only two or three men have gone out in the early morning to bring in the

233 183 178 sheep. These men arrive back in the village hours later to find the road lined with the cars of men who have come to look for their own sheep among the flock but who had not bothered to spend the time collecting them. Many have gotten rid of their sheep to "concentrate on the weaving."

233 178 578 2. Sheep vs. Cattle: As mentioned in the section entitled "Changing Land Use" (cf. Chapter 2), a split has emerged between those who keep cattle, and those who keep only sheep. Cattle were once predominant, but the number of sheep has greatly increased. The conflict between raisers of sheep and of cattle extends beyond the use of the reseeding schemes (see Chapter 2).

Cattle are usually brought in from the reseedings or from the common grazing lands where they are tethered, and put on the unfenced, arable inner grazing land of the township at the same time that the sheep are brought in from the moor. In one township on the west side of Lewis, the cattle were released a few days before the fank,[1] which resulted in the formation of two groups, sheep-only people and sheep-and-cattle people, which opposed each other. At the fank held a few days later,

[1]The word "fank" refers to the process of bringing the sheep in from the moor, and to the wooden pen in which the sheep are gathered and claimed by their owners.

233 178 578 sheep were let out of the pens, and a fight broke out between the two groups of people.

241 657 578 175 [671] 3. Crofters vs. Non-crofters: Another division within the township has developed largely because of the attention paid by outside agencies to "crofting." The Crofters Act of 1886 defined crofters and gave them a protected, privileged status. In fact, very little distinction existed between non-crofters (sometimes called squatters and/or cottars) and crofters, and in some places such as the Isle of Scalpay, non-crofters even out-numbered crofters. Both categories were linked to each other by bonds of kinship and mutual dependence. Non-crofters were in fact favored economically. They did not have to pay rent, but had the same opportunities to graze stock and plough land as did crofters. Many crofters themselves 241 175 423 had buaile, units of land not recognized as part of the croft and not included in the land for which rent was paid but recognized as property by the villagers themselves to the extent that these bits of moorland passed down through families or could be given by one person to another. Even today, a young girl thinking of getting married says her future husband might build their house on her father's buaile, and a man may build a house on moorland "given" to him by his wife's aunt. Officially, a non-crofter had no "rights" to a house which he built on the common

241 The Department of Agriculture dispenses subsidies to
654 all Scottish farmers, not just to crofters, and handles
[433] about 210,000 claims per year. Lewis produces 0.4%
of the agricultural output of Scotland, and 8.1% of the
agricultural output of the Scottish islands.

654 The major subsidies available to Scottish farmers,
• 233 including crofters, are for raising hill cattle, beef
calves, and hill and upland sheep. Sheep and cattle
subsidies were made available in 1941, in the early years
of the war, to increase their production. During wartime,
Britain was more dependent than formerly on her own
resources, and attempted to encourage production. Between
[458] the two world wars, agriculture had undergone a recession,
especially in the hills and uplands, because of a number
of events in world economics, such as competition from
New Zealand and Argentina in production of cattle. As
part of the scheme of the postwar Labor government,
agricultural support was made statutory.

For example, a man who keeps hill cattle may receive
L18.70 per cow as well as L5 for each acre cultivated to
feed his cattle during the winter. He receives L5 for
each cow which is tested for brucellosis. In the 1970-71
agricultural year, Shawbost received over L2,000 in sheep
and cattle subsidies, divided among 37 men receiving
subsidies for cattle and 36 men receiving subsidies for
sheep.

• 233 One crofter who gets subsidies says that he keeps
241 sheep and ploughs the land to feed them only as a "hobby."
654 He uses the word "hobby" because, in comparison with the
523 income he gets from working regularly in the mill, he
434 does not get a good return for his investment.

233 A crofter who has been weaving all his life says
288 that the income he receives from his cattle and sheep
434 does not compare with the income he receives from weaving.
654 Subsidies are counted as an important part of the income
he receives for the livestock. "Last year I got L28 for
a heifer--not a very good price, but then I got an L11
subsidy as well." He does not believe that anyone could
829 make a living from crofting alone. "You say some of the
434 people in Uist are able to make a living at it? They
241 might be getting social security as well, they're that
sly. Anyway, members of the family are probably sending
money home from sea or from the mainland. You need a
weekly wage. If the tweeds disappear, the only thing a
man could do would be to go to sea." (See Appendix C
for an example of the balance sheet of a croft.)

233 A few families work seriously at rearing cattle for
463 sale in local or town markets. These are usually
composed of several male adults, of which one or more
work in the mill or do weaving and someone is largely
○○○ responsible for croft work. Most of these people look

• 233 Most of these people look
829 askance at the idea of Britain joining the European
648 Economic Community. "If the Common Market comes, that
654 means no more subsidy for livestock. That'll mean the
end of crofting. They'll get good prices for their
beef, but feeding stuff will be very expensive."

"I don't know much about the Common Market, but
I'm against it. They'll do away with the subsidies.
If it weren't for the subsidies, most people just
wouldn't bother with cattle and sheep; it wouldn't be
worth their while, the feeding stuff is getting so
[246] expensive. The people here used to take in a hundred
bags or so of potatoes to feed the stock. But the climat
is so bad you don't know what kind of a return you're
going to get, and the work is so hard it just isn't worth
the bother, so people prefer to buy feeding stuff. And
if you spend more on feeding your animals than you get
for them, what's the use? Of course we've been here
all our lives. It would be hard to leave. But if the
weaving goes--"

"I was talking to my cousin in Glasgow. He says
the cattle are going to be the big thing with the Common
Market. The price of beef is going to go up. I don't
think people here can keep cattle if they don't get the
subsidy. They can't keep enough cattle, and they can't
be sure of a good price every year."

178 231 234 233 The number of cattle diminished as milk became available by other means; and when the township reseeding schemes came into existence, the need to go to the sheilings for an "early bite" was removed. The sheilings 178 342 that remain in use today are huts of tin, wood and concrete within easy walking distance from the highway, used on weekends and during summer holidays. Most of these modern sheilings are close to Stornoway, and serve as summer retreats for the relatively harried urban [184] dwellers such as publicans. On the west side, the sheilings are no longer used, but remain as a theme of songs and in nostalgic memories.

C. The Loom

175 286 Clo Mor, the big cloth, was woven in the Highlands and Islands for hundreds of years. Martin Martin, who travelled through the Outer Hebrides in the late 17th century, describes the export of "plaiding," and the practice of waulking or shrinking the woven length of cloth (Martin 1716). Weaving was done on wooden looms, and produced only for local markets until the middle of the 19th century.

[731] By the middle of the 19th century, the failure of [735] the kelp industry, decline of fishing, and destruction

592 24 31 288

like to leave the loom for the time it took to look after the sheep."

592 23 24 [233] [246] [288] [463]

A fourth household consists of three unmarried siblings in their 40's and 50's who recently sold their cattle and now keep only sheep for their own consumption. They cultivate a small amount of oats and hay to feed the sheep during the winter. The brother who was largely responsible for taking care of the livestock is now "concentrating on the loom," and his brother works in the mill. Their sister, who used to work in hotels on the mainland, now keeps house for them. Described as a "self-contained family," they have a tractor and a deep-freeze and take care of their peat and the harvesting of crops by themselves. One of their crofts has become too waterlogged even for grazing and was sold recently to the son of a local crofter, not for agriculture but as a prerequisite for applying to the Department of Agriculture for a housing grant. Only tenants of crofts can apply for such grants. As this particular croft is too wet to be cultivated or used as a house site, the only motive which the new tenant has to become a crofter is to gain access to governmental subsidy.

[402] [404]

654 423

592 233 311

The fifth household is composed of a retired couple and their son and his wife and family. They have no cattle, and use the crofts for grazing sheep.

*159 The third sister worked in domestic service in Glasgow all her life and never married.

Calum Ban had joined the Naval Reserve before the war. "There was always a sign up in the Stornoway Labor Exchange for men to join the Naval Reserve, because the islanders were such good seamen. They were fishermen or had been in the Merchant Service." Calum was in the navy for five years during the war, and became "skunnered" of *159 (tired of) the sea. He is very interested in sheep, and • 233 knows their major earmarks or brands between here and Ness. 422 "The earmarks identify tribes of people. The Macleods have a particular mark, like a slice at the base of the right ear; the other marks were added as the families divided and subdivided so that the relationship between them was lost. Even though you can't calculate the relationship, you know you were once part of the Macleods that put that original mark on; you can see it all in the ear marks."

*159 Calum also raises bullocks, without keeping a cow. 233 He buys young bulls at cattle sales, and sells them after two or three years. But recently his back has given him a lot of trouble, and he has had to limit his crofting activities.

*159 Seonag and Calum Ban have four children. The eldest is in the Merchant Service, and the second son is a teacher. A daughter is studying domestic science in

Appendix C

Balance Sheet of a Croft

*159 "The Muillear" has one croft and a two-acre buaile. 241 In 1970 he planted one-eighth of an acre with three bags 244 of potatoes, two of which he bought for L14/16, and 433 (435) harvested 22 hundredweights. This was sufficient for his family's needs and provided some feed for his livestock for all but two months of the year. A small plot is planted with cabbages, for domestic consumption.

(311) Seven-eighths of an acre is planted with oats; one- (246) and-a-half acres with grass and hay; and two acres • (233) are used for rough grazing.

*159 The Muillear is interested in new ideas and techniques. 232 He goes to meetings and discussion groups sponsored by the 233 North of Scotland College of Agriculture, and has bought prize rams from the mainland to improve his flock. He tries to raise a few sheep using techniques of good husbandry rather than a large flock which would be given less effective care. He is teased by other crofters for "overfeeding," and for keeping his sheep on the croft and the township reseeding rather than out on the moor. "His sheep get homesick when they get out of sight of the croft." He wins the prizes at the Carloway Cattle Show each year, in a

ly triumphant yet unassuming way. He does not kill
f his sheep for home consumption.

His involvement with the croft is a "hobby" because
utput does not compare with the income he receives
weaving. Whereas he might make as much as L100 from
rofting activities, his income from weaving averages
) a year. As a married man, he can earn as much as
vithout paying income tax.

241 documented; and Harris and Lewis played out their part in the
614 agitation for more land. Briefly, when the clan system was broken
182 down, the clansman found himself freed of the obligation of ser-
311 vice to the chief. The chief, on his side, found himself thrown to
*175 the economic dogs. Payments in kind were no currency; a house in London or in Edinburgh had to be paid for in cash, and a London hairdresser would hardly accept half a dozen eggs for his services. The effect of the Heritable Jurisdictions Act was like a butcher's chopper. With a stroke a social organisation was given notice to change overnight, with no period of transition allowed. The chiefs looked to the land for their money. In the old system, their prosperity had been largely measured in fighting men. Now the pressures of economics demanded increased rents from those who were being called tenants. Increased rents can, however, be paid only when the land's productivity rises. The agricultural changes percolating through the Lowlands of Scotland had not
[427] even begun to penetrate to the Highlands area. Many tenants found that, unable to pay the increased rent demands, they were ejected from the lands which, incidentally, they had held by traditional understanding—written deeds were rare. Emigration
[167] started, and the vacant lands went to sheep-farmers, well able
• [233] to pay good money for the grazings.

Some chiefs did give their tenants time to change to new
241 methods of land use, and were careful not to make a breach be-
614 tween agriculture and grazing. Their tenants in turn improved
311 the land, changing in particular from the old run-rig system,
427 whereby a man working a piece of ground one year had the same
*175 piece the following year only if the dice were thrown his way. But the class of farmers' tenants called crofters (who had no security of tenure) or cottars (a squatter type with no legal recognition) found themselves on the verge of starvation. The few acres of ground they had, or to which they had been removed, were quite unsuitable for intensive cultivation to produce even the basic necessities of life.

*175 The picture of land use was that of a great black pot boiling
423 furiously with a brew of which the final taste was quite uncertain.
311 When the boiling was controlled, the land began to be parcelled
241 out, a share to each family. This led to a rigid, almost monolithic,

[TEXT CONTINUED ON PAGE 55]

THE CROFTER

241 The pursuit of agricultural processes, their growth, development and improvement, to establish a foundation for a secure society has never been easy on the island. The unyielding nature of the
[135] base rock, Archaean gneiss, its hardness, its non-porous property, have all contributed to the resultant pattern and character of society which emerged. Though one is tempted to define crofting as an agricultural activity, it is also something much more intan-
[113] gible: a way of life. To quote the Napier Report on *The condition of the crofters and cottars in the Highlands and Islands of Scot-*
[81] *land* (1884): 'Habit and local affection bear so great a sway in the actions of mankind, that Highlanders will be found who would rather be proprietors in the mountains of Skye, or the wastes of Lewis, than on the fertile plains of Manitoba.' 'There is the Island of Lewis, with poor, peaty soil covering the Archaean gneiss, but with a crowded, lively, vivid community,' said the Taylor commision in 1955 (Commission of Inquiry into Crofting Holdings).

The Highland crofter is the subject of an extensive literature.
[657] A special authority, the Crofters Commission, exists solely for the purpose of caring for his needs. He has special rights and privileges which are safeguarded by the Land Court. Crofters' unions have formed themselves into a strong federated wall for the system's defence.

241 Socially, the term 'crofter' means, on the island at any rate, a
423 landholder who cultivates his own (arable) holding, his croft. He shares the common pastures with his fellow-crofters, each of whom
• 233 has a right to carry a sum of so much stock, the 'souming'. These
[571] common pastures or grazings are a social link of some consider-
632 able significance, forming the basis for the crofting township, as
[621] distinct from the communities set up under the influence of some agricultural land use such as hamlet or village, where there are both small-holders and true farms, and the only communal land is the village green or common. For instance, outside the crofting counties area the main unit of Scots life in the country is the farm, with its tied cottages. Then come the full-time small-holdings important in the north-east and the southern Highlands.

233 654 As these quotations bring out, the subsidy enables people to risk rearing cattle under conditions that would otherwise make success very uncertain.

476 571 5. Communalism: Despite the decline in various agricultural activities and the individuation of land use, some activities persist which require mutual aid. [484] Conditions of low geographical mobility, in which mutual watchfulness and competitive gamesmanship have developed (see section on "Social Marginality"), contribute to the strong boundedness of the township network. There is still competition over who begins an agricultural [156] [221] activity at a particular time of the year. No one wants to be so early that he stands out like an over-eager novice running risks of frost or other bad weather, but there is an element of pride in being the first to 314 571 476 harvest potatoes or bring in the peat. Almost everyone cuts peat, a time-consuming and back-breaking job made pleasanter with a large labor force; and every aspect of the activity--the time of cutting and bringing in, the length of time required to cut peats, the size of the peats when dry, the type of meal served to the work crew, the evenness of the final peat stack--is subject to intense scrutiny.

costly, that the Common Market will soon drive up milk prices, and that income from the weaving has become too uncertain.

412
178

Many tools and techniques associated with crofting have disappeared: the flail for threshing oats (two pieces of wood joined with leather); the sheepskin stretched over wood with holes burned into it, to separate chaff and grain; rope made of plaited heather and straw.

241
[221]
[237]
[824]
[173]

Each spring the byre was cleaned of its accumulated dung and urine, and this was turned into the ground along with seaweed. Such tools and techniques remain among the older villagers as a "memory culture" which may be mobilized under changed conditions, as when alternatives to crofting are no longer available or are too costly. However, the longer crofting is neglected, the less it will provide an alternative strategy. "The artificial

241

fertilizers are ruining the land; that's why the turnips are full of maggots and the potatoes turn to

[233]

water." As the rushes grow and clog the drains and streams--rushes that used to be eaten by the horses and cattle and which are now left untouched by the sheep--the land becomes unfit even for grazing. "I'd rather work the land than the blinkin' loom, but we tried the potatoes, turnips and cabbage last year, and lost them all to the maggots. You lose heart after that."

PLATE VII. WESTERN NORTH HARRIS FROM THE ISLET OF SCARP

View due east across the Sound of Scarp to the hills of North Harris : the furthest is Tirga Mor (2227 ft.). From the crofter-fishers' homesteads (left foreground) potato patches and hayfields extend towards the hill and wall of common grazing (extreme right foreground)

there is frequently found the most thriving of the vegetation types of Lewis and the best grazing ground. It includes grasses such as those already named, together with purple *Molinea*, meadow soft grass (*Holcus*), and mat grass (*Nardus*); sedges (*Scirpus* and *Carex* spp.); with the field wood rush (*Luzula*) and a fair number of flowering plants. Heather is common in this and the following community (3).

With true 'hill' pastures, found especially to the east of the Forest of Harris and between Loch Seaforth and Loch Shell, are included fair pastures with good grasses on the rocky hillocks near the villages around Loch Roag and also on the low, steep hills northward to Shawbost. The 'skinned land' lies in strips too narrow to be shown on the map, but may form a ring of desolation round the village. The hard moor-pan resists natural seeding of plants unless broken by the pick, but broadcasting of a cheap seed-mixture with a little fertiliser can work marked improvement.

(3) *Marshy Grass Moors.*—Where the slopes are gentle, and the acid humus has accumulated to form peat, is found coarse, tussocky, damp pasture, of sedges and grasses, grading from the 'fair' and 'hill pastures' to the beginnings of hummocky peat hags and smooth sedge moss. It covers the slopes of hills such as Ben Barvas and Muirnag and the hillocks that emerge from the great central trough of brown peat moor. It also characterises the low but broken areas in southern Lewis. This type forms a belt below the 'hill' and 'rocky' pastures of Harris. At its best its prevailing hue is olive-green turning to a silvery shade and then to russet later on. Annuals are few and the grasses are coarse.

(4) *Peat Moors, Mosses and Peat Hags.*—The most

thirds of an area nominally under crops actually grows them. It need hardly be said that such crofts do not support a family.

The means of cultivation have been either pony-drawn ploughs in the smoother north, or else the foot-plough (*cas chrom*), and the straight spade in the hilly south. I saw the almost obsolete foot-plough used on hilly ground near Rodel, Harris, in 1919. In the smoother lands from Stornoway and Barvas northward, however, the crofts then were already laid out in parallel strips, no more than twelve to fifteen feet wide, divided by open drains. Open drains have increasingly been converted into underground drains over which pony and plough can pass. The cattle feed on the rough pasture or on the grass about the crofts, supplemented by hay cut with a sickle from the grassy edges of the 'lazy-beds'. Quite recently, rotation grass has been sown on the arable strips, and mown for hay by the scythe. Tractors were introduced in war-time, in 1942.

In many of the villages, cattle are still taken to the summer pastures out on the moors some miles from the crofts. Those who herd the cattle live in huts or shielings, annually re-roofed. In the congested 'Point district' (the Eye Peninsula), the cattle must go to the moor on the main island or be taken on to their owners' crofts from late May or early June to about the 10th of August, in order to clear the common grazing and allow the grass to recover. This migration takes place, of course, because of the restricted area of common pasture. On the other hand, pasture is plentiful in the parish of Lochs, lying all round some of the villages, and here the use of the shieling has been practically abandoned. In almost all villages, with the exception of those of the Eye Peninsula, there is less summer pasturing than formerly; fewer cattle are sent

away, and for a shorter period. The sheep wander over the moors all the year round, though they hang about the crofts when the winter is severe.

A comparison with mountainous Norway or the Alps and their high summer pastures suggests itself; but in Lewis altitude is almost negligible, and the shielings may lie only two to five hundred feet above that of the crofts beside the shore. The difference between winter and summer is in any case less, snow being rare and the conditions being such that even in summer the shieling pasture remains poor. Hence it is that while modern Norse and Alpine economy still maintain the summer pasture, the shielings have died out in the Highlands and are slowly decaying in Lewis. Seasonally, stock are transported over longer distances, from Highland to Lowland pastures.

Reasons for the continuance of these and other crofting ways, or for their abandonment, are not of an economic order alone: not only the remuneration received for labour, but the feeling for the work counts enormously. Visiting a couple of distant shielings in the summer of 1919, I found that two lads newly home from the Navy had come up from their village 'for a holiday', bringing rods for trout-fishing and high spirits for play. By day they fished or flirted. By night they slept in one of the two shielings, while the two laughing lasses they had come to visit shared the none too wide couch of the other shieling with the two older women there. One of these was a matron with a motherly twinkle in her eye, the other was a spinster in whose eyes there shone a memorably vivid light; she was the sister (as I found later) of a noted minister on the mainland. The bare simplicity of shieling life is traditionally softened by fellowship and a gaiety that is not beyond control. A Lowland poet once coined a famous phrase,

241 struction of a single ring fence round the croft land, which
also circumscribes a good deal of rough grass, the ground
[178] being generally rough in parts. Individual crofts are
fenced only where exceptionally large, or when the pos-
(654) sessor is unusually enterprising or is isolated. Depart-
(634) mental help is given in the provision of fencing materials
for a township, the crofters supplying labour. As the
• 233 animals are allowed to graze freely in winter, this limits
241 crops to those sown and harvested in the summer half-year
—a serious matter for any man of enterprise who cannot
afford a fence of his own. Cattle kept on the croft when
the fields are under crops have to be either tethered or
driven to a common pasture. A drystone dyke may
enclose a small patch of garden, rarely well tended, the
school gardens providing a laudable exception.

233 Shortly before 1939, the stock included under 1000
agricultural horses and well over 10,000 cattle (of which
more than 6500 were milch-cows), but practically no pigs.
Sheep number 42,000 ewes, or 94,000 ewes and followers
in June. Thus there are 2·5 cattle on an average holding,
of which more than 1·5 are milch cows; and there are
233 half a score ewes or about a score of sheep in June. The
178 size and the quality of the cattle have greatly improved
since first I visited the island in 1919; at that time the
mongrel Highland breed must have been the very poorest
in Britain. The Blackface sheep are small, either through
underfeeding or because of traces left from the old, smaller
Hebridean breed, or from both causes. On an average
there is, or was, one horse, or pony, to every five or six
23 crofter holdings, but their number is much reduced.

233 Actually, such Island averages for horses and sheep are
somewhat misleading. In particular, either there are more
(182) horses than the average in a given district, or almost none,

• 233 according to the relief, as explained. Thus the Barvas
182 parish with its smooth topography permits of ploughing,
and there is, or rather was, one horse between two crofts,
231 or one pair between four or five. In rocky Uig or in Lochs,
however, there is only one pony between ten or twelve crofts.
492 Lending or hiring of horses has still to be practised, but
426 within manageable limits, though the increase in 'cars' had
lessened the number of horses, even before the war-time in-
troduction of tractors. Hiring is often done for cash, though
this conflicts with older communal custom. Yet lending
had its difficulties: "The borrowed horse", says the lender
bitterly, in the Gaelic proverb, "is never tired!"

233 The number of sheep per holding is noticeably highest
184 in Harris, with one score ewes per holding. The sheep
pasture of North Harris was well spoken of by Dean
Monro, and the link with the home industry of Harris, its
weaving, is evident.

241 Comparisons with the western mainland show, in
311 holdings of similar or rather large size, the diminished
amount of cereals now grown there even by crofters. The
increased proportion of grass reflects both the greater
dependence on bought provisions, and also the fact that
the West is not a land to ripen crops, but that it can grow
grass for stock.

4. *The Moors as Pasture: Game and Sport*

311 In order to estimate the relative value of the rough
511 grazings of Lewis and Harris, it will be well to compare
these with the moors lying across the Minch and east of
Cape Wrath. There also may be found crofting communi-
ties whose economics are similar to those of Lewis, so
that the stock carried on their pastures will furnish some

311 indication of their worth. As above, the period is *c.* 1937–
511 1938. The Island's increased sheep stock is shown in
Appendix II (ii) (a) to 1953.

• [233] The Lewis and Harris pastures carry on an average
about one ewe to 9 or 10 acres, that is, one ewe or lamb
to 4 acres in June (the month of the agricultural returns).
A good mainland grazing like Glen Shiel carries one ewe
to 6 acres, while poorer grazings like Kintail and Farr
carry one ewe to 10 or 14 acres respectively. Nowhere,
however, can the rough grazing support the newly weaned
ewe lambs (or hoggs) throughout the winter, which have
either to be brought to the enclosed 'low ground' (of
which there is never enough to supply both grass and
winter feed) or sent to the Lowlands in autumn and
brought back in spring, at a total cost of about 10s. each
before 1939. In Lewis, for lack of grass, there is consider-
able loss in winter among the crofters' sheep. Con-
structive measures for the future must be based on an
increased supply of winter feed.

137 The game consist of red deer, grouse and hares, while
511 salmon and trout are fished in stream and loch. The deer
range over Harris, Park and the Uig hills, but are seldom
seen north of Achmore. They are of ordinary quality and
size, and before 1939 the average number of heads for the
year totalled about 190 stags and 80 hinds. It is not known
[529] when they were introduced. In the south there may be
a certain amount of 'deer stealing', as in most deer forests
surrounded by crofts, in spite of a score of keepers and
deer-stalkers, and other employees at shooting lodges.
Grouse are relatively scarce compared with those on drier
[825] mainland moors. Mountain hares have multiplied since
their introduction in 1853, when, it is said, the first hare,
seen near a village towards evening with its white winter
coat, was thought to be supernatural.

137 Inset into the Highlands are three desolate tracts of
134 boggy 'Peat Moor', in Sutherland, Rannoch Moor far to the south, and on the plateaus of Lorne and Mid-Argyll; while marginal to the Highlands are (1) the drier and more dissected plateau peat moors between Lochnagar and Stonehaven, and (2) the intermittent stretches of Lowland peat moss.

137 Finally, intermixed with these are strips of surviving or planted woodland. Below the heather moors of the western Highlands stretch the great pine woods of Atholl, Deeside, and Speyside and the Moray Firth. As the heather thins out, towards the West Coast, pine gives place to oak. Near both are found the graceful silver stems of
[177] the birch, with its small resistant leaves. These woodlands invite the modern forester, who brings in pine, larch and firs in the east and, in the west, notably the Sitka spruce, brought here from the rainy western highlands of British Columbia.

311 The uses to which the pastures are or have long been
233 put, are three: as crofters' grazings—mostly 'commons' (and so indicated on the map), as sheep farms, or as deer
137 forests. (1) On the 'commons' there is close grazing for
[136] both cattle and sheep by crofters near the townships or the holdings, and much peat-cutting. (2) On the hill sheep farms there is more or less regulated burning and some hill draining but almost no cattle pasturing; and as a result of both facts, bracken has invaded the grassier moors.
[136] (3) On the deer forests almost no care is given and the heather, scrub and bracken are coarse and strong. An indication of the margin of the commons, according to whether it 'marches' with farms or with deer forests (given in Fig. 2 by line C), is also shown in Fig. 7 because of its marked effect on vegetation.

Lewis and Harris

133 137

2. *Plant Life in Lewis-and-Harris*

Lewis has been dismissed by many as a floating peat bog, and its name has even been derived from *leodus*, a bog! For good or ill, peat influences the Island, its history, the distribution of its people and the economic and social features of their life. In Lewis, peat once covered everything except the narrow fringes of sandy machar, the surface of the inland waters, jutting rocks and steeper hills where drainage is rapid. Man's encroachment on that carpet has so far been mere nibbling. Except for the machar lands, every acre of ground occupied or cultivated by man has been reclaimed from peat.

133 137 182 [185] [311]

The Map of Vegetation and its Key portray the distribution of the main plant communities (Fig. 8). All plants are of low habit with small leaves, well protected from excessive transpiration. They are mostly perennials or biennials; annuals are comparatively few. There is no burst of flowering save where the heather blooms on better-drained slopes, or where shell sand has blown, enabling clovers, vetches and meadow-sweet to give colour and scent. Moss, sedge and dwarfed heather prevail widely in tussocks.

137

Constant cropping by sheep and cattle, and also deer, tends to keep vegetation low, but on the wide, boggy moors this is a minor factor. Nor is there much systematic heather-burning. Even upon the islets of inland lochs, untouched by grazing animals, and in spite of better drainage due to the undercutting of the waves, growth is not really luxuriant. Bracken, however, is found on the islets, and a little on some former sheep farms, but not on the heavily grazed common pastures, for cattle keep down bracken.

137 233 [311]

[see p. 50 -- analyst]

On the mainland, both Lowland and Highland, an outlying reclaimable patch of arable, lying near distant, little-used pasture, frequently gave a single family the chance of a living. Such a site meant solitary toil for the man and his family; but there might be advantages such as an occasional deer from the forest, or a post as hunting 'forester' such as was held by many a Gaelic hunter-bard. In the Eastern Highlands such a high-lying croft was known as *Ruigh* (anglicised to Ry-). Traditions of poverty with individuality in isolation were handed down, for example, from one of my forebears who held such a *ruigh*, Rycorrach, one of several strung out along the 1250-feet contour in a small, high valley off Strath Spey; the last of them was abandoned only recently. Such a *ruigh* may have originally been a summer shieling, only occupied when shortage of corn-land below, coupled with new possibilities of a little profit from sheep-shearing, led to settlement there.

At the fringe of the Island's deer 'forests' of North Harris and Park, stalkers are still found in lonely lodges and dwellings, individuals often of character and worth, as they need to be; and a few isolated shepherds, such as one finds on mainland sheep farms, dwell on small islets. But in the Isles, isolated, high-lying spots for single crofts are rare. And the clearest distinction must be drawn between the true solitude of a single, isolated cottage or croft and the sociability of a group of four or five, or even two or three, crofts, such as those of lobster fishers; for even a few families form the germ of a community, in work and in leisure.

The potentialities of co-operative practice were overlooked by agricultural reformers, excusably enough. For when new methods were required, run-rig kept back the pace to that of the slowest, virtually arresting reform. Soon

that no initial reclamation had been needed on the scatt. In each year of cultivation, it is true, manures of a sort, principally seaweed and sooty sods from the roof, are applied; but they form a temporary improvement only for the crop to be taken, and do not constitute reclamation. After manuring, the grasses and clovers are simply turned over and the land, 'rested' and manured by cattle, straightway gives its best crop.

It is otherwise with what is won from the moorland. As Dean Monro wrote of the reclaiming Lewisman in 1549: "In this country all is peat moss-land at the sea coast" (the long machars of the west of Uist give place to rocky coasts round much of Lewis), "and the place where he wins his peats this year, there he sows his corn the next year; after that he guids it weill with sea-ware". Even where the slopes are fairly smooth, the peat land has not the uniformity of the machar and the continuity of its arable strips. In addition to sea-ware, sand may be brought by creel or by pony pannier to reclaim peat, forming a heavy burden. Moreover, the first crop is always a poor one, and may be almost lost. Although in his brief notes Monro used the singular 'he', we know that the peat was usually cut co-operatively by teams. Hence most of the hard labour of reclamation may, indeed must, have been done co-operatively too, but by small teams, not by the members of a whole township together.

The sharing of common pastures is the last, but important, feature of land holding in common. The two kinds of pasture required were, firstly, those close at hand, animals being tethered or herded in the crop-growing season, and secondly, the more distant summer pastures. The people of certain townships, which were without a large outrun close at hand, had to go some distance to

reach their shielings. From Point district (Eye Peninsula) the cattle are still brought inland to the moors south-west of Stornoway. And from Bernera on the west the cattle are swum to the hills of the main island, just as they once were swum from Bute to the hill-pastures of Cowal in Argyllshire across the Kyle at the 'Strait of the Swimming', Colintraive (Caol-an-t-snaimh). Nothing could be more natural, indeed inevitable, than pasture in common where large, open moors were to be found. The number of animals allowed to each holding was duly apportioned and then, as now, was known as the summing or 'souming', still checked at the annual gathering (*cosgoradh*).

Thus a cluster of conjoint farms shared "the grass on the Ben and the tillage on the machar" (*Fiar air beinn agus peighinn air machair*). Along the shore, sea-ware, driftwood and the like were allotted, too. And, as Carmichael put it, there was even "run-rig at sea", for the fishing banks were allotted among the available crews. Most of these rights are still shared by the members of a township. But any crew can now fish freely where they choose, and no township can legally keep away strange boats, nor even steamers beyond the three-mile limit. This loss of communal rights stands in the way of remunerative fish-farming and its promise.

Profound social implications distinguished these three concentric circles of community: the family; the farm-team and boat's crew; and the larger, township group. These implications concerned labour, duty and right. The labour of reclamation gave a 'right' to the land thus won from the moor; and the duty of labour together, for fruits equally shared, gave the farm-team and fishing crew cohesion on land or sea—team and crew working for a common purpose. On the other hand, as individual sharers in the common

The care of cattle was accompanied by prayer. As an Eriskay housewife said to me, she would never leave her cow tethered without a murmured, "Saint Columba be herding you" (*Buachaille a'Chaluim-cille ort*). The curing of animal sickness, as of human ailments, was accompanied by prayers. And prayer was used to avert the evil eye, symbol of suspicions born of unreasoning fear which, psychologists tell us, beset the modern but little less than the ancient! The thought or act of prayer which links a man to his fellow-men links him to the dumb beasts. "The man who is merciful to a soul will not be merciless to a brute" (*Am fear a bhitheas trocaireach ri anam, cha bhith e mithrocaireach ri bhruid*).

Throughout Christendom each task of the annual rhythm was marked, at its start and close, by a day of seasonal festival (*Lá Feill*). These Christian festivals replaced earlier celebrations and continued some of their features, often in play. Yet concerted seasonal activities could not be related to the supreme festival of the Christian Church, Easter, owing to its movable date. This is one reason for the great importance of other, fixed Festivals to rural community life. This point, not always appreciated by latter-day individualism, is made clear by M. M. Banks in describing *British Calendar Customs*, vol. i, *Scotland* (1937). Remembering that the Old Style Calendar dates were ten days later than the New Style (when officially adopted in Scotland in 1600), they may be compared with the annual rhythm of climate and labour (Fig. 9). Until 1600, the New Year began in spring on 25th March. After the Reformation and the abolition of Christmas or Noel, *Nollaig*, New Year's Day on 1st January took its place as the day which, in the Protestant Highlands and Lowlands, still keeps alive some of the old friendly visiting and

coat, was thought to be supernatural. The fishing, too, is of good standard: a typical annual catch including 1700 salmon, 5000 sea-trout and 1800 brown trout; and it was for this, as well as for the shootings, that the moors pertaining to the different shooting or fishing lodges and hotels were bought at Lord Leverhulme's sale. The absence of foxes was important to sheep-rearing before the introduction of guns, and is still a favourable factor.

5. *Sea-fishing*

Fish have always contributed to the diet of the Islesfolk, whether they fished from coracles or boats, or with 'lang wands' from the shore as they still do, and as they did in the days of Dean Monro and, no doubt, right back to neolithic times. The relative importance of fishing and agriculture, however, has always varied according to place and time.

Fishing in modern and historic, and also in prehistoric, times—to judge from the kitchen middens of Uig—has always flourished more where there were deep sea-lochs; and settlement resulted, even though rocky hillsides made ploughing difficult or impossible. Conversely, agriculture has offered better opportunity on smooth coasts with a variety of soils, though fishing was poorer there. Thus the men of Stornoway Bay and Eye, of eastern lochs and of the Harris bays, like those of Loch Roag on the west, have long been partly fishermen. In the extreme north, too, men of Ness—with the chance of choosing their fishing grounds on the north, west or east of the island and with their little rocky port giving shelter, of a sort, from south-west gales—were good fishermen; they are good seamen still. "The fishing of the Barvas folk" is an old gibe,

175 632 427 [241] [624] co-operate in active endeavour. It was all the more important to have an elected 'official', the Constable, one of themselves but placed in authority. There could be no restitution of the old joint farms where they had been broken down by migration. Yet it should have been still possible to extend the old spirit to the larger townships, as the Commissioners held.

175 632 423 671 Again, the constitution of the township is bound up with the rights of common pasture upon the moor all the year, and in winter even on unfenced arable; but the Crofters' Act failed to regulate the rights and obligations of Common Grazings. It slackened the authority of the estate without restoring the hold of the tenant community upon its members. After five years the Government began to recognise the mistake, and passed the first Crofters' Common Grazings Regulation Act, permitting the crofters to elect a Common Grazings Committee. But it was ill-considered; most of all because non-crofters, that is, cottars and squatters without legal tenure, were not bound by the Regulations. On one hand they could not get permission to 'resume' (or enclose) a portion of the outrun, in order to reclaim it as a croft, without first obtaining the unanimous consent of the township's crofters; and in large [233] townships there might always be an objector. Yet each cottar could, and did, put on stock, a cow or two and a few sheep, so nullifying the possibility of discipline.

In 1908 a second Act was passed; but twenty years had allowed tradition to lapse and difficulties to accumulate. In Isle Scalpay (Tarbert) for instance, by 1909 there were only forty legitimate crofters, but eighty cottars; and [176] the legal crofters would not take part in depriving any [462] cottar of such grazing liberties as he exercised. All were neighbours and most were relations, and their principle

192 The circular, corbelled stone "beehive" huts, some still in good repair, are of unce
date. The best preserved are on the Morsgail Deer Forest, in remote situations w
make it almost certain that they were only occupied seasonally; those on the Garyna
common pasture are associated with assymmetrically ridged, curving, lazybeds.
however, need not imply permanent occupation of the site, nor does it solve the prob
of age; such lazy-beds are certainly old, possibly pre-potato (c. 1790 here) - but the
do not decay with age and may be very much older.

175 427 [624] Early in the eighteenth century the present area of the parish of Uig was held fro
Seaforth clan chief by 26 tacksmen, whose names are recorded in the judicial-rental
1718, (Fig.4). They, presumably, had sub-tenants but of these there is no record.
Elsewhere in Lewis the same rental records many small tenants holding direct off th
chief but in Uig, apparently, the tacksman and sub-tenant system remained intact.
Although we cannot be certain of their precise extent, the distribution of the tacks
[241] coincides fairly well with that of the better agricultural ground (Fig.2). Five of the
cluster round Uig bay, four were in the Valtos-Reef area, and three around the strait
Little Bernera. All these districts have machair; together they accounted for three
quarters of the meal and more than half the sheep and money rents. What is more,
rents represented 27% of the total rental of Lewis, whereas by 1887 Uig yielded only
[178] of the rental and by 1901 the proportion was reduced to 14%. The relative decline of
[369] Uig is largely due to the growth of Stornoway; this shift in the centre of gravity of Le
has tended to exaggerate the remoteness and isolation of Uig in the present century.

161 175 [624] [407] [490] [491] 000 By the end of the eighteenth century the tacksmen seem to have disappeared; at an
rate they are not mentioned in the remarkably detailed account of the parish given
in the Old Statistical Account, 1792. Meanwhile the small tenants had multiplied:
whereas in 1755 the old parish * had supported 1,312 persons, in 1792 the
minister recorded 1,898. At this time there was neither plough nor cart
in the parish. The minister was cultivating potatoes and his family were eating th

TABLE 3

AVERAGE STOCK HELD BY EACH FAMILY

162 178 • 233 422

	1792	1959
Cattle and calves	9.2	2.1
Sheep	13	37
Horses	1.8	-
Goats	0.8	-
No. of families	387	450

Note: the figures for both dates refer to the area of the old parish.

[632] * The old parish of Uig excluded the Loch Carloway district, from Kirivick north; this area lay in Lochs parish until 1891. Unless the old parish is specified figures quoted have been corrected to conform with the modern boundaries.
1. [See p. 2--Analyst]

The minister
was cultivating potatoes and his family were eating them
175 as an example to the crofters who were still reluctant to adopt the new crop. Some 70
[247] boats were fishing; this was mainly in Loch Roag for they were small open boats greatly
[226] outnumbered in good herring seasons by boats from other parts of the kingdom. To
encourage curing, particularly of white fish, the proprietor had set up two storehouses
[251] to supply salt; he, or his agents, were probably the only buyers - indeed John Knox, who
[441] visited Lewis about 1786, tells us that the estate factor held a monopoly for trading in
cattle, dried fish and other products. The absolute power of the clan chieftain seems
[614] to have survived in Lewis until impending bankruptcy forced the sale of the estate in 1844.
But it was kelp, more than fishing, that helped to support the people of Uig in the late
eighteenth and early nineteenth centuries. Lewis made little kelp compared with the
175 [332] Uists, but the Loch Roag kelp was of particularly good quality and commanded more than
[221] the average price. Further, many people from Uig migrated seasonally to make kelp in
Harris and Uist. Thus even at this time, the intrinsic resources of the parish appear
[233] to have been inadequate to support the population. In this connection it is worth noting
[162] the change in the average stock held by each family since 1792 as shown in table 3.
[178]

Clearance and Congestion.

175 Even after the end of the tremendous boom in kelp, brought about throughout the
228 Hebrides by the Napoleonic wars, some production continued in Uig. In 1825, when the
land rent of the old parish was £1,862, the proceeds of kelp, after deducting expenses,
175 yielded £1,010 to the proprietor. Thereafter it failed. Meanwhile Seaforth was attempt-
233 ing industrial developments and agricultural improvements. The former included short-
166 lived distilleries in Stornoway, the latter involved the removal of some small tenants in
order to introduce mainland farmers. For these Uig was particularly attractive, the
extensive mountain pasture offering good prospects for sheep graziers. The exact dates
427 of the formation of the earliest farms are not remembered nor are they precisely recorded,
[274] but at least as early as 1826 Alexander Macrae of Kintail had the tack of Scaliscro, with
the extensive grazings (now partly occupied by Bernera summer pastures) east of Little
Loch Roag. About 1823 the small tenants of Mealasta and Breanish were deprived of
Mealasta Island, which suggests that a sheep farmer was already installed in that
district. About 1838 all the small tenants were cleared out of Mealasta, six families
being put into Breanish; the remainder are said to have been sent to America.

175 In Bernera island, Kirkibost was cleared about 1822, having been lotted in individual
crofts some years earlier. Thereafter Kirkibost formed part of the large farm of
427 Linshader. Little Bernera, too, formed part of this farm. On the mainland, opposite
Bernera, small tenants were cleared from the shores of Loch Roag (e.g. Strome and
Drovernish) in the early nineteenth century, and a tacksman was installed at west
Earshader. Further east the small tenantry were cleared from Ceanhulavaig and
Linshader.

175 By 1844 the kelp shores were almost valueless to the proprietor (though seaweed as
fertiliser remained a vital necessity to the small cultivators, often working the same
land year after year). In 1841 the Chamberlain of the Lews suggested to the Select
Committee on Emigration that some 6,000 persons should emigrate because the land was
inadequate to support them. In 1844, of necessity, Seaforth sold the island. The
[162] population of Lewis was then 17,000 (Uig 3,316); little did the Chamberlain imagine that
in the following ten years it would increase by 16%, and that by the turn of the century
would reach almost 30,000, (Uig 4,462 Figure 8).[1]

1. [See p. 18--Analyst]

175 The new proprietor was no better placed than Seaforth to change the fundamental
427 causes of recurrent poverty and distress. But at least he had funds to ameliorate hi
tenants' lot and to allow experiments in land reclamation and industrial development.
[233] Existing sheep farms were extended and others formed. Land reclamation went forw
[319] hand in hand with industrial experiments such as distillation of paraffin from peat and
brick and tile-making. A programme of road building was begun (the first roads bey
[397] Stornoway were begun in 1791, but there were only 45 miles of road by 1836). In Uig
[499] results were very obvious. Further clearances took place particularly from Timsga
[726] Carnish (21 tenants), Reef (22 tenants), Garynahine, Dun Carloway. The small tena
Valtos and Kneep were only saved from eviction by the intervention of the Fisheries B
[162] for they were important places for white fishing. By the 1850's, although the populat
of Uig was more than double that in 1755, and 60% greater than in 1800, it was crowde
[168] into little more than half the area. Emigration enforced by clearances reduced the p
lation of Bernera and South Uig by nearly 500 between 1851 and 1861.

175 No other part of Lewis saw so many farms; nowhere else did the small tenants su
427 so much from eviction. That was not all. Those who remained undisturbed were de
prived of some of their traditional grazings and access to the rest was sometimes
311 restricted. Moreover they had to make room for many of the evicted families in the
233 own townships, thereby further increasing the problem of congestion caused by the ra
[161] natural increase of population. Thus, for example, about 1825 there had been 22 far
[162] in Valtos and Kneep. By about 1880 there were almost 100. But, during the same
period these townships were deprived of their island grazings - Pabay, Vacsay, Flod
and Wiay - formerly used for wintering cattle - and of part of their hill grazings (the
traditional shielings). Use of the hill-grazings was restricted, too. Thus, for exar
only one day was allowed to pull heather for ropes; if men were away fishing or for o
reasons, could not attend on that day, they risked punishment by going on any other. S
stories could be multiplied many times.

[103] In the Bernera district, by the 1850's, only Tobson, Bosta and Breaclete (on the
island) and Earshader and Crulivig (on the mainland) were left for the crofter famili
Moreover their traditional summer grazings, which lay south east of the Deer Forest
which was formed out of the Scaliscro sheep farm about 1850. Apparently their use o
the old shielings was tolerated until 1878, after which date they were directed to the a
north of the present road and which they have continued to use until the present day.
the shieling huts shown in fig.5 all post-date 1878; the area in which they lie may hav
been part of the West Earshader tacksman's holding. The date of discontinuance of t
tack is not known but the house, now empty, was for long occupied by squatters and th
old lazy beds around it still form part of a large squatter holding.

It is noteworthy that almost all the clearances were in the Bernera and South Uig
districts and this is reflected in population changes between 1841 and 1851, shown in
table 4.

The cleared areas included extensive hill and mountain grazings and some of the be
wintering ground, including all the machairs except Valtos and Kneep. The East Loch
Roag and Carloway districts were less attractive to the new farmers; as is so common
the case in Lewis, their rough grazings lay on gently sloping low plateaux and were con
sequently ill-drained and of poor quality. About 1852 Dun Carloway was let as a tack b
was never successfully farmed and was soon returned to crofter-occupation; it may n
have been wholly cleared of crofters. Garynahine, at the southern end of East Loch R
next to Linshader, was also turned into a farm about 1852. Here the hill grazing was
extensive and, though seriously reduced by a crofter settlement scheme c. 1936, it ren

trouble; and neighbours come to suffer too!

Turning to natural things, how far could the people observe and think rationally, free from the intervention of imaginary beliefs? The Gael possess common sense, keen observation, ready wits and accurate memory. They show powers of tracing effects to their cause; and on the whole, their agricultural practices were based on good sense, and their knowledge of nature was wide. Before taking a social decision, they reasoned together to good purpose.

In the ordering of family life, their ideals were founded on common sense and human feeling, little interfered with by superstitions. Irrational prohibitions too often restrict the issues of life where it is already severely limited by environment. A word should therefore be said of the bearing of beliefs upon the physical aspects of mating and parenthood, and of Gaelic teaching upon these. To begin with an early experience among all peasantry, during calving and lambing today shepherds, cattlemen and dairy-maids show delighted tenderness—there is no other word for it—in the care of mother and new-born offspring, though at other times they may be quite rough-and-ready at their work. What is true of hired farm-hands is still truer of a crofter's family tending their own precious stock. When out herding, boys and girls, before and after puberty, have to be exact in reporting when a bull has served a cow, so as to tell whether or no a calf is to be looked for next spring.

At the same time, human facts were not left to be learned only by observation of animals, but were simply and frankly taught. In a parent's verses to a maiden, for instance, marriage is spoken of tenderly but frankly, in words which can hardly be translated literally without over-emphasis to most English ears. There is a place for

TABLE 9

233 hundred and thirteen - but most crofters had from forty-five to one hundred and twenty. Wedders are sold at two-three years old when the mutton is said to be at its best.

231 Parts of the common pasture - usually the machair, are set aside for wintering hogge
[427] but the usual practice is to keep as many as possible on the croft. The soum as a whole is not enforced but shares in the wintering parks are adhered to. For example:- Timsgarry Glebe is leased to Crowlista and one share entitles a crofter to winter twenty-five hogge
[232] on the machair - in practice it is the best hogge that are sent. The minister at Timsgarry, who is much interested in sheep husbandry, has bred a heavier sheep with longer legs by crossing the Hebridean blackface with Swaledales and these seem to be doing very well; the minister is more attentive to his sheep than are many of the crofters, but some local crofters are showing interest in this crossbreed. The lambing percentage, so dependant upon the winter and spring weather, was about 80% in 1959 and this was regarded as good.*

Enquiries show that some crofts in each township far exceed their souming but because others carry no stock the four townships are understocked according to the total soum, here expressed in cow units. Sheep stocks in Timsgarry approximate to the sheep soum, Crowlista is overstocked by 130%, while the other townships are understocked.
[235] Some of the figures used for sheep stock were approximate or estimated. Nearly all crofts keep some poultry and surplus eggs may be sold to the grocery vans.

The rhythm of work on the croft during the year is shown on Figure 16, overleaf.[1]

241 Part of the hill common west of Crowlista was cultivated until the beginning of the
175 present century, at which time the township was overcrowded with two or three houses on
[361] each croft. A similar area west of Carnish was cultivated and old lazy beds, now grazed, are to be seen on slopes south of the road in Ardroil, in the valleys of Amhuinn Thoraghain and Allt a'Gharaidh and on the Borranish peninsula. The ruined shieling huts for this area, still to be seen around and beyond Loch Suainaval were in use until 1934 - '35. (Figure 5).

464 Ancillary employment is sought by all but nine of the thirty men under sixty-five in these townships and the wives of two of the 'full-time crofters' have regular employment.
228 There is no commerical fishing by local boats though the Bernera lobster boats are seen frequently off Uig Bay. The ruined curing house and piers at Crowlista, and the 'port' shown on the O.S. map near the site of the clachan in Carnish, point to the former importance of fishing.

288 At present the weaving of Harris tweed from yarn supplied by the Stornoway mills is more lucrative. There are two looms (plus one other weaver) in Carnish, two in Ardroil, three in Timsgarry and two (plus one other weaver) in Crowlista. All these looms were in use and two tweeds woven a week bring in a useful income but the supply of weaving is irregular. The future security of these weavers depends on the prosperity of the Harris tweed industry.

464 Mitchels's sand and gravel quarry at Carnish provides employment for from three to
[316] ten men. Five men from Ardroil and one from Carnish are employed there at present.
[912] The Aird R. A. F. station draws most of its civilian employees from Aird Uig but two
[377] Ardroil men work there. One Crowlista man is employed at the hydro-electric shcemo
[446] site at Gisla and this work will last for another year or two. Employers recognise the particular needs of their crofter employees and 'days off' are allowed for sheep fanks and other necessary work.

* The minister's ewes gave 103%.

[1] [For Fig. 16, see page preceding p.38--Analyst]

133 The 1,700 acres of common pasture stretch to the east and west of the crofts, across
[231] the peninsula which terminates in Gallan Head, extending to those of Crowlista and Valtos
654 in the south. The whole coast is broken and rocky, the land inland is peaty, and Aird lacks the advantages of the machair land found further west. To the north of the village there is now an R. A. F. radar station on Rudha Caol, built on what was part of the common pasture. It dominates the landscape and makes a considerable difference to the life of the inhabitants.

361 The township, though isolated, is reached by a good road which leaves the main road
[491] at the western end of Glen Valtos. Grocery vans call on Wednesday and Friday, a
[443] butcher's van on Saturday, and the local people are also allowed to shop at the N. A. A. F. I. within the Camp. The road through the village approximately follows the line of the 100 ft. contour and all the houses are built directly on to the road, with byres, weaving sheds and other buildings behind, whilst in most cases hens are kept on the steeper slopes below
[205] the road. Thus the settlement has far more of the appearance of an English village than
[342] have most crofting townships, but there is no shop or post office. The majority of the houses are stone with slate roofs and fairly large, though some of them have been built for
[354] more than fifty years. All have electric light and their own water supply and several have
[312] modern byres.

427 There are ten crofts, as the enlargement of one of the original nine was subsequently
311 split off to make a separate croft. Of these, one tenant is an absentee and another an elderly woman who does no cultivation. In both these cases, grazing is let to others so
[491] that there are actually eight operative units. The crofts are fenced in their upper portions, but in most cases the fencing does not extend down to the river and there is free access to the single concrete footbridge which spans the stream.

241 The only crops now grown are oats and potatoes and a few vegetables, with some sown grass; natural grass provides most of the hay crop. Lime and shell sand and artificial fertilisers are used; the two former particularly on the ground near the river where the cultivation is in narrow strips separated by drainage ditches and ploughing is done by horse.
[407] Most of the cultivated land is on the gentler slopes behind the houses, where the use of a
[354] tractor is possible. Before 1914 most of the land within the original turf dyke was culti-
[824] vated; here was grown and ground at the mill for meal for barley bread. Seaweed was
[231] extensively used as a fertiliser and most of the families kept eight or nine cows, so that there was a more plentiful supply of manure. Now, six of the families each keep one cow for domestic milk supply (two of the others each keep a goat). The township possesses no bull, but make use of those at Valtos or Ardroil.

233 On the other hand, the sheep soum is generally exceeded; instead of the entitlement of about 200, the total flocks grazed on the township pastures are approximately 500. The lambs are weaned early in August and put on Rudha Caol (Air Force use has not prevented this) and wedders are usually sold at the age of two or three years in Stornoway - many in October to reduce the numbers that must be pastured during the winter.

162 The total resident population of Aird consists of fifteen males and sixteen females. Of these, twelve are over 65, six are aged 45 - 64, 11 are in the 15 - 44 age-group (there are only three married couples) and there are two children under 15. Nevertheless, most of them are complete families; only one person lives alone; no members are reported as
[166] periodically working away, no men and only two women are permanently away. Neither has there been much emigration since 1939 - five women only have married out of the parish. The tenants of seven of the crofts are over the age of 65, the only one in the 15 - 44 age-group is a new-comer to the district and does little croft work.

[1] [See p. 45 for discussion of chart--Analyst]

175 the crofts at Kneep are still highly fragmented: the fifteen crofts comprise over one hundred
311 and eighty separate arable plots. The lotted crofts at Reef were cleared in 1842 to provide
427 land for a sheep farm. Plans to clear the remainder of the Valtos peninsula were thwarted
(228 by the Fisheries Board because Valtos and Kneep were then good centres for the white fish
(50) industry. As late as 1892 Valtos and Kneep had forty boats, providing employment for one
[464] hundred and forty-five men. Valtos with thirty-two boats and one hundred and twenty
fisher-men was second only to Carloway as a fishing centre in Uig. With the prosperity
of the fishing industry, the population of Valtos and Kneep had risen rapidly - from 467 in
1841 to 659 in 1891. Some, at least, of the subdivisions of Kneep date from this period.
Reef was scheduled by the Deer Forest Commission (1896) for resettlement by crofters
and in 1908 an attempt was made to do this, but agricultural experts advised against it, on
the grounds of poor water supply, scarcity of arable land (only ninety-three acres old arable)
and the risk that, if cultivated, the machair would suffer wind erosion. Nevertheless, in
1921, Reef was resettled by ex-servicemen from Valtos and Kneep. At the time the sheep
● [233] farm was only carrying a stock of one hundred and seventy sheep - less than half the crofters'
sheep stock in 1959.

427 Tables 15 - 18 summarise the more significant points of the economy of the Valtos
178 peninsula. Table 16 illustrates the fact that the economy is in decline. Only two-thirds of
the total possible units are being worked. Many of the crofters have abandoned their crofts
[162] and the younger generations are unwilling to take over. Of those remaining to work the
crofts 18% are over sixty-five, and a further 47% are between forty-five and sixty-four.

632 311 427 [162] There are 37 crofting townships. In area they extend from 9,000 acres (Linshader) to about 500 acres (Croir, excluding de facto shares in Bernera Shielings). The number of crofter tenants ranged from 4 in Ungshadir and Earshadir to 61 in Breasclete, and the average amount of land available to each crofter is 7.2 acres of inbye and 126 acres of common pasture (table 10). Averages are misleading. As the table shows, between districts the amount of land available per crofter varies from about 50 to 500 acres; as between townships the range is even wider (table 11). To some extent this contrast is the result of resettlement schemes which, in general, attempted to provide new holdings sufficient to yield a family living. The extent to which they were successful in this respect was limited by political pressure, especially in the 1920's, to provide the maximum number of holdings. Nevertheless the re-settled holdings have twice the average areas of both inbye and common pasture (13.3 against 7.2 acres, and 225 against 126 acres, respectively).

TABLE 10

NOTE: The distinction between "holdings" and "working units" is explained in the text.

427 632 311 Even amongst the old-established townships there is a tremendous range in amount of land available per tenant, the southern districts being best placed and those in the north worst, a situation which still remains. Indeed, the contrast in land available as between tenants (table 11) is a fundamental one; surprisingly, it is not on the whole reflected by a corresponding contrast in stock carried. Together with the rarity of effective fences between or within township pastures, the impossibility of properly hefting sheep to the hills when each crofter keeps his own little pack, and the excessive sheep/cattle ratio, this gives rise to serious problems which will be examined in Part III.

f rent" (presumably 1912 rent).
. The rents had been substantially
irrent. Any township has a certain
l rental is thus changed without

233 change in area, then the amount of stock allowed, per pound sterling of rent, ought to be
427 changed, too.
656
[175] This does not appear to have been done in Uig although in Stornoway parish the soum per pound was increased after rents were reduced in the late nineteenth century. More recently, the Crofters Commission, in re-stating soumings for some townships, has generally (but not invariably) applied the soum to the 1886 rent, regardless of the wording of the 1912 regulations. This may appear to have the merit of consistency and, insofar as crofters pay any attention to the Regulations, it satisfies them because the greater (1886) rent gives them a larger soum and less likelihood of being criticised or penalised for overstocking. However, it perpetuates inconsistencies which originated during the nineteenth century when the stock allowed per pound sterling rent was not reduced although total rentals were increasing as squatters' and cottars' holdings were added (see page above). Moreover, the old souming referred to the old type of highland cattle which were much smaller beasts than those kept today, and it assumed that the shieling pastures would be in full use. A further complication arises because about 1920 some townships acquired substantial enlargements but the soumings do not appear to have been adjusted. Altogether it is little wonder that the Grazing Regulations are seldom observed, for they seldom bear any close relationship to the grazing capacity of township lands. Proper observance of carefully revised Regulations, in which unlimited substitution of sheep in place of cattle was specifically forbidden, would be of considerable benefit to the crofters.

241
233 The inbye, or croft, land is invariably separated from the common pasture by a ring
417 fence, the gates of which are generally closed for protection of crops from May to
[178] November. Progressive townships are installing grids to obviate the twin nuisances of traffic interference and straying stock. The fencing of individual crofts was rare until the 1930's and is still by no means general. The inbye land is, in many townships, the best winter grazing and its division into innumerable tiny fenced patches, whilst advantageous for cultivation, would restrict the movement of stock in search of water and shelter; in a predominantly pastoral economy complete enclosure of individual holdings is not
[184] necessarily an advantage. This problem will be discussed in Part III but, in the present context, it is relevant to point out that the small crofts of Lewis contrast strongly with the larger ones of, for example, the Uists and Tiree. Therefore, what may be advantageous in the latter may be retrograde in much of Lewis.

The lay-out of the crofts aggravates this problem. The long narrow strips of the 1850 lotting, well-suited to spade cultivation and common winter grazing, may require four or five times the length of fencing required by an equi-dimensional croft of similar area. If fenced the stock may be deprived of both water and shelter; since arable cultivation has become relatively unimportant a suitable solution to this problem might be to fence a small potato plot near the house and to put the rest of the inbye down to sown grass in three or four communal parks in which grazing could be properly controlled. A particular problem is posed by crofts which have been sub-divided. These may take the form of strips as much as half a mile long by 10 yards wide or, more commonly (and much worse), of piece-meal sharing of innumerable plots, a system known locally, but incorrectly, as 'run-rig'. This is seen at its height in Kneep (fig 22), where every croft in the township is affected. The problem does not arise in townships with large crofts, which are usually more nearly equi-dimensional. These are mostly the result of re-settlement schemes and have long been fenced, (see, for example, figure 15).

Crofter-tenants.

162
427 An analysis of crofter-tenants according to age, sex and occupation (table 12) provides
463 several important clues as to the present unsatisfactory state of crofting. More than one-third of the tenants are over 65 years of age; a further 16% are absent, some of these may also be over 65, others are younger people working away from home, a few are tenants

162 of crofts in other districts, despite the legal requirement that a tenant shall reside within
427 two miles of his croft. Thus half the crofts in the parish are tenated by persons who
463 cannot be expected to make the best use of them. This implies no criticism of the people concerned, it is a criticism of the system. Of 314 resident tenants under 65 years of age, 43 are women; of the men, 170 have regular employment including fishing or weaving, 55 take casual or seasonal work as and when they can get it. Only 46, or 7% of all tenants, are "full-time crofters" and, in fact, most of these are either invalids, disabled, or over 60 years of age. Thus in Uig, unlike the southern Outer Hebrides, most crofts are at best a spare time occupation, at worst merely a house site carying special privileges. The table also demonstrates that the size of crofts has little bearing on occupational status; this is inevitable in a rigid system under which a man has no control of varying the size of his holding according to his needs. Some young tenants inherit crofts far too small for their family needs, whilst many elderly tenants, and women, have crofts which are too large for them to maintain.

241 It is not surprising, then, that many tenants do not wish, or are not able, properly
427 to cultivate or stock their crofts. A few, however, are particularly interested in agricultural production as a means of livelihood. Some of these have acquired extra crofts, and so built up much larger units. This may be done by acquiring tenancies either in the crofter's own name or that of his wife or a close relative, or by sub-letting. About 30 crofters in Uig are tenants of more than one holding, at least 20 work holdings held in the name of close relatives, and at least 120 have sub-let holdings. These figures are certainly too low: sub-letting without the consent of the proprietor or Crofters Commission is illegal. Nevertheless it is common, and it is generally unsatisfactory because the sub-tenant has no security of tenure and no right to compensation for improvements; consequently sub-let crofts are often neglected and sometimes over-grazed as well. Controlled sub-letting, for a stated minimum period and with the right to compensation, would regularise a well established practice and encourage the formation of larger units, better able to support a family.

A converse of sub-letting is unofficial sub-division. There are a few cases of cottars - usually relatives living in a second dwelling house on the croft - sharing the croft with the t ant; but this formerly widespread practice has all but disappeared. Such de facto "crofters" share the common grazings, as do "squatters" - persons with houses on the
162 common land - who keep stock. Thus neither the number of crofter-holdings on the rental
241 (699), nor that of crofter-tenants (663), is any guide to the effective number of potential
427 agricultural units. Of the crofter-tenants, 100 are absent and some of those who are resident sub-let their crofts. After making these allowances the number of de facto holdings becomes 518; to these must be added 39 cottars, squatters and others (including a few tenants of council houses) who keep at least a cow or five sheep, and 23 agricultural holdings without crofter status. Thus there are 580 potential agricultural units in Uig.

[233] That is not all. Of these 66 have no cattle, and 162 carry less than half their soum,
241 of which 22 have no stock at all. Little more than 400 holdings can reasonably be said to
427 be agriculturally effective. This is an indictment, not of the crofters, but of the agricultural structure of the system. This neither provides viable holdings nor does it enable those who wish to acquire enough land to be agriculturalists to get it, even though much land lies unused or ill-used. In short, the system is too rigid. In consequence, de-population goes on apace whilst potential resources are neglected. Three-quarters of a century of legislation and financial aid have, in the main, encouraged the development of crofts as homes for the elderly and as hobbies for those in other employment. Very reasonably, many crofters complain. But very few realise-or are willing to admit - that the security of tenure and other privileges won in 1886, if too rigidly maintained, may ultimately bring about the decay of the very communities which they were intended to protect.

Figure 15.

ARDROIL CARNISH and TIMSGARRY - lay-out of crofts formed from farms in 1921 Compare fig. 14

/facing p. 37/

361 491 487 499 365 366 494 312 Many of the original houses are ruined or used as byres. Figure 14 shows that new houses have been built near the sites of the old ones but sometimes nearer the road - all but four houses have easy access to the road. Crowlista is linked to the main road by two miles of rough gravel side-road, and by a footpath and ford via Timsgarry. Vans call but there is no Post Office, store nor bus service. At present water supplies are poor - two wells only are in use.

Carnish is served by a short unmetalled road and all houses have good access to this. W supply is good; water may be stored on the high part of the crofts and piped into the houses. The roads serving Timsgarry too, are unmetalled, but the main road is less than a mile away. This 'main road' from western Uig to Stornoway runs through Ardroil and all except one of the houses not near to it have good drives suitable for lorries. Ardroil has a store and Timsgarry a Post Office. One butcher's and two grocers' vans call weekly and the travelling bank fortnightly. The thrice-weekly bus service to Stornoway (return fare almost £1) ceased in 1960 because of competition from privately owned vans and cars. 366 205 453 494

241 231 467 The cultivated land is in strips usually large enough for horse or tractor work; the smaller potato patches are hand dug. Few horses are kept now, Timsgarry, Ardroil, and Carnish have one each and Crowlista none. Crofters hire these horses or tractors from Brenish or Enaclete. Oats and potatoes are the only crops grown in quantity, small patches of turnips are found and most crofters grow root vegetables. Kale was seen growing on one Ardroil croft; this was an experiment and seemed to be very successful. Bere and rye are no longer grown. Grass mixtures are sown in order to qualify for cultivation grants. Oats are undersown, or grass seed may be sown after the oat harvest, and left for hay for several years - some sown twelve years age was said still to be giving very good hay, but on the whole very little grass is sown in Crowlista. The acreage of natural grass cut for hay varies a good deal with the weather and the time and labour available. Crofters find this difficult to estimate as well, as often small irregularly shaped pieces are cut and the figures, therefore, may not be accurate. (Appendix A).

One excellent garden showed that a rich variety of vegetables, fruit and flowers can be grown if adequate shelter is provided and the time for cultivation is available, but few crofters have the necessary knowledge or interest.

242 134 324 Lime, dung and artificial manure are widely used, though on some Crowlista crofts the compound fertilisers were in use for the first time in 1959. Shell sand is used on the crofts which have peaty soil. Although it is agreed that seaweed and dung are the ideal fertilisers for potatoes, seaweed is only occasionally used. It is becoming difficult to obtain locally and much heavy work is involved.

231 Each of the thirty-five operative units which carry any stock at all has a cow for domestic milk supply and manure. If the family is large or many visiting relations stay on the croft during the summer the calf has to be sold early; otherwise it will be reared until the cattle sales in September or May. Only eight crofters had two cows; fifty years ago four were commonly kept. Only thirteen of the units had young cattle other than calves. One crofter was rearing a kid for milk.

The bull supplied for these townships and Mangersta is an Aberdeen Angus which is wintered on the Ardroil machair.

233 It was sometimes difficult to obtain factual information about sheep and it is difficult to generalise. Operative units without sheep were those where no suitable labour was available. In a few cases crofters considered that sheep were 'not worth the trouble' - but others were building up their sheep stocks. Individual flocks ranged from ten to two

491
494 Brenish, at the end of the tarred road which also serves Islivig, is forty miles from Stornoway. On the thrice weekly bus the return fare to Stornoway was £1, and freight cost half-a-crown for a hundredweight, but because of competition from privately owned vans the bus service ceased in 1960. Mangersta is reached from the same road by about a mile of untarred side-road of indifferent quality; formerly the only access to it was by a footpath over the sands to the south. General merchandise, fish and meat are supplied by weekly vans; there are no shops. There is a post-office at Islivig; banking facilities are supplied by a mobile bank.
366
205
453

311
427 The majority of the crofts are long narrow strips, with those in Mangersta being somewhat more compact. The area ranges from two to nine acres, with an average of about four acres; in Brenish and Islivick only about half is usually arable. All the crofts - or croft-units - are fenced, the work having been completed in Brenish in 1959. There are twenty-nine crofts in the rental for Brenish, ten for Islivick and thirteen for Mangersta; but, owing to amalgamations of various kinds the number of operative units is considerably less - fourteen in Brenish, five in Islivick and ten in Mangersta. There are no cottars.

134
407 As soils are reasonably good and comparatively free from rocky outcrops, the arable patches are large enough to be cultivated with a horse or tractor. There is a tractor in Brenish, and four horses, a horse in Mangersta and two in Islivick. All of these are hired for ploughing and carting peats. Very little work is done with the spade, unlike many of the other Uig townships.
231

233 While the general rhythm of township work through the year is similar to other areas, here the sheep are wintered up on the hills; some crofters winter lambs on their crofts. Brenish crofters are allowed to winter eight sheep, (or sixteen hogg, or four year-old heifers), on Mealasta Island - hogg are usually sent since their loss, by falling over the cliffs, is less serious than the loss of heifers. Eilean Molach is used by Mangersta crofters, who are allowed two sheep each in summer.

241 The only crops grown are potatoes and oats, with "black oats" (Avena strigosa) on the sandy soils in Mangersta. Since seed for "black oats" is unobtainable commercially, the crofters save their own. A grass mixture is sown by the majority of crofters for hay, to qualify for the subsidy.

233 The extensive hill and mountain pastures are not separately fenced; sheep from all three townships graze over all. If the total sheep stock of the townships (about 3,300) is compared with the souming figures it is found to exceed the soum by about 50%. On the other hand, fewer cattle and horses are kept than formerly so that taking the total stock for all animals (horses, cattle and sheep) and comparing with the actual stock now carried, the area carries only 87% of the stock which the soum allowed. In the two older townships the souming was reckoned according to rent, being one cow, one two-year old and eight sheep for each £1. In Mangersta, however, the soum was one horse, three cows, one heifer, two stirks and twenty-five sheep for each croft.

Lambing percentage is about 80, and ewes form about 60% of the total sheep numbers (excluding lambs). In this district some wedders are kept for three years and then sold for meat, but the main income is from wool, about three pounds weight from each sheep, which sells at up to four shillings a pound.
236
435

231 Most crofters keep one or two cows, and the calves are normally sold in the autumn or spring sales. Brenish and Mangersta each have a bull, and in the three townships there are sixty-seven cattle and thirty calves. Shielings, formerly used for about seven weeks in

231 summer, were last used for cattle six to eight years ago by people in Brenish, but none are in use today. These shielings were at the western foot of Mealisval, only about a mile from the township. The Brenish 'distant' shielings, about six miles to the south-east of the township across the mountains, were not used after about 1920, while the adjoining Islivig shielings were last used in 1922. Mangersta may have had its original shielings to the east of Loch Melavat about a mile south of the township, but after obtaining the enlargement from Mealasta farm, until about 1939, shielings were used in that area.

314 No peats are cut on the crofts; the peat-cutting areas for all three townships are near the road and in no case far from the township. The common pasture near the crofts bears
241 evidence of former cultivation, but it is at least fifty years ago since crops were grown on it. At this time the townships of Islivig and Brenish were over-populated with many cottars living on the crofts and all possible land on the crofts was already under cultivation. Today, less than half this 'old arable' is being cultivated, and in several cases the land is used solely for hay and grazing.

342 There are now no thatched houses inhabited in the townships and most houses have kitchen and other extensions added. Some crofters have built concrete two-storey byres
312 of modern design. In Brenish, where the hills to the east provide a good catchment area and the Brenish river a good source of supply, all the crofts have their own private piped water supplies, while in Islivig and Mangersta most crofts now have, or are getting, a
377 water supply. All croft houses are supplied with electricity from the grid.

226 Commercial fishing has long ceased and as there are only three boats there is now very
501 little fishing for domestic use, the principal use of the boats being to ferry sheep to the off-shore islands. Weaving is an important occupation. There are seventeen weavers -
286 nine in Brenish, two in Islivig and six in Mangersta, and during 1959 they were kept busy;
464 in 1958, however, few orders were received. Weaving cannot be said to bring in a steady
[434] income here, and some of the weavers, and others, find additional employment outside the township - this includes four men at the hydro-electric scheme at Gisla, three at Mangersta Ministry of Civil Aviation station, three at Aird R. A. F. station and at least
[467] one in the Glen Valtos quarries. In addition, one man owns a tractor which he hires
[495] out, and one, owning a lorry and van, does haulage work. Altogether, out of a total of twenty-seven men under sixty-five who do work, all but three (one just out of school and one a semi-invalid) have other employment in addition to their crofts.

162 The total population for the three townships is one hundred and twenty-one residents, and fourteen permanently away from home. Of the residents, twenty-eight (or 23%) are children of, or below, school age, forty-seven (39%) are in the 15 - 45 age group, 15 (12%) are in the 45 - 65 age group, and 31 (26%) are over 65. Of the resident tenants, thirteen are over 65, twelve under 45, and five between 45 and 65.

181 The relatively young population may help to account, together with the better soils, for this area giving an impression of a fairly prosperous crofting district compared with some of the others in Uig. Amalgamation of crofts into larger units has also gone further. The use of a tractor or horse for ploughing, extensive use of artificial fertilisers, the sowing of grass seeds and the sale of sheep for meat, all seem evidence of a group of people who are determined to make the most of their limited resources.

233 One enterprise, that of the Aird Bheag sheep farm, deserves special mention. Four crofters (three from Brenish and one from Islivig) have purchased from the Uig shooting estate about 2,000 acres of land on the Aird Bheag and Aird Moire peninsulas, five miles south of Mealasta. Here they are running a flock of about five hundred sheep. There is

233 no road and access by foot is difficult. To reach the grazings the crofters travel by boat from Mealasta several times a year and stay in one of the two houses at Aird Bheag which although vacant, is still in repair. These houses were formerly occupied by estate employees who had crofter status.

511 From the above account, it is evident that in this district as in others, a single croft is not sufficient to support a crofter and his family. On an average, each resident crofter has acquired the equivalent of two crofts, and in addition each crofter supplements the meagre income obtained from his croft by some other occupation, e.g. weaving, labouring or driving.

CHAPTER FIVE

THE UIG BAY DISTRICT

(Carnish, Ardroil, Timsgarry and Crowlista)

by

Elizabeth Blowers.

134 Uig bay, in which low tide reveals several hundred acres of pure white sand, is surrounded by crofting townships. There are no extensive machair plains but the shell-sand forms a fringe of easily cultivated, lime-rich soils on all sides except Crowlista, and, blown inland by the Atlantic winds, it modifies and improves the texture and acidity of the
361 peaty soil as much as 2,000 yards from the shore. It is not to be wondered at then, that
[175] this bay at one time formed one of the most important centres of population in Lewis. Signs of ancient cultivation, and the ruins of old clachans, are widespread, but most of the present settlements are less than forty years old: almost the whole area was cleared to make farms in the early nineteenth century. Only in Crowlista, with its thin, rocky, arable land and almost complete absence of machair, were the small tenants left undisturb
[121] Consequently the district provides an opportunity to compare "old" and "new" townships, both as to lay-out and operation.

133 Carnish, in the south-west, is dominated by a huge gravel ridge - probably an esker, -
361 over a mile long and sloping steeply to the estuary of Amhuinn Chaslabhat with the rocky headland of Machair Carnish to the north. The arable land and houses of Ardroil are situated to the landward side of the hummocky machair land between the esturies of Amhuinn Chaslabhat and the Forsa river which drains Loche Suainaval and Stacsavat. To the north of the bay the old settlement of Crowlista is situated on the rocky headland to the west of the Rethall embayment; there is a good deal of level land in the centre of the township but the slope to the estuary in the north is steep and rocky outcrops occur on the headland. Timsgarry, to the east of Rethall, stretches inland between the headlands of Tolanish and Borranish along the valley of the Erista river.

134 There is a mantle of gravelly drift over this area; the Carnish esker has been mentioned and exposures of up to 120' were also seen in gravel pits in Ardroil and Timsgarry. Along the coast blown shell sand rests on this drift and reaches inland for up to half a mile

Table 27 shows the cattle soum and holding: there is a marked similarity between the Island townships, (all holding about one third of their soum), and the Shore townships, (three of which range from 60% to 100% and only one of which, Lundale, has less than 40%. That these averages are not misleading is proved by the fact that the scatter of percentages of cattle-soum held per working unit is less wide for the Bernera Island townships than for those of the Bernera Shore, bearing in mind the smaller number of units in the latter.

It is a little difficult to account for this, particularly when it is observed (Table 28) that there is no correlation with the percentages of the sheep stock held; the Island townships vary from having half their soum of sheep)Tobson) to double (Croir), and those of the Shore from a little over the correct figure to well over twice as many; but whereas the number of oversoumings for sheep is everywhere high and non-sheep-keeping croiters are rare, there are 10 agricultural units with no cattle and 25 with only one cattle beast. It

[128]

the Napier Commission in 1883; these show that the Bernera region now keeps less than half the former number of full grown cattle beasts but only a slightly higher percentage of sheep. It is an unavoidable conclusion that resettlement and enlargement has not led to greater agricultural efficiency: since it was carried out for social and not economic reasons, this is perhaps not unreasonable, but it augurs ill for the future of a community which must be largely dependent on agriculture.

Land Use and Cultivation*.

241
[231]

Before considering the details of stock management it is well to review land-use, for cultivation is subsidiary to, and directed at, stock keeping. Few crofts have no culti-

423 Stock - potential and actual.*

427 The croft is in almost every case primarily a stock raising unit and cultivation apart from certain items - particularly potatoes for domestic use - is connected with stock
231 rearing. The basis of the stock system is the soum, the share of the common pastures
311 in terms of horses, cattle and sheep. The largest total soums (more than two hundred cow-units) are held by Hacklete, Kirkibost and Tobson; all the other townships have a
632 hundred or less cow-units (Table 24). This has some relation to the size of common grazing. The very large area of Linshader is that of the former farm: the present

* Details of actual stock and souming for each township will be found in Appendix A.

231 Hacklete, Kirkibost and Tobson have by far the largest total holdings of stock but are
311 eclipsed in regard to percentage of soum actually held by Breaclete, Croir, and all the
632 Bernera Shore townships. In fact the average percentage soum held is 66% on the Island as against 114% on the Shore. If efficiency is interpreted in terms of stock rearing therefore, Tobson is less than 50% efficient, Hacklete and Kirkibost 50% to 75% Breaclete Linshader and Lundale 75 to 100%, and the rest 100% to 175% efficient, the average falling at 75%.

It is also interesting to remark the area of common grazing per cow-unit actually held. This shows that, in effect, the Bernera Island townships, as might be expected from their use of one main common grazing, have much the same amount of land per beast The Bernera Shore townships apparently need rather larger areas of land per cow-unit; the excessively large area shown for Linshader indicates understocking.

[427] Figure 29 summarises the incidence of soums and actual stock carried. It will be seen that, although there are some crofts with soums of under five and over fifteen cow-units, the majority lie between those limits with a marked peak in the 7.5 to 10 cow-unit class. The largest soums tend to be under-utilised. Figure 28 shows the percentage of the soum held. Almost a quarter of the working units have less than 50% of their soum and must therefore be considered as inefficient in their chief function of stock raising, about one third have 50 - 100% and rather less than 1/3 have over 100%

The incidence from township to township varies (table 25) but generally the Bernera Shore townships have more uniform individual soums than the older and larger Island townships, though the range of size of stock holdings and consequently of soums held is more comparable. Table 25 shows the average soum per croft or working unit: Breaclete and Croir are similar with only just over half the average for the rest of Bernera Island. None of the Bernera Shore townships have soums as large as the bigger Island ones, and one of them, Earshader has no more than Breaclete or Croir. Kirkibost and Tobson stand out as far the most generously treated townships, but is this justified in practice?

Expressed in terms of cow units, (table 25) the total soums reveal that, on Bernera Island, only Croir is really efficient with just over 100% of its soum: Breaclete, Hacklete and Kirkbost are satisfactory - and no more - with 60 - 80%, but Tobson has only 45% of its soum. This is a very much poorer showing than that for the Bernera Shore townships, only one of which drops much below 100%. Therefore on the Shore the soums, though smaller, are better taken up than on the Island. Further it is clear that, of the individual working units on Bernera Island, none of those of Croir are unsatisfactory, three out of sixteen at Breaclete are not satisfactory, five out of twenty at Hacklete, eight out of twenty-eight at Kirkibost and eleven out of nineteen at Tobson, whereas on Bernera Shore there are only two unsatisfactory units - at Linshader - one of which is presently vacant with a dispute over the tenancy.

231 But so far, only the total soum has been considered: in fact it is necessary to consider
233 the elements of that soum, for in order to maintain the pasture one must have a stock
311 suitably balanced as between cattle and sheep. When the soums were originally calculated this was borne in mind and were every soum fully occupied in the proportions originally planned, the balance of grazing would presumably be satisfactory. Table 26 shows the stock equivalents in sheep units. In Croir the soum would indicate a marked preponderance of cattle +, in Linshader (with its extensive hill lands) of sheep; otherwise there is a rough balance in the soumings between large and small hooved beasts.
[656] Occasionally there are special permissive or restrictive clauses in the regulations. For instance, on Breaclete township common grazing, "...a landholder...shall be entitled to graze thereon, free of charge, during summer and autumn, two hoggs for every pound sterling of rent, for replacing the cast ewes...". Similarly, in Linshader horses are not allowed on a fenced area of 800 acres, and on Little Bernera horses are specifically disallowed. But generally the various classes of stock have clear equivalents which are freely interchangeable. How does this work in practice?

---

[98] + Editorial Note: this was probably because, when the Land Court determined the soum, Croir had no share in Bernera Sheilings. This now calls for adjustment, which should be made when the Crofters Commission re-enact the local Grazing Regulations.

Tables 16 and 18 support the definition of a croft as a small livestock-economy unit, primarily concerned with the provision of milk for the family and young cattle and wool for sale. There are no cash sales of crops - the whole of the land-use is directed towards the subsistence of the crofter and his stock. The cereals (almost entirely oats) and the hay (occupying a very small proportion of land for a livestock farming region) are grown for winter fodder for the cattle and sheep. The larger part of the croft is given over to grazing - usually of poor to medium quality - which receives very little attention from the crofter. Less than one third of the holdings have sown grassland (and in these few cases it is normally less than half an acre) - a fact which suggests a passive rather than active attitude of the crofter towards his land.

In addition, every croft has its own small potato plot - rarely more than half an acre to provide for family needs, and most crofts (58%) possess a vegetable garden - again for house use.

Nearly all the crofts carry one or two cows - the second cow ensures a milk supply all the year round. Young stock are sold at one year to eighteen months old, rather than as calves - a result of the incentive offered by the calf-rearing subsidy. The milking stock is replaced very infrequently.

Where one croft differs from the next is in the numbers of sheep stock. Table 17 shows an even distribution of crofts with more than fifty and less than fifty sheep; but, in fact, over one third of all crofts have less than twenty-five sheep. Sheep are the only source of money income on the croft, except for the annual sale of the calf, and subsidies, and there is a considerable difference in the size of sheep stock between the truly subsistence and "retirement" crofts on the one hand and the "commercial" crofts on the other. Hence the souming figures, and here note the contrast between Valtos with the sheep stock equal to 111% of the soum and Kneep - 353%!

An attempt has been made in Figs 19 and 20 to relate the size of the stock carried on

TABLE 18
LAND USE

	Valtos	Kneep	Reef
Average size of holding:			
Old arable	2.5	4.1	11.0
Outrun	2.8	6.2	
Percentage of croftland under:			
cereals	7.5	7.0	6.0
potatoes	2.5	5.0	3.0
Sown grass (hay)	5.5	1.0	5.5
natural hay	3.5	10.0	4.0
natural grazing	75.5	76.0	75.0

An attempt has been made in Figs 19 and 20 to relate the size of the stock carried on the individual croft to the size of holding and to the availability and age of the labour force. In both diagrams there is a significant division between the subsistence holding (0 - 7 units) and the commercial holding (11+ units), but there is no definite relationship between stock and size of holding or labour availability. The inclusion of the points of equilibrium for certain lines in Figure 20 reveals a somewhat unexpected state of affairs: in the case of crofters with regular work and full time crofters, those over the age of forty-five carry a larger stock from those under forty-five. It is frequently argued that the solution to the economic problem of crofting lies in the amalgamation of holdings in order to create a more viable economic unit, but the indication from these diagrams is that an increase in the size of holding will not, of itself, lead to an increase in stock. It is the absence of accessible markets that deter the crofter from increasing his agricultural production.

In their present state the crofts in the Valtos area are unable to provide a livelihood for the crofter and his family. Of the crofters under sixty-five almost 90% supplement the croft income by other employment. Of these casual labour (at present mainly at the Gisla hydro-electric scheme) accounts for 57% regular work - particularly weaving - 43%. The combination of crofting and weaving provides probably the best return for the labour: one crofter with a croft of 3.3 acres, carrying two cows, two followers and ninety sheep (sixty ewes) made the following estimates for 1958:

FROM THE CROFT:	
Sale of two year-old calves	£80
Cow and calf subsidies	£40
Sale of wool at 4s. 3d. per lb.	£75
	£ 195 (1)
FROM WEAVING -	
at two tweeds per week (32 hrs. p.w.)	£550
GROSS INCOME	£745

Weaving abour 30 hours a week apparently leaves him sufficient time to run the croft efficiently; at present a crofter supplementing his income by a labourer's wage at Gisla hydro electric scheme would have to put in nearly sixty hours per week to achieve the same financial reward.

The economy of the Valtos peninsula has been changing, and contracting, for several years. The number of unoccupied crofts is increasing; commercial fishing ended at the time of the first World War; the shielings have been abandoned as summer cattle pastures. The Valtos shielings near Loch Scanadale were abandoned during the 1939 - 45 war, due mainly to the lack of manpower in the township, though some was used intermittently until 1953. The shielings of Kneep and Reef were abandoned in the late 1930's, at which time Kneep had some fifty milk cows as compared with fourteen in 1959.

1 Against this figure, must be set the costs of production (i.e. fertilisers, new seed, winter fodder supplements, sheep dips etc.)

The area under cultivation has contracted in the past twenty years. Before 1939 most crofts had about twice as much land under cultivation and at Valtos some were cultivating small patches outside the township fence. The cultivation of the common machair at Cliff ceased in 1939. The land had been "too long in labour" (potatoes had been planted on the same ground for nearly one hundred years), and the soil had been affected by over-liberal applications of sulphate of ammonia which replaced the traditional soot-impregnated thatch from the black-houses. Moreover the Cliff machair was particularly vulnerable to "blow-outs" after ploughing. Cultivation of the Kneep common arable has all but ceased, and the fifty-two acres of arable machair in the township of Reef have been untouched since the 1930s. It is noticeable that the common machair cultivation and the shieling economy ended about the same time. Smaller numbers of better-quality cattle were needed to meet the daily milk requirements of the croft; a much smaller area of cultivation was therefore needed to provide winter fodder and consequently more land was available on the croft for potato cultivation. Consequently the more distant machair was replaced by cultivation within the croft.

Contraction and decline of the economy is common to all three townships, but the form and cause of this decline is different for each, and where the township consists of two separate settlement nuclei there is frequently a difference between the two parts:

The township of Valtos is in two distinct parts: crofts 1 - 34 are a succession of narrow strips about ½ mile in length stretching from the shore to about 200' O.D.. The boundaries of the outer crofts (nos. 1 and 34) if projected to a point on Pabay, form an angle of 45°, so that the crofts are narrower at the shore (40 - 70') than at the upper limit (100 - 180'). Of these 34 crofts, 19 are in so-called runrig, eight in pairs and one group of three. (Fig. 21). Cultivation is carried out on numerous intermixed small patches, hold permanently; the grazings are interchanged at the year end. Fragmentation imposes a severe limitation on the economic efficiency of the croft. None of the crofts at Valtos is individually fenced though some groups of two or three are fenced together. With the contraction of cultivation only the less steep areas are cultivated, to facilitate ploughing.[1] As a result, the bulk of the cultivated plots are to be found at either end of the croft - near the shore and on the hill top against the township fence.

The remaining five crofts of Valtos, and a squatter, are at Cliff in the valley separating the Valtos peninsula from that of Aird. Here the crofts are fenced, more compact and slightly larger (4.8 acres as against 3.8 acres) and they occupy more level terrain than those in Valtos. Two of the crofts are worked in runrig - these being situated on the machair. The houses are set back about a hundred yards from the road, along the western township fence.

Kneep township is again in two parts: Crofts 16 - 18 together with the Manse and two cottars, are situated across the neck of the Glebe promontory, on the south side of the peninsula. The five legal crofts are today worked as three units, fenced, reasonably compact and with holdings of exceptional size for the area - average 15.1 acres. Crofts 1 - 15 at Kneep on the northern side of the peninsula adjoin those of Valtos. Here is a climax of land fragmentation, which imposes severe limits upon croft efficiency. Twelve of the fifteen crofts are worked; of these only numbers 4 and 5 are compact homogenous crofts; numbers 3 and 6 are compact except that part of the land which lies within their boundaries belongs to croft no. 13. The remaining eight crofts comprise a hundred and eight separate plots of croftland and fifty-two separate plots on the common machair. One croft with 2.8 acres arable the average size of each piece is a mere 0.15 acres! The grazing land on the croft is divided into strips running across the slope, which are interchanged each year, whilst a large part of the common grazing lands are divided into

1. Pre-1939 much of Valtos was cultivated in lazy beds - by spade. Today 9% is cultivated by spade; 43% by horse plough + 48% by tractor.

632 strips running across the slope, which are interchanged each year, whilst a large part of
311 the common grazing lands are divided into interchangeable sections ("quarters") to
427 accommodate each of the groups of crofts. See Figures 22 and 23.

233

The cultivable croftland at Kneep is relatively flat and the natural drainage is poorly
133 developed; the quality of this land, depends to a very great extent on the upkeep of a dyke
312 running across the croftland from a small marshy loch to the sea. This dyke has not been cleaned for several years, and as a result a large area has been invaded by reeds. Other parts of the croftland have been similarly overrun by 'wild rhubarb'. Such deterioration is almost inevitable when land is so fragmented.

The crofts at Reef are grouped in three separate localities. Crofts 1, 2 and 3, on the edge of the machair have probably never been occupied since the crofts were allotted in 1921 and are now used only for grazing. The main body of the crofts (nos. 3 - 13) face south - they are more compact than those in Valtos and Reef, but they vary in size from 2.9 to 13.25 acres and their boundaries are irregular in shape. Two crofts (14 and 15) are separated from the main parts of Reef: they are both small (2.5 acres) but the size is compensated by their situation on the level terrain of the machair. The old farm house
241 is used as the dwelling for both 14 and 15. Much of the cultivation at Reef, except on the
407 machair crofts, is on lazy beds - but many of these have decayed with the advent of horse and tractor ploughing; 35% of the land is cultivated by spade, and the remainder by horse plough.

The crofting economy is probably at its lowest ebb in Reef. Only eight of the fifteen
433 crofts are occupied and of these five are worked by disabled crofters or crofters over
729 sixty-five. The Reef crofts were settled in 1921 by returning ex-servicemen and today seven are being worked by the original settlers; there is little evidence of a desire among the younger generation to succeed to the crofts.

233 Until 1956, crofters on Reef used to graze both sheep and young cattle on the Flannan Islands, fifteen miles west of Uig.

162 Fig. 24 shows the age/sex structure of the population in the three townships. It tells a story familiar to crofting townships: 55% of the resident population are over forty-five years of age; 9% of the total population are permanently away; and since 1939 the population has declined by at least 15% as the result of emigration alone. But perhaps the
163 most significant fact is the very small proportion of women of a child-bearing age and the consequence that only three children are being born each year to replace the older generations.

131 By their very position, the townships of the Valtos peninsula are isolated. Fifty years
20 ago communication with the rest of Lewis was by boat. The road to Valtos and Kneep was built originally to bring the mails from the pier at Meavaig; the motor road to Reef was completed in 1956. Shopping facilities are provided at Valtos, for the people at
443 Valtos and Kneep, and at Meavaig which serves Reef, Uigean and Cliff. These are supplemented by travelling shops which call once per week, by Indian dealers and by the local 'bus-driver who makes purchases in Stornoway on behalf of customers on the
346 peninsula. The school for the whole area is situated mid-way between Cliff and Valtos and two kirks and the doctor's house lie at the junction of the Valtos and Reef roads.

/facing p. 48/

427 joint tenants of one have moved to Geshader while continuing to work the Ungshader land.
632 Another is preparing to move to Enaclete and yet another lives on a feu at Loch Chroistean
311 Cottage. At present, three working units remain. Enaclete consists of nine crofts with ten units, one being rented by joint tenants.

221 The rhythm of work is similar to that in other parts of western Uig. Potatoes and oats are planted in April followed by lambing and peat cutting in May. In June and July the sheep are shorn and subsequently sent to the common grazings. In August the peats are carted, once they are dry, by lorry direct to the crofts. Hay-making follows. The lambs are weaned in September, harvest is then carried in and tupping and statutory dipping take place in November. The sheep are then returned to the township grazing though the lambs
241 may be fed with hay on the croft. There is little regular crop rotation and only a small number of crofters seem to undersow oats, thus improving the quality of future hay crops. Gardens are not important and only provide for family needs but Caryshader particularly has a number, some growing flowers as well as vegetables. Fertilisers vary widely from croft to croft as well township to township. Enaclete potatoes are still grown near the shor and thrive on seaweed; those of Caryshader are usually fed on artificials.

231 Most crofters keep one milk cow with a calf; a few rear a young beast for the autumn sales in Caryshader. However, some now rely on their neighbours for milk in return for grazing and one croft has turned to goats, as giving less trouble. The bull for the whole district is a beef shorthorn and is kept on Geshader - Ungshader common grazing as it is completely fenced; and Geshader is responsible for its upkeep.

233 Lambing seems to have been generally good in 1959 but it was not easy to get exact figures. The Morsgail Estate and Gisla farm also run considerable flocks. The common pastures total 3,119 acres with an enlargement, formerly used as shielings, of 1,215 acres for Enaclete, Geshader and Ungshader near Loch Suainaval, and for Caryshader 88 acres
344 on Floday island. The shielings have been disused since the war. Peat is normally cut to the west of the road but at least one elderly tenant in Geshader has kept a section of his croft for this purpose to save the effort of working further afield.

241 Generally speaking the land now cropped only represents one third to one half of that
178 worked by spade 20 - 50 years ago when the crofting population was larger and when much greater numbers of cattle were kept through the winter, thus requiring more potatoes and
231 more oats. The cattle numbers are much less than the total souming but sheep are in excess. In Enaclete, at least, overgrazing by sheep has caused a decline in grazing quality

464 Clearly in these townships, apart from the very few crofts still fully cultivated, the means of livelihood is sought elsewhere. At present there are altogether fifty-three men in the working age group (15 - 64) in all four townships. Of these fourteen are away, nine permanently and five periodically. Thirty have regular or periodic employment besides crofting and of these seven work at Gisla on the hydro-electric scheme, seven weave, some of them part-time, four hire out vans, two do post-office work and others have varied occupations while only three are full-time crofters. At present there are few men in the Merch Navy and fishing does not provide an occupation although many share rowing-boats in their spare time, and fish for domestic use.

162 The population as a whole is ageing and of the group between 15 and 64, forty-four
166 (roughly 30%) work away permanently or have emigrated. It is noticeable that there are few crofts worked by people with young families

000 In conclusion it may be re-emphasised that the fate of the crofting townships depends m

Problems of communication are not, however, solved merely by providing better roads: at least one household in four has a car or van, and this, with the fall in population, has caused a fatal decline in the use of public transport. The Bernera bus service was discontinued in August, 1959, for lack of demand. This is not, of course, an isolated example: the problem is common to all the Highlands, and indeed, to all the rural areas of Britain: in Sutherland, for example, the number of registrations of private cars has risen to very nearly 250% since 1945, and the total number of registrations for all classes of vehicles up to 1938 had risen to almost 200%, while the number of hackney carriages, after reaching a peak in 1952, has since declined by 70%.

Note: in this table, "working units" include all crofts, whether stocked or not, and all other agricultural holdings. Two or more crofts worked together, whether registered under the same tenant or not, are counted as single working units. An agricultural holding is defined as one with at least one cow, or five sheep, or half an acre of cultivation.

ON
XT FICHE

The Agricultural Year in the Carloway District.

Month	General	Land	Cattle	Sheep
January and February	Preparation of land. Ditching.		In byres - out on fine days.	On crofts and inner common pasture.
March		Ploughing and manuring.	On crofts and inner common pasture.	PAKE - clipping. Put on outer common pasture.
April	Peat cutting.	Sowing oats. Sowing potatoes.	Sales.	
May	Lifting peat.	Cleaning potatoes.		
June	Peat taken to roads.	Cultivating.		
July	Little croft work until late in July or early August.	Hay cutting and drying.		
August	Bringing home peat.	Oats cut and dried.		PAKES - for shearing and weaning.
September		Grain and hay brought to stack enclosure and byre.	Sales.	
October		Lifting the potatoes.	Cattle brought into byres.	Brought to crofts and inner common pasture. Dipping and tupping.
November and December	Little croft work.		Feeding in byres; outside when possible.	

Figure 40.

/p. 108/

241 Oats are the main fodder crop and although the practice of undersowing is not familiar it is increasing with the incentive of cultivation grants. Potatoes are the other major crop, the main crop being Kerr's Pink and the Valiant are several varieties. Domestic gardens, common to nearly all the crofts, grow cabbages and carrots. Turnips only succeed occasionally and there were many reports of poor yields. Two crofters had grown sugar beet successfully for fodder but did not see much future for it.

Sown grasses are being used increasingly and several areas of varied quality were noticed ranging from an indifferent field of Italian rye grass that had been down for five years to mixtures recommended by the Agricultural Advisor. These mixtures are used in rotations thus:- oats - potatoes - oats - sown grass - sown grass.
Some surface reseeding has been attempted and has succeeded on the crofts but none has yet been tried upon the common pasture, which is shared with Park Carloway. The chief problem has been that of finding a suitable area readily accessible to all the crofts. With the example of Breasaiete and some of the townships in Ness in mind all agree that reseeding would be beneficial.*

Fertilisers are used on all the crofts and a clear pattern of their use emerged. With the obvious exception of dung the traditional types of fertiliser have been abandoned.
Only one person uses shell sand in preference to lime for normal crops. For surface reseeding sand is obtained from the north west coast though transport costs are high.
Good reports were given of regular liming, the only dissenter significantly having his croft by the river. Seaweed is sold now in use though there were good reports of its value; labour, to obtain it was not available. With the incentive of the cultivation grants
159 there is a regular application of blended artificial fertilisers by the majority of holders.

The Carloway hill common has not been cultivated within living memory but the cultivation of every possible piece of croft land was remembered by many. Several crofters recalled the period before the First World War when all cultivation was bazapade
233 alone. The abandonment of the shielings some forty years ago reflects the decrease in cattle stocks; the smaller the numbers of cattle the less important is it to obtain additional grazing during the summer so that the croft land may recover from the winter and spring grazing. All that remains of the shielings are small, almost circular, mounds
178 of stones surrounded by a green sward. The decrease in cattle stocks, then three times larger than now, and the primitive life of the shielings are probably the chief reasons for their demise.

A comparison of the percentages of the scoming taken up reveals this decline in cattle and the relative and absolute increase in sheep stocks. On six of the forty one units on the crofts the total scoming is exceeded, one is at par and the rest are understocked. The sheep figures show a slightly different situation; eight of the forty one are exceeding their scoming, two are at par and the rest are below, but not far below, if sheep are kept at the 'par' level, whereas only six of the fifty six total units have no cattle, twenty three are without sheep (14 crofts and 9 feus). For an analysis of the statistics for the whole area see tables I, II, & III. The most interesting feature of the comparative figures is the 'par' figure for sheep, for in spite of the fact that Park Carloway has an excess of sheep, the joint figures do not exceed the total joint scoming for the townships.

CARLOWAY PARK

361 In contrast with the excessive elongation of the crofts in Upper Carloway those of
427 Park Carloway form compact blocks. Another unusual feature is that when the crofts were listed five field drains per croft were laid at a depth of eighteen inches; this may have something to do with the good quality of the land. Nineteen acres of croft land is now in 1960 and 1962 172 acres of common pasture were reseeded.

361 is attached to the Free Church Manse, is sublet to two feuars and is used entirely for
427 hay. One remarkably well stocked croft has one horse, two cows in milk, one calf and a heifer together with a sheep stock of twenty breeding ewes, twenty lambs and twenty other sheep (this was the first 100% lambing for many years). Labour is provided by one full time crofter with assistance from two others one of whom is a weaver. On another croft an elderly lady was preparing to make an application for a cultivation grant.

241 The intensity of cultivation may be attributed to two factors; first the sheltered position
427 of the land, the moderate slope and good drainage and second to the energy and enterprise of the crofters.

BORROWSTON

361 Borrowston exhibits many of the characteristics that have been noted in Upper Carloway
427 and which are common on the north west of Loch Carloway. It consists of sixteen regimented crofts and there are no feus. The crofts were listed in narrow strips which rise steeply from the western shore of Loch Carloway to a head dyke at about 200 feet O.D. The croft tower (bins as the ground rises and so upper ones with exposures of bare rock is reached. The result is that most of the cultivation takes place below the road which passes through the croft land and along which the settlement is located. All the crofts are fenced below the road, but are only partly fenced above it, presenting a pattern similar to that at Upper Carloway. Because of the steepness of the crofts the only way that the tractor can gain access to the land is by way of the lower road which passes from the bridge to the pier.

241 Fifty four acres of crofland are worked in fourteen operative units on which the oats
427 are cultivated by tractor and the potatoes by spade. Though all the crofts have immediate access to the sheep zones are fertilised and reseeded at the present time; following the common practice in the area artificial fertilisers are used to supplement lime and manure
233 from the sheep. None of the crofts are open for common grazing in the winter; this is because of the use of the old farm of Laimishadar, granted to the township as an enlargement. The former arable land is now used as additional common pasture. The normal
178 practice is to use the former farm land in conjunction with the croft land in the summer, the cattle being maintained on Laimishadar as late in the season as is possible.

241 Borrowston is intensively cultivated, presenting a prosperous picture when viewed
427 from the opposite shore of the loch, but in spite of its apparent prosperity the majority
162 of the population is over 45 years of age. Herein lies one of the main causes of concern
181 in this part of Uig parish, for though Carloway is in many ways more prosperous than its south Uig and has a larger and more active population working in much more favourable
167 conditions, the population is an aging one that has not the potential for maintaining a level of replacement. In Borrowston eight of the crofters depend on weaving, four are full-time crofters and seven of the twelve are over sixty five. Yet these men are active and maintain large sheep stocks, ten of the twelve exceeding their scoming though only one of them has an excess of cattle.

Figure 41 has been drawn to illustrate the land use on particular crofts in this
233 northwestern area; one is in Borrowston and one is in Upper Carloway. The stock data
427 have also been added to give the complete picture of the agricultural unit. Each croft is though peasant, an elderly tenant.

361 GARENIN
427 The township of Garenin, whose main area of crofland is situated a little apart from

[TEXT CONTINUED ON PAGE 107]

1. [Presumably the author means figure 41--Ajmlyst]

Figure 41.

Figure 42.

241 permanent grass. The pre-eminence of the Carloway area is then only a relative one
178 where the decline in cultivation is taking place at a slower rate. Isolation, the decline in fishing and the lack of alternative employment leading to a greater decline in population may explain the more rapid decline in the Valtos area. Whether Carloway will see a similar decline remains to be seen.

Table 35

Stock carried as a proportion of total scoum of each township - Carloway district.

August 1959

TOWNSHIP	All Stock	Cattle	Sheep*
Carloway	63%	53%	70%
Carloway Park	87%	64%	119%
Borrowston	76%	15%	121%
Garenin	95%	70%	98%
Knock Carloway	64%	30%	90%
Kirivick	73%	25%	124%
Dun Carloway	104%	21%	187%

* As recorded in some cases these figures are too low (see Appendix C (2)); the maximum error is probably around 10%.

233 Table 35 summarises the agricultural system; further details of the relations between
178 units of unit, status of tenant, stock of cultivation, will be found in Appendix C (3), (4), (5)
233 and (6). Though the total scoumings (that is the conversion of both cattle and sheep units
178 to 'cow units' expressed as a percentage of the scouming) never fall below 60% the total scouming is exceeded in five townships and that grossly in two cases. Once again broken
241 this is not as serious as it is in the Valtos area where scumings are exceeded by up to three times the figure allowed. Nor does the mere statistical analysis reveal all the picture for it is essential that a proportionate number of cattle be kept so that the grazing of both cattle and sheep may regulate the growth of the grass. As it is, the relative and absolute increase in the numbers of sheep is having a serious effect on the quality of the pastures.

Sheep are given less attention that the cattle whether they need it or not and few of the present generation are prepared to tolerate the life of a shieling in the old fashion when the cattle were taken in the summer. In consequence the grazing on the outer moor is almost entirely given up to sheep. The shielings are now only marked by small broken stone mounds which were once the shelters and by the small surrounding areas of greener sward. The changing aspect of the hill landscape has already been mentioned.

233 Comparison of the totals given in Appendix C (1) shows how the present pattern is develo-
178 ping. 167 milk cows are being raised on 171 agricultural units and with these are 113 calves. Appendices C (1) and C (6) indicate that the agricultural unit farming the basis of farming is the single milk cow and annual calf which carries a subsidy if it passes the inspector of the Department of Agriculture. A few crofters are raising young beasts for sale but there is a general unwillingness to grow more fodder to raise cattle for an uncertain market which may be affected at any moment by an increase in transport costs which are already high. Without the subsidy such enterprises would hardly be possible at all and indeed one could say this of many aspects of life in the island today. Some of the calves are weaned, but the usual practice is to sell off late in the year.

233 Little close attention is paid to shepherding though several crofters profess to lifting it. The great losses on the moor (often amounting to one third of the lambs each year) does not seem to cause much worry. The chief income from the sheep is the fleece which sells at up to 4/- per pound, an average fleece weighing from three to four pounds. This wool is not used for the tweed industry since it is too coarse being more suited to carpet manufacture. Appendix C (b) shows that the majority of flocks are small averaging from 10-20. The overgrazing is the result of a smaller number of owners keeping larger flocks. Thirteen of the working units have between 50 and 100 sheep. As to those without sheep, several crofters declared themselves to be too old to bother with them, a fact which serves as an illustration and introduction to the population problems.

Appendices D (1) shows the twofold nature of the difficulties which confront the community. Twenty-two per cent of the residents are over 65 years of age and no less than 56% are over 45 years old. With the sole exception of one man who works on the power development project at Gisla in South Uig, the main focus of employment is local. A small number of people are engaged in services to the community including shopkeeping, but the main source of income is weaving since crofting itself (by definition in this area at least) does not yield sufficient to maintain a family. Yet there are 31 full time crofters who are being supported in some other way, either by relations temporarily or permanently absent or by interest on capital accumulated during periods of employment away from the island.

There is an insufficiency of women of child-bearing age to offer hope of an increase in the population or even a sufficient number to guarantee a level of replacement. This fact together with the emphasis on one form of employment gives rise to anxiety among the crofters, who recollect what happened when the fishing finally collapsed during the First World War after a period of steady decline. In 1913 twenty boats sailed from Carloway and gave employment to 295 men. If the weaving fails (at present a weaver making three tweeds per week can earn up to £16 for them) there will be similar hardship and the net emigration from an area already some too attractive to young people will certainly become more marked than it is at present.

Table 36

Fishing in the Carloway District 1892-1956

	Boats	Numbers engaged: Men	Boys	Value of catch:
1892	65	300		?
1900	27	318		?
1913	20	295		£8,700
1920	14	266		£560
1930	10	83		£262
1938	10	40		£470
1948	14	40		£174
1956	15	18		nil

not have crofter status. Then, despite the rigidity imposed by crofting legislation, the rating structure is evolving) whether the larger units so formed are agriculturally more productive than the smaller, statutory, units is another question.

Cattle and sheep stocks

The production of cattle and sheep is the main function of the croft, from the agricultural point of view, and the main function of the crofting parish. In this respect a great change has occurred in the last 80 years: about 1880 some 3,300 cattle and 14,000 sheep (of all ages) were kept: in 1959 the corresponding figures were 1,281 and 35,000. This change is by no means the result of the re-settlement of crofters on farms (formerly farms) in 1879, according to the Report of the Royal Commission on Agriculture, for the parish contains, in 1959, 2,31 on the crofting townships and 9,61 on the farms: now if the sheepcattle ratio was 2,31 on the crofting townships, it was then fairly uniform over the parish except that, whereas sheep outnumber cattle by more than two to one today, in Carloway District they have little more than doubled.

The decline of cattle numbers has been at the same rate as that of the human population and this, together with the much lower sheepcattle ratio on crofting townships than on farms in 1879, suggests that, 80 years ago just as to-day, the main object of cattle keeping was subsistence rather than commerce. The increase in sheep numbers on the other hand is probably no more than a reflection of increasing disregard of the sownings.

If we compare the cattle and sheep stocks with the sownings shown in Table 38 and Appendix E we find that 80 years ago, except in Barvas, there was rough agreement between stock and sown. To-day cattle stocks are around one-third of those allowed by the sown whereas sheep stocks are greatly in excess. Examination of the sownings leads one to question their validity in the light of modern conditions: the sheep sowns bear no regular relation to the available areas of common pastures (Appendices A(i) and

TABLE 39

Stock carried by working units

STOCK HELD AS PROPORTION OF SOWN	Percentage of units in each district with stock indicated: South Uig	Barvas	East Loch Roag	Carloway	WHOLE PARISH

All units	100	100	100	100	100 (499)

(2) and the cattle sowns appear impossibly high unless large quantities of winter fodder are imported. In the old townships the sowns of each croft are still based on minor variants of the traditional "1 cow and follower and 8 sheep per pound rent", the rents, however, were calculated on the potential value of the croft in days when an inexhaustible supply of labour was available for production of winter fodder by cultivation. This is no longer the case and the old assumption no longer holds.

Township pastures are seldom, if ever, used to best advantage. Because the regulations generally allow unlimited substitution of sheep for cattle, the sownings are not, in theory, exceeded by the presence of the increased flocks of sheep. In practice, however, the situation is quite different. In the first place the difference between the effects of the grazing of sheep and cattle on the hills is not widely appreciated. In discussions some crofters remarked on the change during the present century in the appearance of the nearer hill pastures - "they were green when I was a boy, now they are black". - but this was seldom correlated with the decline in cattle and increase in sheep. There can be no doubt that the increase in the ratio of sheep to cattle has generally led to a deterioration of the grazings. Further, there are almost five hundred separate sheep packs on the parish pastures, most of them with less than 20 ewes; at some banks the men and dogs seem to outnumber the sheep! Little real sheep-herding is done - nor can it be by men who have other regular employment. Conversely the hills are not grazed evenly: some areas are grossly over-grazed whilst others are neglected. This situation has grown worse with the decline in cattle numbers and consequent abandonment of the shielings, the occupation of which ensured that use was made of the more distant pastures.

Yet another factor inhibiting proper use of township pastures is their situation and shape. Many townships, particularly in South Uig, have detached areas of hill pasture, former shielings. These are often singularly inaccessible now that the custom of staying at shielings has ceased. Other township pastures are long narrow strips running inland for up to seven miles. Herding from one township's lands to those of another is therefore common. Individual allocation of the hill pastures is not practicable but a certain amount of fencing and, possibly, the employment of a paid township shepherd (as in the nineteenth century), would help.

If we examine the stocking of individual working units, Table 39, we find that only 30% carry more than their total sowns, 35% carry between a half and a full sown and a further 35% carry less than half their sowns. The situation does not vary very much as between the four districts, although there appears to be a slight tendency for working units in

TABLE 40

Barvas and South Uig to carry more stock than those in East Loch Roag and Carloway. Taking the total sown (cattle and sheep together) obscures some aspects of the livestock economy. If we examine cattle and sheep separately quite a different picture emerges (Table 40). As to cattle over one year old, two-thirds of the units carry but one cow, 18% have none, and only 3% carry two or more. In all districts the majority of units carry but one cow, but in South Uig and Barvas a significant proportion carry two - either a milk cow or a young beast, the latter presumably for sale in the autumn. Clearly, the great majority keep a cow mainly as a walking dairy: experience in other areas confirms this and in the Point and Tolsta district where the majority of crofts have ceased to keep cattle at all since organised milk supplied became available. Sheep stocks, on the other hand, vary far more from unit to unit (Table 40). There is a marked tendency for the flocks to be bigger in the south and Barvas districts, where units without sheep are also rare, whereas in the north a quarter of the units in the Carloway district are without sheep and few have more than 50. In other words, agricultural production per working unit is greater in the two southern districts than in the north.

The management of the 500 or more sheep flocks deserves some comment, even from the non-agriculturalist. Lambing takes place in April on the crofts or on nearby common land: the ewes, with lambs, go to the hills in May, weaning takes place at the end of August and at the end of October or early November all sheep return to the croft land or near-by common pastures. The lambing percentages (60% - 70%, see appendices A(i) and C(ii)) as reported is so appear optimistic, even for a good year, but this is probably because they were given to us before weaning: at least a 10% reduction of the figures given would be realistic. Except for certain South Uig flocks few lambs are sold; the

ewes are needed to maintain the flock because casualties, from diseases and accident, are heavy. Wedders are also kept, until they are two or three years old, when those that survive are supposed to be good for the pot. Again, after allowing for casualties and home consumption, the price for sale is generally small, except from a few exceptionally well-managed flocks. Likewise, the crofter who weeds out his elderly ewes is almost unknown; one man, however, claimed with pride the possession of a fifteen year old ewe! Thus it is certain that, after allowing for household consumption, very few of the little flocks of sheep yield an economic return for the time spent on them. The ideal arrangement would be to replace the 500 little individual flocks by about 50 commonally owned "slab-stocks", each with a paid shepherd. This could almost certainly be financially more rewarding but would probably be socially unacceptable because so many crofters are deeply attached to their small packs of sheep.

Table 41 has been constructed in an effort to discover whether the size of the working unit (which is greater in the southern districts) has any notable effect on stock carried. Further details will be found in appendices A(i) and C(i). It is clear that the size of the unit has no influence on the stock carried.

Finally, we may examine the stock held according to the age and employment status of croft workers (Table 42). Apart from a natural tendency for persons over 65 to have no stock, the status of the croft worker appears to have little effect. Whether a croft is worked by a full time crofter, or only casual employment does not appear to influence the amount of stock which he carries. The proportion of croft workers under 65 with no other employment carrying no stock may seem curiously high until we recall that many of these persons are elderly pensioners or invalids.

TABLE 41

Stock carried (as a proportion of sown) according to size of unit

	Percentage of Units according to sizes: 0-2.5 acres	2.6-5.0 acres	5.1-7.5 acres	7.6-10.0 acres	10.1-15.0 acres	15.1-20.0 acres	more than 20.0 acres

CONTINUED FROM PRECEDING FICHE

Stock Management.

22/ 239 178 The annual rhythm of stock keeping has lost the clear definition it used to some extent to possess. The decline in summer residence at shielings has already been mentioned: most were in use up to 1914, and many were visited after the Great War, but the decline continued during the inter-war period until practically the last visits were made between 1936 (Lundale) and 1939 (Tobson): very few shielings have been visited since. There are one or two isolated examples of a summer visit to the pastures still surviving, but [476] they are not carried out by regular crofters having normal grazing rights. The construction, since 1908, of ring fences around the inbye and the more recent fencing of certain common grazings has further lessened the necessity of herding and co-operating regularly on the commons. The importance of fencing may be judged by the fact that it was estimated that, whereas prior to the construction of the fence there were about 4,000 sheep grazing over the Earshader - Crulivig - Lundale area, including about 2,000 from the Bernera Shielings and about 200 from Uig, there are now only about 1,500. Figure 30 indicates both the periods when the sheep are on the hills and the variation in the dates of movement. This applies mainly to the Island townships, for mainland townships which are contiguous with the grazings, may keep sheep on the hill for as long as six months each year. The rest of the year is spent on the township pasture and inbye. Hacklete, Kirkibost and all but seven of the Tobson crofts are open in the winter to common grazing. When the custom was more widespread the dates were clearly stated and adhered to, now there is more variation, and November 7th or 14th (Hacklete) or 17th (Kirkibost) have become indications rather than rules, depending on weather and the lifting of crops. On the mainland, ('Bernera Shore') the sheep may be brought merely nearer to the crofts rather than right onto the arable; where fences have been constructed separating off an area of common grazing next the head dyke of the township, as at Earshader (1908)*, Crulivig (1908, and 1939), and Lundale, this practice may be formalised, so that only certain classes of sheep are ever taken on the croft. The movement from the croft to the hills is governed mainly by the weather: the eild sheep will be sent off to the hills some time in April if at all possible, and the ewes in lamb often thereupon taken into the inbye if they are not there already. During May, when lambing is safely accomplished, the beasts able to support themselves and when the weather is suitable, the ewes with lambs are sent to the hill.

There are some places with special practices, notably Little Bernera which is closed to grazing in July, August and September. Similarly each holding may graze a certain proportion of replacement hoggs upon the township common grazing of Breaclete while the other stock is on the hill: this may formerly have been a more widespread custom: it certainly has contemporary parallel in Kirkibost where some sheep remain on the township common pasture to compensate for the much reduced numbers of cattle grazing there in summer.

The individual crofter, or two or more in co-operation, keeps tups buying a new beast from a different source every three years, unlike Sutherland where it is almost universal to hire them. These are usually tethered upon the croft from August until tupping in December. This again takes place on the croft (compare Sutherland, where, since the tups are generally hired by the township, the tupping is usually done upon the hill and often entails a good deal of herding). The ewes are not generally hand fed except in emergency, though here, as in all other crofting areas, opinion is divided on the advisable extent of this practice. It is however, more general to hand feed the hoggs which, indeed, may be kept under-cover at night in the worst weather, even though they are on the croft [132] or (Bernera Shore) on the nearer common grazing during the day. It is clear, though, that, in spite of the occasional hard weather, there is not generally the amount of snow and frost in winter to cause that amount of hand feeding and care which is a necessity in many parts of the mainland Highlands.

*Since 1950 about 120 acres have been divided in four and individually fenced.

221 233 Since so much of the year is spent either upon or near the crofts it is but to be expected that greatest losses of Island sheep will take place in the summer when they are far from supervision upon the hills; this contrasts with the mainland Highlands where heaviest losses, apart from those due to sudden snow falls, generally come about lambing time, when this takes place upon the hill, or soon after, in cases when the ewes and lambs are put to the hill too soon. On Bernera Shore on the other hand losses are heaviest on the hill in winter. Losses are extremely uneven in their incidence in time and from croft to croft. The cause of loss varies: there are no serious endemic diseases now, and there are few coastal cliffs - a frequent cause of loss in other places. There are however some boggy areas in the interior and some rugged: whether or not there are losses due to vermin particularly eagles, is a debatable point. Probably the fundamental cause of loss is lack of shepherding and adequate day-to-day oversight upon the hill.

233 There are certain special pastures that show interesting features. The Flannan Islands have excellent pasture, especially for the poorer male shearlings which need bringing on. There is all-the-year-round grazing for fifty sheep, which is shared by two crofters in Crulivig and one in Earshader. Unfortunately, the difficulty of getting a boat to go across has meant that for the last two years no visits have been made, and, after one or two years unattended, the animals become quite wild. Since 1949, when the Croir tenants were first permitted to cut peat upon the Bernera shielings, they have ceased to do so on Vacasay Island, where they now each send two sheep for summer grazing. They also send one sheep each to Euglam Island from 15th May to 16th August. One croft in Tobson includes certain small islands:

Bearsay Island (16.4 acres; soumed for 12 sheep per annum)

Eilean Fir Crothair (4.6 acres; soumed for 5 sheep per annum)

Seildeim (1.0 acres; soumed for 3 wedders per summer)

Similarly, Valasay (part of Tobson), has Eilean Liongain Valasay which provides summer pasture for two young cattle beasts or five sheep (one per croft). One crofter in Crulivig has a small offshore island taking two hoggs during tupping and at least one crofter in Crulivig also grazing on Ben Sgurain, but there has been no success in the attempts to heft stock there. It is distant and unfenced; losses can be heavy.

231 Lewis is a very restricted market for livestock: the general practice in the Bernera area is to sell cast ewes at five or six or even more years to the butchers in Stornoway. Lambs may be sold on occasion, but generally they are kept either for replacement or for sale as three-year wedders.* The losses which occur, plus a certain amount of slaughter for domestic use, prevent long-term accumulation, though periodic fluctuations may be severe. Occasionally when there is a surplus of summer grazing, the Bernera Shore townships may buy in lambs from the western coast of Lewis, carefully eschewing those raised on the machair lands, which are said to be too "soft" for the hills. These are reckoned a gamble, they may or may not "take". The practice may be compared with that of the former Linshader Farm where, to take up the summer surplus of feed, young cattle were bought from the crofters.

236 [Zeep] [434] The wool from the Lewis Blackface sheep generally varies from three to four lbs. per fleece. There is no longer any hand spinning; most wool is either sold outright or sent to the mills for spinning and dyeing. This practice is of long-standing. Even before the Great War, when the rent formed by far the most important item in the monetary affairs of the croft, the wool was either sold outright or, more commonly, sent to the mills for spinning and then taken to a weaver; the tweed was then sold either locally or to a merchant in Stornoway, the proceeds being used for the rent and other items.

231 178 Cattle, as has been pointed out, have declined greatly in relative importance since 1883: they are fewer in number - though far better in quality - and consequently subject

[432] *Three-year wedders in good condition fetch about £6 for slaughter. Carcase weight is about 44/45 lbs., sometimes as little as 38 and sometimes as much as 55 lbs.

1881	596	1951	384
1891	535	1959	311
1901	580		

231 There is no bull in Garynahine; the Department of Agriculture bull from Callanish is borrowed. Most crofters buy their milk either from the Admiral at the Lodge or from Stornoway whence a dairy delivers daily.

Eight crofters keep sheep; stocks vary between 5 and 30 per holding. Two crofters
● 233 exceed their souming (there is no equivalence in Garynahine because there has always been plenty of pasture). With a total of only 146 sheep and lambs on 1800 acres common pasture there is no danger of over-grazing.

312 The village has a good piped water supply from Loch Mhurchaidh, and has had elec-
311 tricity since 1954. There are excellent communications: 4 buses a day to Stornoway
414 and also one bus from Uig and one from Bernera passing through Garynahine. These good communications have probably contributed to the declining interest in crofting.

463 There are only three full-time crofters (two of whom draw war pensions). Of the remaining 12 adult men permanently resident, 10 have regular or part time work, the remaining two being to old. Employment is either in Stornoway or at the Lodge. Only
[178] two people do part time weaving. Crofting is rapidly decaying in Garynahine. The croft land is reverting to rough grazing, and there is no indication of renewed interest in the land. Instead, life is becoming increasingly orientated towards Stornoway.

CALLANISH by Anne Iredale and Jennifer Oxenbury

172 Callanish must be one of the original settlement sites of the Hebrides, as it boasts an impressive standing stone circle and two other groups of stones. The stone circle
133 is on a promontory, which projects into East Loch Roag. The promontory rises to about 125 ft, and then the land drops almost to sea-level at the neck (less than half a mile wide) which joins the promontory to the mainland. The township extends inland for about six
[361] miles in a belt roughly two miles wide. This inland area forms the common grazing; it is rough hummocky moorland with the general height rising gradually inland; the highest point is 425 ft.

195 The early crofts were situated close to the stone circle overlooking the Loch. The area was given to crofters who had been cleared from Linshader in the eighteenth century,
427 and it is said that until the Crofter's Act the Callanish crofters had to return to Linshader to work for one day a year in return for this grant of land. But later the crofts on the
361 more exposed westward facing side of the promontory were cleared and replaced by the 90 acre Callanish Farm. Some ruins of the croft houses still remain. The crofts then spread across the low lying neck to the main road from Stornoway to Breasclete, which
241 now forms the boundary between the croftland and the common pasture. The croftland varies in quality, but it is mainly quite good potential arable. Fertiliser and manure are extensively used. Seaweed was widely used in the past but in more recent years the labour of gathering the seaweed has been out-balanced by the lower price of the artificial fertiliser. The main problem of the crofters is one of drainage, and in some parts the drainage channels have to be as wide as the strips of cultivation. Croft 29, situated on a small peninsula from the neck of low lying land, is almost cut off from the mainland at high tide.

175 The croft houses were then in two nuclei; one on each side of the narrow neck. Much later a third nuclei developed, known as Callanish New Park, further north along the
361 Stornoway road, formed by evicted crofters from Bernera; they had put to sea in small boats with their belongings, and they happened to land at this point. They first became
427 squatters on the common grazing but later gained crofter status.

There are 47 crofts in Callanish which vary in size from 2 acres to 9.7 acres. Some
427 of the larger crofts are a result of private enterprise; the crofters have, without any
311

[TEXT CONTINUED ON PAGE 89]

427 authority, simply moved their fences and enclosed part of the common grazing. For
311 example the crofter at 37, instead of having only the 6.7 acres of the croft has now almost 10 acres of land, of which the remaining 3 acres have been 'acquired' by enclosing part of
195 the adjacent common pasture. Some of the crofts are in two or three pieces, and in some
311 cases this came about in the late nineteenth century when the proprietor's wife, Lady Matheson objected to the position of some of the croft houses because they were too close
427 to the standing stones. Croft houses 25 and 26, then near the stones, were moved to the other side of the village and given parts of crofts 1 and 2 for their houses. Crofts 1 and 2 were given parts of crofts 25 and 26 as compensation for the parts of their crofts they had lost. Croft 27 also lost part of its croftland close to the stones so that an enclosure could be made around the stones. About the same period, before the passing of the Crofter's Act (1886), when the village was still 'ruled' by the township constable, and several other changes took place. Croft 27 and 28 used to be where the croft houses are at present and the surrounding adjacent area only; but it is said that the tenants of these two houses, being influential with the constable, obtained part of Callanish Farm. Similarly the tenants of crofts 30, 31 and 35 divided part of croft 19; these changes have become permanent. The most recently formed croft was taken from the common pasture in 1890. Since then three feus have been created, but two of these are holiday houses and the third has only 0.5 acres of land.

241 There are 36 working croft units with a total of 134.4 acres reputed arable. All but 4 croft units grow oats, and there are 20 acres under oats (appendix C). Of the remaining cultivated land 9 acres are potatoes and 5 acres sown hay. Most of the land is cultivated by tractor; there are 6 tractors in the township. In the past there were several horses but now there is only one. Five crofters still cultivate by spade. The crops are sown in April, and the hay is usually harvested in August and the oats a month later according to the weather.

231 Thirty-one cows, six heifers and 25 calves are kept in the township and tethered most of the year on the crofts. It is usual for the crofters without a cow to graze one of their neighbour's cows for part of the year in exchange for milk. There is a beef-type short-horn bull belonging to the Department of Agriculture, which is kept on Callanish Farm.

233 The 5,302 acres of common pasture support an individually owned stock of 904 sheep
● 311 and 561 lambs. Several crofters exceed their souming, but there is no shortage of grazing. Some of the sheep graze on Garynahine township pasture. Callanish also has the use of the pasture on Orasay island; each year some of the sheep (one sheep or ram
221 per croft) are taken across by boat for a period. The breeding ewes are brought in for
233 tupping on November 14th, after the harvest is complete, and lambing takes place in April. The crofters open their gates for winter grazing from November 1st to May 10th; in addition Callanish Farm (which has no sheep) is open for winter grazing. The sheep are sheared in July, and the lambs are taken from the ewes a month later. The lambs are dipped in November and the other sheep in December. Shielings at Flodavat are known to have been in use until 1921.

491 Communications are quite good; the village is close to a main road to Stornoway, and
131 there are four buses a day. But within the village itself many of the so-called roads are merely rough tracks, and one croft, number 29, is inaccessible by motor vehicle; it is
[194] over a mile from the nearest track, separated from it by rough peat land. This year a grant from the council was made towards the cost of construction of a road to this croft; but several of the Callanish crofters who cut peat on the intervening land refused to allow a road to be built; and so croft 29 is still almost cut off from the rest of the village.
131 There are two shops in Callanish (one with a petrol pump); grocery, butchers' and fish
[366] vans deliver frequently. Callanish also has a stone jetty which in the past was important. There was a ferry for mail and passengers from here across to Uig and Bernera calling
[504] at Linshader, which gradually declined in importance until the 1920s when it ceased to call at Linshader. The ferry to Bernera finally ceased in 1940 when the ferryman (who
[505] lived at Callanish Farm) left for war service. After this the jetty was still used by small private boats (e.g. Callanish church serves Linshader, and many people came to church by boat until recently), but gradually it has fallen into disuse.

Shielings were still used to some extent up to 1938. Now it is fewer cows are kept than formerly. With the reduction in number pastures close to the village are being colonised by heather.

221 The crofters' year begins at the end of March when the ditches
241 land is prepared. In April the ground is ploughed, fertilised and

way. Since 1939,

241 are usually all the potatoes. Between the road and Loch a' Bhaile and between the unmade road and Loch Shader on crofts 22 to 25 the land is probably more intensively cultivated than ever before, but strips now overgrown with rushes and coarse grasses, especially near the cemetery give an idea of the former extent of cultivation. The working of strips nearer the sea is no longer worth the labour involved. Crofts 22 to 25 are further divided by the small Loch Shader; no. 28 however makes good use of a small alluvial flat at the head of Loch a' Bhaile.

[237] Artificial fertilisers are in general use together with lime and dung. However some crofts were using seaweed, in particular nos. 1A, 1B, 1C, 4, 5, and 25 - i.e. those crofts with easiest access to the sea. The seaweed is gathered in the New Year and [824] trodden into the ground in the spring and apparently gives excellent results, but too much labour is involved in carrying it to crofts in the centre of the township. Forty years ago [423] each croft had rights to the "red" and "black" seaweed along the coast.

The crop acreages for the whole township will be found detailed in Appendix C (1) The area of oats for each croft varied between 0.25 and 2.50 acres whilst the maximum for sown grass was 1.5 acres. The excellent crops of hay from sown grass would suggest its further extension, but unfortunately most of the land suitable for cultivation is already under oats and potatoes. The practice of undersowing oats was not particularly widespread whilst only two small strips of oats-rye mixture were found. One crofter had also obtained good results in a small patch with seven different vegetables, whilst soft fruits are to be planted next year. The two sets of 'run-rig' crofts practise a fixed run-rig with the usual rotation of oats and grass on the strips.

231 In cattle stock (Appendix C) the township has 28 three year-old beasts, 2 one year-olds, and 24 calves. Only 6 registered occupied crofts have no cow, two crofters have two cows each, and one crofter has two cows and two calves. The township has no bull however and the nearest is at Carloway or Callanish. With a much smaller number [178] of cattle than that of thirty years ago there is now no need to make the annual summer visit to the shielings, a practice which died out in Tolsta Chaolais between 1920 and 1930. Pastures could however carry three times the present amount of cattle. The souming
● 233 of 1 cow and 6 sheep per £1 rent is now apparently ignored. The approximate total of sheep for the township is 1,500 whilst for 1958 it was about 1,470. The total of lambs was approximately 520 but most crofters found it difficult to give an accurate figure since some might have been lost on the moor during the summer. The highest number of breeding ewes for any one croft was 112, of lambs was 34, and of other sheep was 26; five crofters, however have no sheep at all. Before 1939 a shepherd was employed by the township when the sheep were sent to the moor. The shepherd was usually a young boy just left school and was paid by each crofter according to the number of sheep the latter sent to the moor. This has been discontinued but a levy, of 5s. per croft and 2½d. per [231] head of sheep, is made for the upkeep of the township fence. Finally, almost every crofter keeps at least a dozen poultry.

221 The movement of stock over the grazing areas is summarised as follows:
231
233

(1) From November 13th to May 1st. cattle are usually in the byre, depending on the weather, and sheep can wander anywhere. Crofts should be open to common grazing unless all the crofter's stock remains within his own croft boundary.

(2) From May 1st. to May 20th. sheep are in the outer park.

(3) On May 20th. sheep are sent to the moor.

(4) Throughout the summer cattle are in both the inner and the outer parks.

(5) On October 1st. the sheep are brought into the outer park.

(6) On November 13th. the sheep are brought into the inner park.

464 Details of population and employment will be found in Appendix D. It is a very striking comment on the state of crofting in this township that only four persons are

Note: Where there is a large area of non-crofting holdings (feus, allotments, cotters or squatters) this is shown separately against (b).

Cattle are kept on 162 of the 219 units; in all there are 180 cows of three years and over, 47 young cattle, and 110 calves. The usual practice is to suckle the calves, and sell them as soon as they qualify for the calf subsidy; lack of winter-keep is one of the reasons for this practice. The breeds of cattle are mainly Shorthorn and Aberdeen Angus with a few Highland cattle. The other function of the cow is to provide milk for the household; household without a cow rely entirely on tinned milk. Cattle are sold at the twice-yearly market held at Garyward, but prices fluctuate greatly. The township of Park certainly do not carry a full souming of cattle.

Sheep are more important than cattle in the crofting economy in Park. The breed is the Lewis Blackface, a small, lighter type of the Scottish Blackface breed. The ewes are pastured on the common grazings in summer, and are grazed on the croft land in winter. The standard of Park sheepstock is also low as few crofters dispose of cast ewes or have a defined breeding policy as all stocks mingle freely on the commons. The lambing percentage for 1958 was about 60 per cent of the number surviving in August compared to the total ewe stock was 52 per cent, but it was generally agreed that 1958 was a poor year. A further indication of the quality of the sheep is that in the fishing townships, a ewe fetches from 35 to 50 shillings, and a lamb about 20 shillings locally. The low lambing percentage and poor prices can be partly attributed to the lack of good grazing and to overgrazing, bad disease and losses in a treacherous common pasture raise the mortality rate. In general the sheep are left to fend for themselves with a minimum of shepherding although the more progressive crofters hand-feed the ewes and hogg in bad weather.

The majority of the crofters in Habost and Kershader, and a minority in Garyward, rent additional grazing in Park Deer Forest, paying a fixed sum for each sheep. Sheep from these townships pay much better prices; in the other townships a few wedders and fewer cast ewes are sold to the Borrowey butchers. In many flocks, wool provides the only income from sheep.

It is evident from Table II that the sheep souming is greatly exceeded. In the calculations, ewes are taken as one unit, and 'other sheep', wedders and gimmers, have been calculated at half rate. On this basis, the overall sheep souming is exceeded by 70 per cent and in only one township is the stock comparable to the souming. Overstocking has been encouraged in crofting districts by the ewe subsidy which was in operation till 1956 when it was withdrawn. A remarkable rise in numbers of sheep recorded in the Outer Isles coincided with the introduction of the Hill Sheep subsidy in 1938.[1] Overstocking is without doubt the chief reason for the high mortality rate in sheep. Calculation of the overall relation of the actual cattle and sheep stock to the soum shows that the common grazings of Park are overstocked by 15 per cent. It is, however, impossible to calculate an exact figure, as the number of sheep grazed in Park Deer Forest was not recorded. It is also evident from the individual croft surveys that the cottars, squatters and feuars, who have no rights of grazing, have stock equivalent to 157 cow units or 12 per cent of the total stocking. Thus the crofts of Park are maintaining an average stock fairly close to the souming, but the cattle-sheep ratio of 1:28 is too low for proper management of the pastures.

In general, a low standard of husbandry obtains in Park but it is clear that the agricultural townships are much more efficiently operated than the fishing townships. Overstocking occurs in seven of the twelve townships and sheep stocks are, with one exception, higher than the sheep soumings

1 In Scotland as a whole, the number of sheep recorded declined from 8,007,134 in 1938 to 7,336,000 in 1955.

Table III reveals that there are 177 agricultural units with a souming; ten units are crofts in Glengarvie without a souming and the remainder of the 219 units have no grazing rights. From this Table, it is clear that full stocking and overstocking occurs with longer size of the croft; the six units of ten acres and over, on the basis of stock carry, would appear to be the most intensively worked. In all, just over half of the units take up their full souming. Table IV gives an indication of employment ancillary to croft work for 141 of the 219 units and it would appear that neither ancillary employment nor age is significantly related to the intensity of croft working. Table V points to the fact that more full-time crofters are to be found on the larger units but that less than one in four of the younger and more active men are full-time crofters. Tables III, IV, and V underline the fact that the larger units are also the more successful units and it is significant that the larger units are almost all on the better land in the agricultural townships. The average size of holding in the agricultural townships is nine acres, compared with less than eight acres in the fishing townships, where the land is much poorer and the cultivable area much more restricted.

The trends in agriculture are illustrated by Tables VI and VII. The Crofters' Commission made a survey of farms in Lochs parish in 1883; from this and Table VI it is evident that the number of cattle was much higher at that time and that the cattle-sheep ratio in the arable townships was 1:4 as compared with 1:28 today. Unfortunately, no agricultural statistics for the parish of Lochs as a whole; separate figures for Park are not available. Since 1913, radical changes in the crop and stock pattern have taken place. Horses have all but disappeared, and the cattle-sheep ratio has risen from less than 1:10 to 1:28 for the whole parish. Since 1938, cultivation in Lochs Parish has declined by 36 per cent. Large areas of hay-beds, no longer cultivated, are visible landscape signs of these changes. Garyward, the sole area for hay-bed cultivation, is no longer cultivated to the upper parts of the crofts. In fact, many of the crofts no longer use seaweed as a fertiliser.

From the foregoing account, it is clear that there are two major agricultural problems in Park, the lack of sufficiently large crofts with good arable land and an insufficiency of common grazing; these deficiences bring in their train the problem of overstocking, and the existence of uneconomic holdings.

The more progressive crofters, significantly resident on the better crofts of the agricultural townships, have shown how croft land can be improved by re-seeding and sowing down to grass, practices which could be fruitfully extended throughout Park. In addition, several crofters by co-operative effort, have reseeded small areas of hill land adjacent to holdings in Airidhreonach and Balallan and have not been lived on for forty years and ten years respectively.

However it is clear that it is not possible for 219 viable agricultural units to be maintained on the present crofting area. The optimum size of croft which could maintain a family is a moot point; for the location and situation of a croft and the quality of the land and common pasture would all have to be taken into account in making an assessment.

This problem was referred to a practical agriculturalist who was asked to state what size of croft and number of stock would be required to provide an annual income of £300, excluding croft benefit (milk, eggs and potatoes consumed on the croft) and any costing for labour. To fulfil these conditions, one of the fishing townships was carefully analysed, and the expert came to the following approximation, assuming that the rules of good husbandry were in force after the croft had been brought up to a good standard of cultivation and re-seeding had been carried out where possible on the hirsel and common Pasture, and provided there was no overstocking, and that present favourable subsidies and prices continue:-

[Seafortthead]

Table XVII reinforces the idea that there is a striking dichotomy between the agricultural and fishing townships. The former are characterised by a more stable population trend, the significantly lower of the population in permanent employment North of Park, and a smaller loss by migration. In the fishing townships, where growth and decline have been equally meteoric, there is a larger proportion of persons in permanent employment North of Park, and migration has been more significant. It also is significant that there is a smaller natural decrease of 0.5 per cent in the agricultural townships. The only township which shows a natural decrease over this period is Calbost, one of the fishing township.

SEAFORTHHEAD AND SHILDERSHIN

Rachel A. Hirst

Seafortthead and Shildershin are separated by 4,485 acres of rough grazing, the former lying on the northern shore of Loch Seaforth and the latter on the southern shore of Loch Erisort.

SEAFORTHHEAD

Seafortthead, the most isolated of all the Park townships, consists of three crofts and a gamekeeper's bothy. The township is situated between the hills and the sea, the hills rising to 700 feet immediately behind the land either steeply in rough uncultivable moorland covered with many boulders, or more gently in rough pasture. Shall-sand is used to fertilise the parks but generally below the road the land slopes gently and cultivation is possible to about 5-10 feet above the road, but the land is completely flat. Here, however, the hay-beds are very boggy and rushes have appeared in the top part of the cultivation ribbon.

The soils are deep near the shore due to soil creep; higher up they are very thin and peat accumulates to at least 3 feet both below and above the road. There is little cover; bracken is rare, but silverweed and heather, moorland sedges and grasses soon colonise disused hay-beds.

Legally there are three crofts but only one is still cropped, the other two being used solely for grazing. There is, however, a gamekeeper's holding within the township boundary worked as a croft. The other two crofts are used as ancillary grazings to holdings in Airidhreonach and Balallan and have not been lived on for forty years and ten years respectively.

The chief crops are oats and potatoes, though the gamekeeper had a patch of turnips and potatoes; the former had grown them during the last four years until 'finger and toe' decayed. Patches, about half an acre in extent, are drained with stone drains and ploughed by tractor. After which potatoes are grown in clean the soil, followed by oats for one year and then sown hay for three to four years. This is not strictly adhered to and several hay-beds appeared to be in natural hay. There is no peat-cutting on crofts as peat is assured just outside the township fence on the common pasture. Liming has been poor for the past two years being only 50 per cent in 1958; the stock carried is twice the sheep soum. The cattle, Highland and Ayrshire or Shorthorn crossers, are below the soum, but previously nine cows and followers have been kept.

1884. In been a great decrease in population and cultivation since the resettlement in 1883. In Seafortthead and Shildershin as a whole, there were twelve crofters before the

with heather and peat on the higher areas, hay is taken of 19.25 acres. Four acres, mainly for the Kershader crofters, are worked by spade, but most of the cultivation is by tractor hired from Balallan or, in 1958, from Habost. Lazybeds are common and in some cases are carefully renewed, but the present tendency, reaching it extreme in a field of about ten acres on one croft, is towards the formation of larger, ploughable fields for ease of tractor operation. Most cultivation is in lazybeds and land, with little manure, is cropped until it is exhausted. The only crops are oats and potatoes, with some garden plots of cabbages, turnips and carrots. The potato main crop is generally Sharpe's Flyaway (Golden Wonder on one croft), with a couple of rows of Sharpy Blue or Edzell Blue for earlier. There is no memory of Black Oats (Avena strigosa), and hare (Hordeum vulgare) has certainly not been grown since 1920, and probably not since 1909. The oats are grown exclusively for winter feed and are harvested with sickle and carried home in sheaves. The last water mill in the locality went out of use after 1914, the last handmill in 1916; no grain has been sent to Borrowey since about 1930. Rotations are extremely irregular and hay-beds are still cultivated with alternate crops of oats and potatoes and have heavy seaware and manure applications, but most crofters have a rough idea of the sequence of potatoes, oats, new grass sequence. Fertilisers used are seaware and manure (ben croft), manure (eleven crofts), shell sand (one croft), lime (two crofts) and artificials; 'Potato manure' and 'Nitrate of ammonia' on eight crofts. Artificial fertilisers and much of the seed are obtained through the Crofters' Agency.

The only two horses ever owned by this township were kept on croft 11 from 1936 to 1953. The plough was first introduced in 1936. When a tractor from Balallan became available for hiring in 1953, the horses were disposed of. The stock consists of some ewes by sire, young hogs and sheep per croft in proportion to rents and range from 3 cows, 3 young beasts, 69 sheep down to 1 cow, 1 young beast and 23 sheep. Eight crofts earned that entitlement but no croft produces hay but the souming and the deficiency is mainly in cattle, especially young beasts. On the other hand, no crofters cut in anticipation of a subsidy; only one crofter cuts a proportion of seaweed. Cattle are kept for domestic milk supply, and calves, having qualified for subsidy, are normally sold at 6 to 8 months. 18 acres of the common grazing were re-seeded in 1957 and the following rhythm for milk cows is developing:-

(a) As soon as the weather allows in May, the cows are put out in the park for about three weeks.

(b) Next, about 6 weeks are spent on the common grazing between the ring fence and the new fence erected in 1957.

(c) Back to the re-seeded park for about five weeks.

(d) Return to the crofts for the winter, being let out either to the park or to the common grazings whenever the weather is suitable.

The young beasts spend much of their time on the outer common grazings. As most of the crofts, beginning with one in 1938 and ending in sequence with 10, 11 and 12 probably in 1959, are fenced, the old arrangements for township commoning from 15th October to 15th May are now obsolescent. Another park was also fenced for general purposes and for weaning in 1957. Prices for calves and cattle are very low and this discourages cattle breeding; on the other hand, lack of winter keep enforces an occasional sale.

The rhythm of sheep husbandry is largely independent of that of cattle:-

(a) By 20th November all sheep, except possibly the lambs, are cleared from the crofts for the tupping of breeding ewes thereon till 31st December. Every crofter now keeps his own ram, exchanging it or buying another at least once in five years.

[Kershader]

(b) From New Year to mid-April most sheep are kept on the common grazing. Practices, however, are irregular: some flocks are usually hand fed, others are left to fend for themselves; in the case they hunt near the upper limit of their home croft and remain fairly close at hand. Most crofters keep their lambs, probably hoeing turnips at intervals, although they may be in the morning and turning them on to the common grazing in the evening. All this naturally depends on weather and other factors.

(c) From mid-April to May, lambing takes place on home parks.

Most crofters let their ewes-with-lamb out at one date.

(d) At the end of June, gimmers and wedders are clipped.

(e) In mid-July the ewes are clipped.

(f) The lambs are weaned in the first and second weeks of August.

(g) The dipping takes place in October and the rams are brought on the crofts.

There is no general sale time, sheep being sold or slaughtered at all seasons. There is no club stock, but in 1957 a few flocks of the Scottish Blackface breed were introduced. Crofters have not taken full advantage of the arrangement, first established in 1941, to graze sheep at 2/- per sheep and 1/- per lamb in Park Deer Forest. Hence irregularities of rhythm are introduced or exaggerated.

Sheep are not particularly profitable: in general, wedder fleeces give 3½ to 4lb, ewe fleeces about 3 lb, and the wool is sold to the Borrowey mills and to the West Marketing Board. Average carcass weight is reported to be 41 lb. Ewes are usually sold at 6 years and culled at 7, but never above 8½. Bracy and flake are kept under by medicaments but remain potential dangers; 'Black leg' is still a serious problem. Many sheep are drowned in the bogs in Spring and late snows (1955, 1958) are disastrous for lambing.

Under-employment is a serious problem in Kershader. There are nine males classified as full-time crofters, but probably only half of these lives on one croft and are in fact in this category; and of the total of thirty males with their homes in Kershader, only fifteen of the invisible population are permanently resident. There are twenty-eight females with their homes in this township, but on only six crofts do any permanently resident females help with croft work. Local ancillary employment consists of weaving, fishing (for domestic consumption only), and work on the roads. Income from ancillary employment is very meagre. Cattle are kept for domestic milk supply, and calves, having qualified for subsidy, are normally sold at 6 to 8 months. The only resident professional worker is a nurse. Ancillary employment must be, and is, sought from the township. As a result, the population of Kershader has decreased from 1939 to 1958, and is expected to rise in the future. As a result, the population of Kershader has decreased from 1939 or as being resident, periodically away and permanently away in 1958. 19 have left the area for good, 4 are permanently away, 6 periodically away, and 43 are resident. 43 are resident, 43 are resident, 43 are resident,

[Coverata]

Each croft is fenced but has a gate giving access to the common grazing, in which each crofter holds an equal share. The township has no specially enclosed area for fanking or other purposes and no fixed date exists on which the crofters open their gates for winter grazing. Breeding ewes are normally brought in for tupping in mid-October and November when crops have been gathered, and lambing takes place in late March or April. After dipping and inoculation with vaccines for black leg, braxy and tupping, the sheep are put out on the common grazing in the second or third week of May.

The 642 acres of common pasture support a sheep stock equal to the sheep sown, but the overall stocking is only 80 per cent of the total sources, the crofts only carrying a proportion of their sheep, while the others are well below the number required for greatest efficiency. The grazing is, however, good and carries a fair number of cattle, owing to the character of grass, the heather is valuable for covering the boggs. Lewis Blackface sheep are the predominant breed and the wool, clipped in July, is sold to the Stornoway mills and the animals themselves are sent to the slaughter house. The 1958 lost lambing was exceptionally high owing to a cold, dry spring preceding the greater part of the lambing of the ewes. More than forty lambs and thirty ewes were lost by the township last winter, a number four or five times greater than the average loss.

Six cows, two heifers and four calves are kept in the township and tethered most of the year on the crofts. Calves are born throughout the summer months, but whereas early-born calves may be sold in the autumn at six months old, those born later must be retained to eight months old until the Spring sales. The cows are served by the Department of Agriculture Highland bull at Habost, but although good prices are obtained for best cattle, it is felt that for the family milk supply, a dairy bull would produce a better strain.

In addition to keeping stock, oats are cultivated on five holdings and potatoes on six. In most cases the land under each crop is less than half an acre and nowhere does it exceed two acres. The land has been built up into lazybeds about six to eight inches high, separated by open drainage channels and worked by the spade. There are only two holdings where a tractor (hired from Habost) is used and the acreage cultivated only amounts to three-quarters of an acre. Conditions are not altogether suitable for mechanisation at present, for the terrain is very uneven and broken up by rocks and steep faces of bare rock.

Neither Toristo nor Caverata is on a main road. The former is served by a track joining the road near Cromore, while the latter has a secondary road running as far as the township dyke, and an inferior footpath joining the main road at Cromore. The lack of a good road within the dyke acts as a deterrent to the use of modern equipment and fertilizers. Artificial manures, based on only three crofts, must be carried over rough ground from the dyke. This lack of facilities to improve is perhaps even more marked by the fact that on one holding alone is a rotation practised (potatoes, oats underseen with clover, ley for three or four years, oats). Apart from this one instance, potatoes and oats are sown, perhaps alternately, on the same strips for many years. Natural grass yields the bulk of the hay but in the case of the crofts with lazybeds that were formerly tillage. On one croft there is upwards of quarter of an acre where the old ridges can be seen to have a reticulate pattern and are thought to date back more than one hundred years. A short distance beyond the township dyke is a similar stretch of land, now colonised by heather.

Peat still forms the principal fuel and, apart from one half acre patch within the dyke, is cut on the common grazing, as near the road as possible in May and June, and later brought home by creel, bicycle or tractor. Three of the six operative units still have gardens and all keep up to twenty chickens; rowing boats for line fishing, solely to supplement the larders,are also maintained.

In 1841 population records show that there were twenty-two persons at Caverata and seven at Toristo. After 1881, when maximum figures of fifty-three and thirteen were noted, there was a secondary peak in 1911 in Caverata, followed by a steady drop to twenty in 1951 and eighteen in 1958.

[Coverata] [Cromore]

The 1914-18 war had a marked effect on the Caverata population - 16 out of 54 (29 per cent) left after 1911 and no comparable population has since 1939, seven people have migrated to Stornoway or the mainland, (16 per cent of the total 1939 population), and six of these were from Toristo (i.e. 50 per cent of the 1939 Toristo population). Only one family now remains in Toristo. The demographic position is becoming more acute for there are no young married couples and no youngsters growing up. The girls have left to marry and most of the men have sought temporary or permanent employment elsewhere, for with better communications, education and the radio, the pull to the towns has become stronger. There are now only two people in the township who could be described as full-time crofters, earning no supplementary income by weaving tweed on commission from the Stornoway mills.

Caverata is not one of the most progressive of the South Lochs townships. Although the crofts are fenced no attempt has been made to improve the grazing by reseeding with better grass or to improve pastures. At present, the grazing is fully stocked according to the sown, but the committee has not yet taken action. Most crofts have a cow and a calf or two heifers in the common grazing and March grass would benefit every crofter. Lack of manpower may in part account for this deficiency but even a small acreage of re-seeding would be a great asset.

The future position of the township is rather doubtful: it is not the best type of land for mechanisation and is badly served by communications. The future of Toristo appears to be probably one of abandonment, unless it is more easily linked with Cromore. The possibility of a good road being built here is remote, as there is only one family to serve. The main part of Caverata is also open to question. Amalgamation of the crofts would not necessarily make more efficient units for the present units are not used to their full extent. Amalgamation would benefit Cromore and Toristo township a great deal, as the Caverata population is rather small to flourish in isolation. The future of Carnyard, Kershader and Habost is one of a separate township or amalgamation with Cromore. It is not difficult to see Caverata, and Toristo, following the same course as Calbost and in thirty to forty years being little more than grazing land.

CROMORE

G. Mary Swindell, B. A., and Dennis F. Fancett, B.A.

Cromore is situated on a peninsula between Loch Erisort and Loch Cromore. Approaching it from the mainland, one sees a few houses and a settlement, but in the summer months the number of houses is attained on the owner's croft. The crofts are so arranged that each has a portion of land on the common and a portion of arable land at present in the township, but formerly there was only one tweed per loom serve. Sole are poor and thin, and have not numerous outcrops of barren rock amongst the arable land. The natural vegetation is heather interlined with extensive patches of rushes and coarse grass, the latter predominant of the "intrusa" variety.

The township comprises twenty-seven crofts and there are twenty-seven working units; two crofts are subdivided while another four form double crofts. In addition there are five cottars and the Schoolhouse fox. Outside the township dyke there are two farm and four squatters. The croft layout differs from most other townships as each croft is in four non-adjacent pieces, one piece around the house, another above Creag Cromore and two pieces on another area of enclosed land on the common. Two crofts on the eastern side of Loch Cromore, have most of their arable land around the croft-house while three crofts have only one share in the other area of enclosed land.

Until this decade all the land around the houses, and much of that above Creag Cromore, was regularly cultivated. Some of the lazy-beds on the higher land are being cut for hay this year but cultivation is limited to the land around the croft houses and is completely unmechanised. The only crops at present are oats and potatoes and these are usually grown in rotation. The crofters sowed

[Cromore]

The crofters sowed clover with their oats in 1957; the quality of most of the natural grass could be improved considerably by extending this practice. Several of the crofters have been experimenting with the application of fertilizers to improve the grazing. Lime and phosphate, but seaweed and byre manure are widely used. Only seven crofts have cultivated more than half an acre but that of No. 23, partially enclosed by a dry-stone wall) has produced crops of lettuce, cabbage, turnips and carrots.

The sowning for Cromore is one cow, one heifer and eight sheep per £1 rental, but is not enforced. The crofters keep the stock which they can manage to maintain throughout the winter and so one appeared to be dissatisfied with this arrangement. In fact the sowning is exceeded by only seven crofters and the total stock for the township is only 75 per cent of the sown. Lambing takes place in April and May and there is a high proportion of ewes which lose their lambs. The sheep are clipped in July and each crofter usually clips his own sheep. He either sells the fleece or has it spun in Stornoway or hands it to a crofter who does the spinning. The lambs are dipped in the second week of August and then dipped; November is the tupping period and almost every crofter had his ram. Most crofts have a cow and a calf or two heifers in the common grazing and March is the time when grass would benefit every crofter. Lack of manpower may in part account for this deficiency but even a small acreage of re-seeding would be a great asset.

Shielings, situated on the common grazing between Calbost and Cromore, were used until the 1890's. Active land use has gradually declined; in the 1920's, much of the outrun was under cultivation and from an air photograph, it is evident that hay was being taken on the strips above Cromore in 1946. The present trend is a continuing decrease in the amount of arable land but the Crofters Commission has not yet put into effect its proposed plan to the amalgamation of crofts; it is unfortunate that all crofters are not willing to take part. Peats are now being cut near the boundary between Caverata and Gravir, about three miles south-south-east of Cromore and one mile north of Gravir.

Cromore was once a prosperous fishing village but now it has no fishing boats. Two Cromore fishermen work on other boats from Marvig and one from Stornoway) and there are a few men who would welcome the opportunity to start fishing, but there is little prospect of this, however. The landing-stage, completed in 1937, is regarded by many as a "white elephant" and, in fact, at low tide it is useless. So much for the hopes that it might have been used by cargo vessels bringing goods to Park.

In Cromore there are fourteen looms for the weaving of Harris Tweed. Tweeds are obtained by trading tweed in exchange for yarn from Stornoway and one loom is present in the township which only one tweed per loom serve but the weavers could quite easily double their production. During the war years, the industry was relatively prosperous. Running is a winter pastime but only for pleasure, although one household possesses a knitting machine.

In common with the rest of Park, Cromore has a high proportion of old people. Many from the middle age groups have sought employment on the mainland, and the teenagers, many of whom have been at school in Stornoway, seek jobs there or on the mainland, returning for holidays and assisting with the croft work. Some younger folk are resident to care of aged parents.

Cromore is only eight miles by sea from Stornoway yet all communications with the town are by road - a distance of thirty-two miles. There is a daily bus service and the sub-postmaster has a van which is occasionally hired. Some people recalled that the only route to Stornoway was once by boat to Crossbost and thence by bus. One resident owns a lorry and this is used for most of the haulage in Cromore, particularly for bringing home peats during the summer. As a result of recent additions to the village and timetables were called, Cromore crofters contribute to vehicular traffic. There are no shops in Cromore but grocery vans call on Monday, Tuesday, Wednesday, Thursday and Saturday.

[Wertrig] [Calbost]

In conclusion, it may be said that the problem of Marvig's future, and that of other crofting townships, is not only one of adverse aspect, soil and weather conditions, and of distance from markets, but a problem of the population finding a stable and viable level where agricultural units are large enough to encourage the active and enterprising section of the population to remain, and a problem of finding capital to equip a modern fishing fleet.

CALBOST

Anne Cooper

Calbost is situated five miles to the north-east of Gravir on the Minch coast of Park. It occupies a beautiful site on a hillside between a small loch and the sea. The lands are fertile and the soil of good tilth; croft houses are scattered over a shelf 50 feet above sea-level round the sides of the hillow and along the shore of the loch. The township is well-wooded and sheltered.

The cultivable soil, a mixture of peat and well-drained gravelly drift, is on the higher ground, although here the rock outcrops in many places. On land formerly cultivated, bracken is spreading rapidly and now covers a large proportion of the surface, although twenty to thirty years ago it was unknown. Heather dominates the common pasture and rushes are widespread in the low-lying and waterlogged land. The Fifty-eight operative units participated in this reclamation work, and the plots participated in have an average size of 58 acres, but, as the land is sufficient as aged tenants are unable to carry out such work. This scheme could be extended annually, if adequate manpower and capital were available. Pasture improvements, however, are not without limits. Re-seeding on a large scale would enable better stock to be kept rather than greater stocking, at present the sown is fully stocked and there is a plan on the common to allow a cow and lamb call for as little as £2 10s to £3 10s, an indication of the consequences of over-stocking. The cattle stock is below the sowning and the number of cattle is one of the lowest in Park. The agricultural crofters since the 1930's for at that time as many as six cattle were kept on the larger crofts. The total stock kept in Gravir and Glengravir exceeds the sowning by thirty-five per cent.

The great majority of the crofts can certainly not be considered economic units. Judging from the sowning, the average size of holdings is about 7 sheep per pound sterling of rent; in Gravir, where only seven crofts pay more than £2 rent, they were never intended to be sail-supporting agricultural units. The produce of two cows and sixteen sheep, with potatoes, and in formerly days, hens or ducks, locally milled by the three Gravir water mills, could scarcely ever have maintained a family. Fishing was the complementary occupation, and in 1951 there were more than nineteen boats and eighty-nine fishermen were registered at Gravir. Today, only one boat fishes commercially for lobsters.

Calbost is primarily a fishing township in spite of its harbour being so exposed: boats have to be moored in the adjacent sea-loch because of being exposed to the bay. The decline of the fishing industry which has prevailed in Lewis has contributed towards the almost complete desertion of Calbost, leaving only a few boats now used only for inshore work. Croft income is supplemented by only two of the men in the township, one a weaver and the other in the Merchant Navy. Although there are a few productive gardens, no attempt is made to market any produce.

The township dyke is very close to the cultivated ground and in the past shielings were not so widely used in Calbost as elsewhere. The cattle were instead brought near to the dyke for milking and allowed to graze on the common unattended. There are ruins of shielings to be found on the hills around Calbost but a more interesting feature is the second dyke; enclosures were made adjoining the main dyke and in the late summer the cattle were brought to fresh pasture within these dykes before the opening of the township gates. Following the opening of the gates the stock are free to wander over all crofts but there seems today to be a move towards the complete enclosure of the crofts.

[Gravir] [Glengravir]

[illegible]ongarite is dominant. Ling, which has created considerable soil water, often occurs with Molinia, Nardus caespitosa and Eriophorium. A few rowans, usually near the shore, and willows, usually within stone enclosures, are the only trees to be seen.

Of the thirty-three legal crofts in Lemravay, nine comprise less than five acres, while the rest range between five and ten acres. Of the remainder, only two exceed fifteen acres and one of these, at 35 acres. Six unoccupied crofts are owned by persons other than their former tenants, so actually 27 acres of croft land are shared by twenty-seven holdings. The seventeen-acre 'outcast' was subdivided between fifteen tenants but combined with letting has resulted in four separate holdings occupying nine acres, and working another four acres. Thus the outcast today must be regarded the monopoly of four 'unofficial' holders.

Lemravay forms a quarter of the croft land in cultivable and even less is actually cultivated today: Figure 9 illustrates the crofting layout. The township lies on the stony slope of a hill and permitted the cultivation of tiny 'lazybeds' and the total cultivated area is now about 48 acres. The best soil is found on the gentle slopes, where the soil is deep and free from stones. Croft shows signs of former, more extensive, lazybed cultivation, often covering at least two acres. For example, on the south side, extensive ruins of lazybeds at about 225 feet.

Oats and potatoes, 29.5 and 16 acres respectively,occupy almost all the cultivated ground. Most crofts grow about half an acre of potatoes and one acre of oats; both acreages have been increased in importance. No hens is now grown, though before 1900 it was grown in quantity. Plants of the hare moll, which caused no function at the beginning of the century, can still be seen in Lemravay, and the plant is particularly abundant. Only four crofts had sown grass in the last three years in all. Few vegetables other than potatoes are grown though carrots are said to grow well and turnips are sown for the cattle. Lemravay is a very wet township and cannot be productive and almost every crofter used some seaweed and at least twenty drew shelldrift and artificial fertilizers in 1958.

Stock totals have declined recently but the township has 36 cows and 22 calves. Only one crofter without cattle and 22 of the 33 working units have a cow and a calf. The township has an Agricultural Department of Agriculture; one of the few remaining stallions of the Cross Lewis breed in the township system is that this animal is fed by the crofters, in rotation, during the winter.

All but two crofters keep sheep; stocks vary between ten and 120 per holding but the majority have about 25 ewes with two lambs. Although numbers have declined recently, the 3,025 acres of very moderate common pasture support a stock of about 1,150 sheep, including about 650 ewes and about 300 lambs.

The sowning is not enforced in Lemravay and it is remarkable that the total stock tallies almost exactly to the sowning. An examination of the sheep records shows that the stock (including the lambs) considerably exceeds the sheep sown of 620. It is interesting that it is nearly always the working units of over 10 acres that are responsible for the excess of the sown, eight crofters of which they are entitled to. Most of these crofts are grouped on the eastern side of the township where crofts have a larger share.

Thus, while overgrazing is not so severe as in many townships, it represents a potential danger particularly if the common pasture is not improved. However, in 1958 ten acres of the common pasture have been enclosed and re-seeded. Six acres were sown with ordinary mixed grass seed, two acres with pelleted seed and two acres with pelleted and inoculated seed. The sowing was taking part in the scheme put on 100 tons of seed to help drain and aerate the peaty soil, 25 tons of ground mineral phosphate and 2 tons of concentrated compound fertilizer, grades 1 and 2 - 40 per cent by head. The area was sown in May 1958; by the following August, there was a striking difference between it and the unreseeded pasture. Next Spring, eleven cows will be grazed on this area. If success of this scheme, it is hoped that more of the crofters will co-operate in re-seeding further areas.

re and there in small patches of less than a quarter acre and therefore do not appear our summaries, appendices A (1) and C (1).

The amount of cultivation carried out depends on three factors:

) stock, particularly cattle, to be carried through the winter,
i) size of family, which influences the amount of potatoes grown,
ii) available labour, because cultivation is mostly by hand, especially in South Uig and Bernera.

he size of the effective agricultural unit has little influence on the area cultivated ithough it may bear some relation to the amount of natural hay taken. This can hardly e regarded as 'cultivated' and the acreage is difficult to estimate; the custom is to cut and when weather permits, and wherever there is a convenient stand of natural grass.

Hand labour is a necessity on most crofts in the Bernera district and on many lsewhere. The traditional 'lazy-bed' - a long narrow strip of cultivation bounded by eep ditches which may be half as wide as the bed - is a necessity on broken, rocky round on which the only soil is peat which often has to be gathered into hollows in order o get sufficient depth. The small size and long narrow shape of most crofts do not lend hemselves to tile drainage, which is almost unknown. If it could be extended it would e a great advantage but, in general, it would have to be organised by townships, or at east by groups of crofts, and the whole trend in management of croft land is towards ndividual occupation and use.

This may not always be a good thing. Fencing is a case in point. Until the last en years fenced crofts were rare altough small parts of crofts might be fenced and, in ome cases, a group of crofts might be fenced off from the rest. But, in general, the rofts were common land in the winter and used individually only from May to October. Fencing grants, and the encouragement of sown grass in rotation with oats, have hanged this. A great rash of fencing is appearing. This may not be altogether a good hing, particularly for the sheep in winter and spring; even if gates are still left open, tock are deprived of the ability to move for shelter. There may also be watering difficulties. Co-operative draining, cultivation and grazing, of groups of crofts if not of townships, would be more efficient and more productive.

Finally, we may remark on the curious insistence on hand cultivation of oats and potatoes for consumption on the croft, whilst cash crops well suited to hand labour, and which would be far more rewarding, are neglected. Flowers, vegetables and potatoes are imported into Stornoway daily on the mail steamer and even by 'plane. Neither climate nor soil prevents their production in Lewis. Moreover such crops could provide a much needed source of additional income. A few croft gardens produce excellent soft fruit and as the local season differs slightly from that on the mainland there would seem to be possibilities here, too. There have been virtually no agricultural innovations since the potato.

Economic and Technical Factors.

The agricultural income of a croft arises from:

(i) the sale of livestock, mostly store stock at the spring and autumn sales,
(ii) the sale of the annual wool clip,
(iii) the receipt of certain annual subsidies and grants.

These are the main items; in addition some may sell small amounts of potatoes, eggs and standing hay; a very few sell a little milk although strictly this is illegal. Such an annual income comes in three or four annual instalments, uncertain as to date and amount. Moreover, a crofter may suddenly and unexpectedly find himself deprived of a large portion of his income due to casualties amongst his stock or poor demand at the seasonal sales. Unlike the mainland farmer, should an islander withdraw his store

THE PATTERN OF CROFTING

427 241 178 423 477

Crofting, a distinctive system of land tenure, is confined to Argyllshire, Inverness-shire, Ross and Cromarty, Sutherland, Caithness, Orkney and Shetland, the seven Crofting Counties of Scotland. Small agricultural units sharing rights in common land, usually pasture but in some districts arable land also, survive in 151 out of the 163 parishes, and these holdings form the nearest equivalent to peasant communities in Britain, although only a small minority of crofters own their holdings, and the true subsistence element, implicit in any definition of peasantry, has all but disappeared.

175 427 241 423

Before 1886, the crofter was a tenant-at-will, with no security of tenure, and no right to compensation for improvements. The Crofter's Act of 1886, defined a croft as an agricultural holding in a parish where there existed, or had existed, rights of common grazing, and where the annual rent paid was less than £30. Security of tenure, and compensation for improvements were the main provisions of the 1886 Act; the rent qualification was later raised to £50. In all, there are about 20,000 crofts in Scotland today[1] and Collier[2] estimated the crofting population at about 100,000. The number of crofts in Park is 215, with population of 908. Thus Park forms a 1 per cent sample of the crofts, and a 0.9 per cent sample of the estimated crofting population.

161 162

Crofting Organisation, Layout, and Settlement.

423 427 241 311 632 233

The characteristic settlement unit is the crofting township: Figure 3 illustrates the areal distribution of the 12 townships in Park. Each township comprises two main elements, the individually held croft land, and the common grazings. The number of crofts per township ranges from 6 in Caversta to 43 in Gravir.

The individually held croft land (1,839 acres) is partly 'outrun' or permanent pasture and the holdings are usually but not always consolidated - in Gravir (Fig. 4) and Cromore some of the crofts comprise as many as five non-adjacent pieces of land. Each croft is normally separated from neighbouring units by a drystone dyke or fence but in Park, such demarcation is the exception rather than the rule.

The croft land is separated from the common pasture by the township dyke, a stone or turf wa The Park common pastures consist of 22,023 acres of moor grazing - generally very poor, ill-drained land with a large percentage of bare rock, areas of peat, and numerous lochs. In Park, only Oronsay common pasture is fenced, the limits of the remainder being faintly marked by crumbled turf dykes. Each croft has a defined right of grazing or 'soum' on the common pasture; the 'soum' is the number of beasts which may be pastured, a term comparable to the obsolescent 'gates' of northern England. In Gravir, the soum is 1 cow and follower or young beas up to 6 quarters old (i.e. 18 months), and 8 sheep, per £1 rent. There is also a system of stated equivalences (Gaelic 'coilpeachadh') in most townships whereby substitution of cattle for sheep and sheep for cattle is permissible: in Gravir, the exchange rate is one cow for five sheep. Soumings and equivalences vary throughout Park. In former times, when a subsistence economy prevailed, soumings were enforced but nowadays the majority of the crofters do not even know the souming o their croft.

[15] 1 Crofters' Commission, Annual Report 1958.

[13] 2 Adam Collier, "The Crofting Problem", 1953.

427 241 [22] 423 [17] [23] 175 235 Although the croftland is individually held, individual control of the crofts only applies for six months of the year. After the harvest, the croft land reverts to common grazing and the whole township stock graze indiscriminately over the crofts. Thus basically the whole area of the township, the individually held crofts and the common pasture, is common land, and it is clear that the agricultural revolution with its system of enclosure has not yet fully refashioned the Crofting Area.

Before 1900, there was a third element in the crofting landscape, the shieling (Gaelic - 'airigh'). The sites of the shielings are usually on slopes commanding a view of the surrounding area near a spring or stream and usually two to nine huts belonging to the same township are grouped together on a site; isolated shielings are rather rare. In order to conserve the pasture within the township dyke for wintering and to protect the unfenced crops, the cattle were removed to the hill early in June, and the younger members of the households went out to live in small stone or turf-walled huts to tend the cattle. The milk was either carried back to the township daily or made into butter or cheese at the shieling. The distance of shielings from the crofts varied from one to five miles in Park.

632 The affairs of the townships are managed by the Grazing Committee, elected triennially by the township and presided over by the Clerk of the Committee. The duties of the Committee in the past related mainly to the enforcement of soumings, but are now reduced to the disbursement of subsidies, although responsibility for the maintenance of the township dyke and the care of the township bull (usually lent by the Department of Agriculture but sometimes communally owned) are also the province of the Committee.

[361] [342] [78] The layout of the townships varies with the topography but the majority of the crofts are aligned in strips from the moor to the sea (figures 4 and 5). Most croft houses are built on the crofts; in former times, the majority of the houses were sited on the poorest part of the croft as all the cultivable land was required for crops, but nowadays the houses tend to be sited near the road.

162 361 427 241 [464] The official pattern of crofting is thus one of tenants, each living on his or her croft and sharing in the rights and duties of the township. Table I gives an analysis of the tenants of the 215 Park crofts. It will be noted that only one-fifth of the crofts are tenanted by those in the 15-44 age group: a similar proportion are tenanted by those over 65 years of age. Absentee tenants account for 14 per cent of the total. Women form under 10 per cent of the total, but only one in seven of the women tenants is the sole labour force on the croft. The intrinsic worth of the holdings can be inferred from the fact that two-thirds of the male tenants in the insurable age group take supplementary work, two-fifths of them furth of Lewis. With such a large proportion of the tenants either fully employed in ancillary occupations in Park or elsewhere it is hardly surprising that the theoretical township organisation exists mainly in name alone.

427 241 Each croft, however, is not necessarily an agricultural unit; some are sublet by absentee tenants or by tenants who are too old or too infirm to work their crofts. Of the 215 crofts, one-fifth are wholly or partly sublet. In addition to the legal crofts, there are unofficial holdings which fall into three categories, cottars, squatters and feuars, all legally without grazing rights. A cottar[1] is a person, usually a close relative of the tenant, who builds another house on

1 These are the de facto definitions. Section 34 of the Crofters' Act of 1886 defines a cottar as follows:- "Cottar" means the occupier of a dwelling-house situate in a crofting parish with or without land who pays no rent to the landlord, as also the tenant from year to year of a dwelling house situated in a crofting parish who resides therein, and who pays to the landlord therefor an annual rent not exceeding six pounds in money, whether with or without garden ground, but without arable or pasture land". For fuller treatment, see Scott, J., "The Law of Smallholdings in Scotland," 1933, pages 152-155. [115]

There is no legal definition of a squatter, and the above definition does not include any distinction between houses built on a croft and houses built on the Common Grazings.

well recognized relation of culture and environment.[9]

The economic foundation for the present day culture is commonly referred to as "the crofting system," a system of hereditary tenure of individually held small patches of cultivated land combined with communal use of grazing land. On his small plot, typically under five and seldom over ten acres, the crofter grows a little oats and bar for his stock, a few potatoes for his family and dairy cattle, and, in some cases, a few garden vegetables. Anyone who is acquainted with the Irish small farmer will recognize the underlying similarity of the two systems.[10] The communal element in the crofting system on Skye, however, is a distinguishing feature. In addition to his croft, the individual has a common, communrent right to a share in an extensive area of grazing land. Here he keeps a couple of cows and a score or two of sheep. After the harvest, the stock are frequently brought down from the hill and allowed to indiscriminately graze the arable land of the crofters who share the communal lands. Thus, the efficient economic unit is not the croft, the few acres of arable land, but rather a "township," a collection of crofts and the common grazing lands. The system dirtes from the township system which prevailed two centuries ago only by the holding of permanent, compact blocks rather than dispersed and shifting strips of arable land. It is a unique survival in Europe.

See, for example, Gresham, Schofield and Kitchener, Land Use in Native North America, p. 4.

[10]Cf. Conrad M. Arensberg and Solon T. Kimball, Family and Community in Ireland (Cambridge: Harvard University Press, 1940), pp. 5-7, 31-35.

to the traditions of the past. I shall discuss this further when I describe the extended family.

The Township. The township is a cooperating economic unit. Communal use of an interest in the common grazing lands gives the township its focus. Living on the several crofts, there still be found an aggregate of nuclear families and unmarried individuals who, especially in the older townships, are related and re-related on both sides. Only in the more modern townships does the degree of relationship become tenuous and finally disappear. In interpersonal activities the neighbors have a rate of interaction second only to that of the nuclear family.

The dominant social trait is the strong emphasis on the ascription of status on the basis of kinship, sex and age. There are no socially valued achieved statuses. The facts are simple. Males enjoy higher prestige than females, and the old men and women are respected by the youth. All of the same age grade and sex are essentially equal. Again we have a parallel with the Irish small farmer.[11]

There is no room for the expression of a role of leadership in economic activities. The governing principle of township administration is so-called primitive democracy. All males have an equal voice in determining the acceptance of any policy or action which concerns the group, and unanimous consent is necessary for the adoption of any change. Although each township has an elected grazing clerk and a grazing

[11]Cf. Arensberg, op. cit., pp. 45, 109-110; and Arensberg and Kimball, op. cit., pp. 63, 101-103.

Barley was pulled by the roots. The oats were either stored in a byre or built up in a stack near the house to be used as needed. The process of drying was known as kiln-dry. A woman took a handful of stalks and set fire to it. As the husks burned, she beat the grain with a flail, a stick or bunch of heather. Using kiln-dry, it was possible to dress, winnow, grind, and bake the oats into cakes within an hour. Kilns came into use in the late seventeenth century, but kiln dried grain was considered inferior to grain prepared by kiln-dry. A few water mills had also been built in the close of the century, but they were also unpopular. The barley was stripped from the stalks, which were used for house thatch, and ground in a stone corrie for griddle cakes or, later, for whisky. The rye, like much of the oats, was used as porridge.

The Stock and its Importance. The Skyeman, in contrast to the Highlander, was primarily a pastoralist. The stock included a small, hardy, scrawny breed of cattle well adapted to the rough terrain and excessively wet and windy climate, a small, narrow fronted sheep of limited value for meat or wool, ponies, goats, and pigs. The importance of the cattle can be judged from the valuation of the farms. Although the Norse system of land measure had replaced the pre-Feudal Scottish measure known as a davach, the amount of land required to support one head of cattle, with a cognizy measure of each lands, which were divided into penny lands and smaller units based on

[12]John Cameron, op. cit., pp. 170-171.

eighteen to twenty pennies equalling an ounce of silver, the land valuation on Skye was based on the number of cattle which a farm could support.[13] All other stock and the amount of cultivatable land was disregarded, being considered as necessary to the support of the tenants. Wealth was measured by the number of cattle an individual possessed; quality was a secondary consideration. The number placed on the land, therefore, was regulated by how many could be carried over the most favorable part of the year. As a natural consequence, a chief agricultural defect was overstocking.

The tacksman left their cattle and horses on the hill the year round. To attempt was made to separate the beef and dairy cattle, and, except for milch cows, which were given some straw, boiled chaff, and, in late winter, a few scantlins of oats, the cattle were not fed. Dung had to be lifted to their feet in the spring. The process of clapping, of course, destroyed much of the straw which could have provided winter feed for the cattle. It was until 1750 that any hay was grown on the island; it was used to feed the strays (young cattle). The small tenant and subtenant shared his house, and his cats, with his cow. Distemper and salmutrition was common. If a cow calved before the beginning of March, it was four or five weeks before she had enough milk for the calf, and the yield from the best cows was small.

Sheep were housed at night to protect them from the foxes. During the winter they received their the same care as milch

[13]John Walker, An Economical History of the Hebrides and Highlands of Scotland in 1764, (Edinburgh: University of Edinburgh Press, 1803), Vol. I, pp. 304-7.

cows. In the spring they were turned loose in the moors. For identification their owner either cut their ears or burned their horns with a hot iron.

As soon as possible after the spring sowing, the stock was turned to the rough grazing lands. Although there is no evidence to suggest that the shelling (from the Norse skeilig) life formed a part of the annual routine, its later importance seems it plausible. Rude huts of stone or timber were created in the higher mountain pastures to which the cattle were driven by the people of each farm. In the shellings the women cared for the stock and spent their time making dairy produce. For the young men and women it was a time for courting. The milk boiled (ses) must have taken only a limited part in the shelling life; they were kept occupied with other duties.

The Spring Trade. The chief industry of the Skye was the cattle trade with mainland Scotland and, after the Union of 1707, England. As early as 1502, "marts," surplus cattle sold off in the autumn, were being exported from the barony of Trotternish.[14] By the middle of the century, the Highland trade had grown to such proportions that the Privy Council was forced to enact measures for the preservation of order at the marts. At the close of the sixteenth century, a MacDonald chief had established a regular trade in cattle and ponies between the Outer Isles, Skye, and the east coast of Scotland. By the time of the Union, Skye had become the largest producer of

[14]For details on the spring trade, see A. R. B. Haldane, The Drove Roads of Scotland (Edinburgh: Thomas Nelson and Sons, 1952), pp. 2-13, 82-83.

Period III (1845-1926)

By the beginning of the third epoch of the modern phase of Skye's culture history, all the elements necessary for a social and economic readaptation to the wider commercial, contractual society had begun to function. The socio-economic changes in the preceding period, especially the period of commercialization of the land, the abolition of the tacksman system of tenure and runrig farming, the establishment of a village, and the extension of regular communications, had paved the way for the final stage in the process of commercialization. It was now an aforesaid fact that industrialization in Scotland was to be a Lowland phenomenon. The disparity between the Eastern and Western Highlands was already well developed.[15] The former had become a region of commercial farmers, men with the incentive and ability to make technological advances. Now economic deterioration led the landlords to attempt a basic change.

The bankrupt proprietors, anxious to recoup their losses, found sheep farmers eager to buy or lease the virgin grazing of Skye. Sheep farming meant the tenant would have a secure rental several times that his redrented crofters and cottars could pay, and he would not have to spend any capital either on behalf of the incoming tenant or on behalf of an indigent tenant unable to take over his own farm. The sheep farmer had the capital and, even more important, the incentive to adopt scientific methods. The crofter, obviously, had neither the

[15]Cf., e.g., Collier, The Crofting Problem, pp. 43-51.

means to acquire capital because he worked on very narrow margins nor the ability to specialize because his communal grazing system forced him to conform to traditional techniques.

The trend to sheep farming, developing from an early as 1810, led to a sweeping discord for the customary rights of the Skyeman. The factors (estate managers) of the absentee landed gentry, the new landlords, and the graziers had no associations with the tenantry and no use for their labor. Thinking only in commercial terms, they were only interested in seeing the higher prestige, the crofters' shelling, under the control of the factor in summer and the lower prestige, the crofters' arable, in use during the winter. The "Clearances" took two directions.[16] The majority of the people seem to have lost their common grazings. In Kilmuir, according to several informants, they were left with only one small area of hill. Glendale suffered from the same policy. Many of the tenants were removed from their township, by force or persuasion. To be exact, no fewer than sixty-two townships were cleared by the end of this period.[17] The evicted crofters were left to their own devices to reclaim a piece of the open moor, settled in existing townships, or banished from the island. In the area immediately to the north of Portree, forty crofters and

[16]For details on the "Clearances," see Alexander Mackenzie, The History of the Highland Clearances (Inverness: A. and J. Mackenzie, 1883), pp. 1-4.

[17]Report of Her Majesty's Commissioners of Inquiry into the Condition of the Crofters and Cottars of the Highlands and Islands (Edinburgh: Queen's Printer, 1884), Appendix A, p. 1. Hereafter, Report of Commissioners. Although it is commonly referred to in Great Britain, see also Donald Macdonald, The Past and Present Position of the Skye Crofters, Sheets 9-11, 21-22.

eighty cottars in four townships were replaced by two shepherds brought in from the mainland.[18]

As the interests of the proprietors and their tacksmen had clashed at an earlier time, those of the landlords and their tenantry were now irreconcilably opposed. The appearance of the Land League in England has been described as being characterized by absentee landlords, pastoralism, and a decline in the rural population through death and migration.[19] A process which had begun three centuries earlier in England and which had reached the Scottish Borders two centuries earlier had at last become operative on Skye. Let us examine the effects of full scale commercialization on the Skyeman.

The effects are evident. Commercialization and the evictions, which were a necessary counterpart, prompted emigration and confined the people within narrow limits, often, on inferior land.[20] By 1865 it was possible to describe Skye as a quiet pastoral land, desolate and deserted.[21] The people had been pushed into a few isolated, badly subdivided townships. In Bracadale, the first parish to be fully commercialized, there were once thirty-six runrig farms; in 1872 there were six large grazing farms.[22] The bulk of the population, 922, were

It is commonly referred to in Great Britain. See also Lachlan Macdonald, The Past and Present Position of the Skye Crofters, Sheets 9-11, 21-22.

quatters without any legal hold on the land. In Duirinish parish, which includes Glendale, only twenty-one families had enough land to meet even subsistence needs.[23] In one Glendale township, Holmisdale, some crofts of from on acres had as many as fifteen people to support.[24] Part of this extreme congestion was due to the continued practice of subdividing one's croft when a child married. Although the population in 1831 had fallen to 17,660, from 23,054 in 1841, almost every township had two or three times the number of families which had lived in them in 1841.[25]

The loss of the summer shellings and the common grazings meant few could keep sheep.[26] The looms were silent. Since the rent could not be raised on the value of livestock and was wholly or partially paid from the sale of cattle, all else, which the graziers' sheep did not eat, went to feed the cattle. The stills were all but idle. The people had to buy flour, meal, and bread imported from Glasgow. Almost all were heavily in debt to the local merchants, who seem to have been newcomers with more associations with the graziers than the crofters and cottars. Milk became a luxurious commodity. Frequently, the old cow had only enough for her calf. Unable to keep horses, the women became beasts of burden. They carried

[25]Smith, op. cit., p. 117; Commines, op. cit., p. 140; and Baxter Memoir, p. 13.

[26]See, for example, the loss of the income from the sheep as described in the Report of Commissioners, p. 1; Baxter Memoir, Appendix A, pp. 1-20.

the dung from the byre, the peats from the moor, and the cattle from the fields. When the land had been turned by ploughs, they poked themselves to a barrow. The crofters, in Kilmuir, as elsewhere, lost the right to the rivers for fish, to the moors for game, and to the coast for sea weed. The land became exhausted from over tillage. They had clung tenaciously to the old methods. Even if they could have obtained credit and could have broken with the ways of their forefathers, the fear of reckoning would have deterred them.

A degree of preciseness can be given to this general picture by comparing the arable acreage and stocking of Skye in 1810, the year grazing first appeared, and 1870. In 1810, 30,000 acres were listed as arable, either cultivated or susceptible to it; there were 18,000 cattle and 40,000 sheep. By 1870 no more than 8,383 acres were considered as arable; there were only 9,341 cattle, but there were 136,077 sheep. The magnitude of this change can be emphasized by adding the fact that there were less than 14,000 sheep on the Island at the turn of the century.[67]

The end of the shieling life brought an end to the traditional season for courting. Destitution forced a postponement of marriage and an absolute reduction in the number of marriages. As a natural consequence the birth rate declined. In the decade 1861-1870 the birth rate of Skye stood at 26.1 compared with 24.4 for Scotland.

[67] James MacDonald, op. cit., pp. 748, 754.

[68] Ibid., II, 553; III, 247; IV, 131; XVI, 148, 225, 537; XVIII, 184.

sufficiently to make age controls an irresistible force, the prestige status of the small number of the "elect," those who had experienced a saving change, and, in particular, the elders gave them complete control over all social and religious activity. In a later chapter I shall have more to say about these facts. The important fact which I want to emphasize now is that the religious patterns provided a framework in which the culture could find continuity and through which the society could achieve a reintegration. The abhorrence of pagan-like customs resulted in a change of content, but there were positive results as well. Above all, there was a change in focus for the culture and society. The decadent belief in clan brotherhood was replaced by a sense of belonging to a kneeling religious brotherhood.

Summary. The third period of the modern phase of Skye's culture history saw the culmination of the process of commercialization of the land. All the influences necessary for the conversion of the subsistence economy, albeit a much deteriorated economy, had begun to function. Sheep farming, on a commercial scale, formed the basis for the new economy. Newcomers with the incentive and ability to introduce improved methods of land utilization were replacing the conservative and impoverished crofters and cottars. As the commercial farmers consolidated their holdings, the communal townships were being obliterated. The concept of individual possession of the land was replacing the customary rights of the small tenants, and a clearly defined social hierarchy, based on

crofter pays only half of the assessment, which is based on rental value, and he is granted an additional benefit by having the land devalued seven-eighths for purposes of taxation. The majority pay £3 a year, or less, in rent, and, with a rateable value of 5s. or less, between 1s and 2s in taxes annually. Many pay no taxes.

On his small plot of land the crofter has his cottage. Here we find another rather unique interpretation of the laws of land tenure. Although the crofter is an occupier of the land, he is the owner of his dwelling. If he or one of his ancestors did not build the house, frequently with a grant and/or loan from the government, he will have paid "compensation" to his landlord for the dwelling upon accepting occupancy. Should he, at any time, relinquish his right to the croft, the crofter, in turn, will be entitled to full "compensation" for the value of the improvements on the holding as determined by the Land Court. The crofter's home is not entered on the county valuation roll and, therefore, is not subject to assessment.

In addition to the land under crops and improved grass, the crofter's rent entitles him to a share in the unimproved township grazing lands which are held in common and used under a system of allocation known as "souming." In each township, the collection of individual holdings, the crofters elect a grazing clerk and committee. They determine the number of cattle, sheep, and horses the individual is allowed to put out to graze. Usually each crofter has an equal share, but in

some townships the large crofter is given an allocation in proportion to his rent. The payment of his rent also entitles the crofter to gather seaweed along the coast for fertilizer and to cut peat for fuel on the common grazing or in special peat areas. In a number of townships he has a further right to pasture his rams in a "tup park" and his horses in a "horse park." These are lowlying areas of improved pasture. There is the general picture.

There are three important exceptions to the typical means of land tenure. Although the crofter is an occupier of the land, he is the owner of his dwelling. If he or one of his ancestors did not build the house, frequently with a grant and/or loan from the government, he will have paid "compensation" to his landlord for the dwelling upon accepting occupancy. Should he, at any time, relinquish his right to the croft, the crofter, in turn, will be entitled to full "compensation" for the value of the improvements on the holding as determined by the Land Court. The crofter's home is not entered on the county valuation roll and, therefore, is not subject to assessment.

In addition to the land under crops and improved grass, the crofter's rent entitles him to a share in the unimproved township grazing lands which are held in common and used under a system of allocation known as "souming." In each township, the collection of individual holdings, the crofters elect a grazing clerk and committee. They determine the number of cattle, sheep, and horses the individual is allowed to put out to graze. Usually each crofter has an equal share, but in

here of turnips. All of the oats and a large share of the potatoes and turnips are used to feed the cattle during the late winter and early spring. Some crofters, by no means all, have a small kitchen garden for cabbage, onions, and other vegetables. Usually, at least half the croft is left under grass, part of which is cut for hay. After all the people in the township have finished their harvest, on a day set by the grazing committee, the individual holdings in all but thirty of the townships are opened to communal use as winter grazings.[8] It might be added that the sheep and cattle often find the village of Portree a very lucrative pasture. It is not only the grass which entices the cows. More than one villager has had a tug-of-war with a cow bent on devouring clothes off the line. Another favorite food for the cattle is coal. As one man in the Braes said: "Ee burn half the coal; the cows eat the rest."

The Value of the Croft

What does a croft mean to the Gaelic? In terms of everyday economics, there can be no simple answer. For a few, probably no more than fifty families, the sale of cattle, sheep, and wool provides an ample income. The families are able to obtain the necessities of life and enjoy a comparatively high standard of living. The majority live on crofts which cannot begin to support a solitary individual. Expecting little more

[7] T. Fraser Darling, G. C. Hayes, and Averil Worley, "The Agricultural Situation," The West Highland Survey, F. F. Darling et al. (mimeographed, 1952), Part V, pp. 1-13.

[8] Ibid.

stock grown for local household consumption and export but also the subsidies and grants provided by the national government. I hesitate to add that it is impossible to estimate accurately the specific contribution of crofting to the economy of Skye. There is no available means of distinguishing the status of crofter from that of farmer in the annual returns of crops and stock or in the applications of farmers and crofters for subsidies and grants. Before getting down to pounds and shillings, we say find a brief digression to review the acreages of land devoted to crop and stock raising and the yields to be expected helpful in our attempt to understand the many problems under which the Skyemen labors.

The total area of Skye is approximately 447,000 acres. Of this area, 422,412 acres were classified, in 1953, as rough grazing.[7] The land under cultivation, excluding grasses, was only 3,254 acres. There were 6,258 acres of grass intended for use as hay and 12,339 acres of permanent grass or improved pasture. The remainder, about 2,500 acres, was unclassified.

The stock, in 1953, was 1608 dairy cows and heifers, 8,108 cattle, 143,422 sheep, 41,888 fowls, 436 horses, and 319 pigs.[8] The dairy cows are mainly beef breeds which give a low yield of milk. The sheep are primarily the hardy blackface variety but some crofters have cheviots, which produce a finer wool. For each sheep there are about three acres of grazing

[7] Agricultural Returns, June 4, 1953, Department of Agriculture for Scotland, Edinburgh, Scotland (in the files of the Department). These figures include adjacent small isles.

[8] Ibid.

If May is considered a busy month, June duties are even more pressing. Although the winter sales are over, the rainfall has begun to increase. A succession and variety of demands are made on the crofter's time. Once again the sheep must be brought down to the "fank." This time the purpose is to mark the lambs. The males, unless one or two healthy specimens are selected for future use as rams, are castrated and smeared with a dye to indicate their ownership. The females are smeared and have their ears cut to signify both ownership and age. Like the dipping, this operation requires the cooperation of the crofter and his family, the neighbors, and hired hands. Next the sheep without lambs are dipped once again and given a dose of medicine for liver flukes and a variety of diseases. At the same time, the early hay and, perhaps, the early potatoes are ready for harvesting. The end of June brings the Highland Wool Fair in Inverness. If he has Cheviot sheep, as most crofters do, the man must go to arrange for their wintering on the milder and drier east coast. Although Cheviots produce a finer wool than the more common Blackface sheep, they do not stand up to the incessant wind and rain of a Skye winter. If his wife can leave the children behind, she will accompany her husband. The old function of the Fair, the sale of wool, has disappeared under government price control legislation.

It is not unusual to take the early harvest delayed until July, but even then the mowing may have to wait because the sheep must come first. On one of the dry days during the first

wool must be packed for shipment. As November ends the rams are put out with the flock.

Winter is a slow season for men, but it is not an idle season. The cattle must be fed. The man fetches oats or hay from his stacks and some turnips or potatoes from his storage pits and carries the feed on his back to his cattle on the hill. Very rarely does he keep them in a byre because to do so he would lose the government subsidy on hill cattle. Although the sheep are now free from pests and most diseases, he must continue to periodically walk the hill to check their condition. Very few bother to feed the sheep in winter. Another task is the butchering of a few sheep. While not quite legal until last year, one crofter justified his activity by asking, "What would we eat if we didn't kill our sheep?" Once in a while, he may also kill a steer, but unless several families share the meat, salt beef becomes rather monotonous.

The crofter's wife keeps busy all winter. Her routine, broken by helping at the fank a half dozen times a year and with the harvest, continues through all seasons. As far as the actual work on the croft goes, she milks the cows, feeds the poultry, and cultivates her garden. When she is not cleaning the house, cooking meals, making butter or cheese, caring for the children, or looking after her husband's needs, she knits. She also does the shopping, either from a food van or on a weekly visit to Portree. Men are as disinclined to shop as they are to wash dishes.

GROUND PLANS OF SHIELINGS

Fig. 10

/facing p. 39/

Table XIX summarises the population structure and trends for the four districts. It is significa that the two districts without service centres, which provide a range of ancillary employment, have experienced more severe depopulation since 1939. This table also underlines the fact that earnings from seasonal employment are insufficient: the incidence of permanent employment furth of the districts is three times as great as the incidence of seasonal employment.

APPENDIX B

SHIELINGS - A NOTE

John E. Wearmouth with illustrations by Beth Blowers

From Figure 1, compiled from the First Edition six-inch map of the Ordnance Survey (1850 to 1852) and from personal observations, it is clear that the shieling system was at one time an overall feature of Park for the whole peninsula has traces of this transhumant economy.

The rudimentary structures, some of turf, others of stones and roofed with bracken or heather thatch, are all sited on well drained sites, the majority on mounds. Almost all the sites are close to lochs or streams. The majority are in loose groups of from two to nine buildings, although there are some in isolation; no site has as many as twenty-six buildings as found at Airidh na Gaoithe in North Uist.

There appears to be two distinctive shapes of building - oval and rectangular (Fig.10). All shielings measured exhibited a remarkable similarity in dimensions, from 17½ by 9 feet to 13 by 12 feet. The oval structures are generally larger than the rectangular ones. Most of the shielings had two entrances, often, but not always, opposite each other.

The shieling system died out in Park about 1880 but the cattle continued to graze around the shielings on the better grass, and the crofters had still to go out to milk the cattle at the shieling, although they no longer lived there. The sheep still use the mounds for shelter and grazing. These features of an obsolete economy are still easily recognisable from the luxuriant grass cover in a wilderness of peat bog and bare rock.

APPENDIX C

NORSE SETTLEMENTS NAMES IN NORTHERN PARK, LEWIS

Bridget M. Gordon, B.A., B.Litt.

See: Magne Oftedal, The Village Names of Lewis in the Outer Hebrides; in Norsk Tidskrift for Sprogvidenskap, vol. XVII, 1954, (Oslo), pp. 363 ff.

Professor Oftedal points out the difficulties of these Norse-Gaelic settlement names: inaccurate spellings even in modern times, and lack of any useful evidence from older sources, make almost all the derivations a matter of conjecture. Sometimes two or more ON equivalents are possible (e.g. for Calbost), sometimes no satisfactory solution can be found (e.g. for Lemreway). Since Professor Oftedal frequently bases his explanation on pronunciations not recorded in written forms, his evidence is largely followed here.
SHIELDERNISH: the second element is N nes, 'headland'. Oftedal's explanation of the first as silda, genitive plural of N síld, 'herring', is satisfactory linguistically, but seems unlikely in meaning.

Recent trends also point to a decline in the numbers of sheep, although more are kept now than teen years ago. From 1942-51 the numbers were more than doubled (263-565). A great deal of is increase must have been a result of the ewe subsidy, but part at least may be connected with e war and post-war boom in Harris tweed. By 1955, when the subsidy was suspended, numbers d already begun to decline and have since fallen steadily. This year the township has only 374 eeding ewes while the rearing of only 236 lambs would suggest a further decrease in the future.

All the crofters keep some sheep although individual stocks vary from 15 to 150. For most of e year these sheep are grazed on the common pasture on the moor or on the eighteen acre island the bay. In August, however, the lambs are gathered in for weaning and dipping; in November e gates are opened and all the sheep allowed to graze on the cleaner pasture within the croft undaries. If necessary they are given fodder, but from the beginning of January they are encoura- d to return to the moor, although the gates are not 'officially' closed until May.

The total area of the common pasture exceeds 1500 acres, but most of this consists of hummocky, terlogged peat moorland supporting only poor quality coarse grasses and sedges. Over 700 eep now graze this area and the apparently large common pasture is in reality drastically over- ocked, a process which must inevitably harm the animals as well as the land.

No pigs or horses are to be found in the township and each crofter keeps very few hens, normally st sufficient to provide eggs for home consumption. Any surplus eggs which do remain are sold the Co-operative van, but prices are so low that the keeping of more than a dozen hens is far om profitable.

It can be appreciated that crofts of this size and quality can neither provide the crofter and his mily with sufficient income, nor fully occupy the available labour force. As a result, people the past have turned to the sea. Indeed the West Highland Survey describes Orinsay as "primarily fishing township". Today the herring fishing has disappeared entirely and only one crofter still es a little lobster fishing, sending his catch direct to Billingsgate.

There are now 45 people resident in Orinsay but an examination of their ages reveals that less an half of them are between 15 and 64 years. Indeed there are only six resident males between ese ages, and three of these spend at least part of their time working away from the township on e Eishken estate.

As there is neither a school, post office, shop nor garage in Orinsay, there is no available cupation in the 'service trades'. Therefore, over half of the males between the ages of 15 and 44 e permanently away in the Merchant Navy, returning home only for holidays, while another third e seasonally away with the whalers. Similarly almost half of the females of similar age work in omestic service in Glasgow. It must be realised that most of these people working away assist eir families at home, and that a large part of the croft incomes are made up of money sent home, gether with pensions and other allowances. Emigration from Orinsay to other areas has continued eadily, twenty people leaving the township since the war.

On the whole, housing conditions are good, due to relatively recent construction. There is ly one traditional black-house, and even this house has electricity: only one house is without it. ater supply is not so certain as wells and springs are the only source. The township lacks a lephone and a shop, but is served by travelling vans. A good road, constructed within the last ecade, connects Orinsay with Gravir; entering the township via the valley to the north-east, it rves directly all but three of the crofts. A bus leaves daily for Stornoway, about thirty miles stant.

Like so many other crofting townships Orinsay, above all else, gives an impression of con- estion. The self-same hills that provide shelter also restrict cultivation. The crux of the tuation is that land, extremely marginal in character, is being worked by too many tenants on oldings too small to be economic. With three residents to every two acres of cultivated land, rinsay must be seen as an 'overspill' - an unfortunate result of the cottar problem in the 'twenties'.

[Orinsay]

The future existence of the common pasture for grazing is being seriously endangered by overstocking. The souming is not enforced in Orinsay and the actual sheep stock exceeds the soum by 300 per cent. Peat-cutting is gradually destroying valuable grazing areas; in the last three years there has even been some peat cutting on the better grazing on the island. The dangers both of overstocking and of indiscriminate peat cutting cannot be overstressed.

No evidence was seen of attempts to improve the quality of the common pasture. The establishment of shelter belts would provide not only shelter but a means of stopping the peat from 'slumping' down slopes if they were carefully sited. Much of the common pasture could be improved by a hill drainage scheme and by re-seeding, after sanding and liming, a project well within the capacity of the resident labour force.

Good crops on a few of the crofts suggest that the land is not inherently sterile, however, and it would seem that if the holdings were reduced to a maximum of four, an economic existence might be feasible on these crofts. The stony nature of the soil limits the possibilities of tractor cultivation, but with an improvement in drainage, one might be used in the two valleys.

It is not so easy to be optimistic about the employment of surplus population resulting from such an enlargement of holdings, although a revival in the fishing industry could absorb most of the men. A present there are no looms in Orinsay and providing the Harris tweed industry can hold its own, there are possibilities in weaving. Seaweed is in plentiful supply, indeed Lemreway people also obtain supplies and should its quality prove adequate, the establishment of a processing plant would provide valuable employment.

Nevertheless it is becoming increasingly obvious that unless the holdings can be enlarged, whether officially or by sub-letting, and some further employment created, Orinsay is liable to stagnate, and depopulation to continue. The township which was developed to relieve congestion is now itself congested.

SUMMARY AND CONCLUSIONS

The aim of the Glasgow University Department of Geography Crofting Survey is to record and analyse material relevant to the crofting districts, and in so doing provide a clear and impartial statement of the present situation. In inviting us to undertake a survey of Park, the Pairc Association hoped that a body of fact would be assembled and conclusions drawn which would assist the Association in their admirable aims of advancing the well-being of the area. Their two Progress Reports, of 1956 and 1957, indicate that they have already investigated many of the possibilities for development. This summary refers to Park alone, and, it must be emphasised that until the survey of crofting is completed, no final assessment of the Crofting Area as a whole can be made.

The district of Park is one of the more isolated and difficult crofting environments. The ruggedne of the terrain, the high proportion of land of very low agricultural value and sheer isolation make the existence of human communities precarious. In addition, many of the Park communities were first established as a result of population pressure in more favourable areas of Lewis, and the original small settlements grew rapidly as a result of a change in land use which was a national trend - the conversion of poorer areas from subsistence farming to an extensive sheep-rearing economy. The impact of this change came to Park in the form of the eviction of a large body of small farmers in favour of an extension of the grazing area. Thus the present conditions are a legacy of the relatively recent past, and of legislation, particularly in the Crofters' Act of 1886, which accepted, and tacitly agreed to the maintenance of a larger population than the land could reasonable carry[1]. Two World Wars and fluctuating economic factors have had repercussions in Park and resulted in a change in economic and social values, and depopulation has resulted: the 1951 population was 60 per cent of the 1911 total.

1. The Commissioners proposed that only holdings rented at £6 and over should have security of tenure, with a view to discouraging the perpetuation of grossly uneconomic holdings; in the Act, all holdings were given security of tenure.

[136] belief. Since agriculture is a poor risk in the best of years,
[137] the present tendency to use more and more of the land for grass
[138] and hay can be regarded as a more complete adjustment to the
environment. The partial involvement in the outside contractual
world encouraged and made possible the change. The mass
reasoning applies to stock production, including the declining
number of horses, cattle, and, especially, dairy cows. The
exports, obviously, reflect market demands. A couple of
[142] crofters have unsuccessfully tried market gardening. The
Kristabaugh is not a vegetable eater, and the commercial
establishments, apparently, find a more dependable supply
[144] elsewhere. A few crofters do sell potatoes in Portree, but
[145] they will not compete with the large, east coast potato
[146] farmer. In 1953, as soon as the price fell below the pre-
season high, the crofters decided it was not worth the trouble
[147] to dig the tubers for sale. The same held true for eggs.
[148] Many crofters barter eggs with the food vans which serve the
[149] rural areas for tea and meat. When the Scottish market was
glutted in the summer of 1953, the crofters refused to trade
at lower prices. They preferred to obtain their protein from
the eggs, believing that the spring egg prices were the fair
prices. For the sake of emphasis, I repeat, the involvement
[154] of the Kristabaugh in the world of commerce is only partial.
Finally, in accounting for these changing economic trends,
the aged and the absentee crofter must be taken into account.
[157] The old people frequently cannot work their crofts or
[158] cannot use them fully. The age at which the work becomes too

[233] usually an old woman, as the women were responsible for
[887] the milking, and the old men were usually fishing around
[462] the village.

[233] "We left for the shelling early in the morning,
[512] taking bed clothes and food. I walked out with my aunt,
who went back home in the morning. My mother came out
with the provisions in the evening. If no one came out
[513] that day, I went to sleep with someone else. You never
slept alone. During the day we fished for trout or
gathered small blackberries; or we looked for the nests
of grouse and other birds. You would knit or read, and
walk for miles to visit friends. The boys swam in the
loch, and sometimes the girls pinched their clothes.
From the top of the hills you could see Stornoway, the
hills of Lochs, Uig and the lighthouse in Ness; on some
days you could see the distant hills of Caithness on the
mainland. It's on the shelling that I learned about
other parts of the island.

"I remember watching the sun and trying to will it
[512] to stay high in the sky, before our mothers came out from
[233] the village to milk in the evening. They called the
[234] cattle--'Troit, troit, troit'--and they carried the milk
every day from the shelling to the village, all those
miles. The cattle knew their own shellings; sometimes

[512] the cattle
[233] knew their own shellings; sometimes
[235] they came back before milking time and stuck their heads
[233] inside. They stood outside the shelling at night, and
that's how you can tell where a shelling once was, even
though the walls have fallen, by the rich green grass.
Calves were born during the summer. A hollow was scooped
[233] out in the peat, and lined with turf and moss. People
[422] had as many as four or five cows. It was like Switzerland,
only we didn't have the bells on the cows. There was lots
[192] of milk, fresh thick cream and crowdie (clotted sour
[242] milk); the old people knew how to make cheese.
[234]

[233] "The moor was very eerie at night, with the sound of
[221] the birds. There were only a few hours of darkness
[238] anyway, and I'm sure we didn't get much sleep, but somehow
[513] we were always fresh. It was the air, the moor air is
more health-giving. The air is different there. Ill
people benefited from the change. Sometimes a person
with TB would stay out there all summer. The air is heavy
by the sea.

[805] "There was no sense of time the way there is today.
[233] If you got lost in the snow or fog, you followed the cows
[231] home. You had all summer to take home the peats, to work
[239] the croft, to harvest the corn. There wasn't a world,
[78] there was only ourselves. That has changed since the war.

[233] "You got away from village life when you went to
[239] the shelling. The youngsters ran wild. Everyone talked
more freely somehow. It didn't feel like a Sunday out
[233] there--the minister couldn't see that far. Only the
[233] young men and women in their late teens or 20's were out
at the weekends. They would send the younger ones home.
They came out in their good clothes, from Saturday night
to Monday morning. Groups of young people walked out and
[192] brought back the girls in one group and the boys in
[242] another, joking and teasing. They sang the old songs and
[533] learned new ones from each other. Some were good at
making up songs. You wouldn't believe how many people
could sleep together in a single shelling. It was a
[829] heaven on earth. Everybody was one family. The hills
were filled with the sound of voices."

[233] Not every family in the village went to the shellings.
Some families had enough land within the township to graze
their cattle. But they usually went out at the weekends,
for the fun and company.

[237] One of the most important products of the cow was
[241] not milk but dung, which was used to keep the poor land
productive. Because people did not have the enriched
[233] animal feeds available today, a cow might not have a calf,
[234] and thus did not give milk, for four or five years.

[231] People kept several cattle, some of which were dry most
[234] of the time. But because everyone was keeping cattle,
[244] milk could be gotten from a neighbor. One man was
[244] planting eight or nine hundredweights of potatoes before
the war, some of which would be used to feed the livestock.
[511] "You couldn't buy milk then, so you had to keep a cow.
[239] And even though people were weaving, they weren't getting
[231] so much money as they are now. It was the barter system
[239] here for a long time. So they didn't have the money to
[237] buy feeding stuff. It was better to spend the time
[194] planting potatoes. Now of course there's more money in
the weaving."

[175] After the war, an act was passed which provided free
[172] milk for schoolchildren. Milk for the Shawbost school
[244] was supplied by a farm near Stornoway, and villagers first
[192] started buying the milk from the school milk van. A strike
[175] held by weavers during the war had increased the payments
[176] for weaving, and the barter system had stopped. More
[228] money was available. As the loom was more profitable,
[243] more people stopped keeping cows, and relied on their
[237] neighbors for milk, or got their milk from the van bringing
[231] milk to the school. And as the cattle got fewer, the
[198] market for bottled milk expanded. A dairy was started on
[231] the west side of the island in the mid-1950's which carries
[254] milk from Uig to Ness.

[178] The number of cattle diminished as milk became
[231] available by other means; and when the township reseeding
[233] schemes came into existence, the need to go to the
[175] shellings for an "early bite" was removed. The shellings
[242] that remain in use today are huts of tin, wood and
concrete within easy walking distance from the highway,
used on weekends and during summer holidays. Most of
these modern shellings are close to Stornoway, and serve
as summer retreats for the relatively married urban
[194] dwellers such as publicans. On the west side, the
shellings are no longer used, but remain as a theme of
songs and in nostalgic memories.

G. The Loom

[175] Clo Mor, the big cloth, was woven in the Highlands
[226] and Islands for hundreds of years. Martin Martin,
who travelled through the Outer Hebrides in the late 17th
century, describes the export of "plaiding," and the
practice of washing or shrinking the woven length of
cloth (Martin 1716). Weaving was done on wooden looms,
and produced only for local markets until the middle of
the 19th century.

[121] By the middle of the 19th century, the failure of
[195] the kelp industry, decline of fishing, and destruction

[175] During a huge snow-fall that occurred on 126
[26] Lands in the 1950's, the mobile grocery vans and other
[132] supply vehicles could not come out to the west side,
[143] and a group of men had to make an expedition into town
for provisions, after which many families made certain
that they always had a good supply of meal, salted
mackerel and herring. Many villagers have gotten deep
[144] freezers to store beef and mutton; others say they do
[145] not trust the freezers, that a failure in electricity--
which occasionally happens in this region of gales and
far-away repairmen--would bring disaster if they depended
[45] fully on them for keeping their meat. When the tweed
[226] industry is going through one of its periodic depressions,
more men go out more often to fish. "I've been going
out every night for the last week or so. I don't have
a tweed, and I won't have one for the next six weeks.
I don't know what I'm going to do; maybe I'll go back to
sea. Three of us caught one hundred mackerel last
[251] night. I salted my share, and didn't give any of them
away. These are the hard times. We're going to need
them during the next six weeks."

[233] A few people raise beef cattle, depending largely
[234] on subsidies for encouragement to do so. A few are
[234] beginning to keep cows again for milk, giving as their
[192] reasons that freight charges make the bottled milk too
[243] [243] [248]

costly, that the Common Market will soon drive up milk prices, and that income from the weaving has become too uncertain.

Many tools and techniques associated with crofting have disappeared: the flail for threshing oats (two pieces of wood joined with leather); the sheepskin stretched over wood with holes burned into it, to separate chaff and grain; rope made of plaited heather and straw. Each spring the byre was cleaned of its accumulated dung and urine, and this was turned into the ground along with seaweed. Such tools and techniques remain among the older villagers as a "memory culture" which may be mobilised under changed conditions, as when alternatives to crofting are no longer available or are too costly. However, the longer crofting is neglected, the less it will provide an alternative strategy. "The artificial fertilisers are ruining the land; that's why the turnips are full of maggots and the potatoes turn to water." As the rushes grow and clog the drains and streams—rushes that used to be eaten by the horses and cattle and which are now left untouched by the sheep—the land becomes unfit even for grazing. "I'd rather work the land than the blinkin' loon, but we tried the potatoes, turnips and cabbage last year, and lost them all to the maggots. You lose heart after that."

AGRICULTURE AND FISHING

far as the reclamation of arable land from moorland was concerned, however, requiring as it did under-draining and cultivation, the labour costs were heavy, approaching the £20 per acre mark including the liming and fertilizing.

Though the farm was used for dairying with some reasonable results, the moorland acres put into good heart at Arnish were left to deteriorate. The run-down of the experiment followed the depression of 1933. Funds dried up, and in 1939 the farm was let to a tenant. But the lesson obtained from the MacAulay farm was a good one. By simple but hard work, and by using which large quantities are available on the shore-lands, applying some form of phosphate and seeding with cheap clover or ryegrass—involving no cultivation—large areas of moorland can be persuaded to do a good job. The work at present being undertaken by crofters to improve moorland grazing is worth mention. Areas of land have been given a surface application of approved compound fertilizers, phosphates, lime or shell sand, and selected grass-seed mixtures. The results are literally a sight for sore eyes, and bring Alexander Smith's 'green, pastoral land' close to realisation. Although individual crofters have taken advantage of the help given to regenerate rough grazings, the most spectacular results have been seen on the township common grazings; most of these have been fenced off and improved. Today, something like 14,000 acres of lush green pastures are steadily spreading over deep peat where formerly grew only sedges and brown heather.

To end this aspect of land use in Lewis on a historical note, the story of re-seeding had its beginnings during the time of the Napoleonic Wars. A minister who had some land at Barvas, on the west coast of the island, decided to attempt the reclamation of useless heather-bound and bracken-choked land. He sanded the area with shell sand, seeded it with a good strain of grass and sheep to tamp in the seed. One can imagine what Lewis would be like today if the Barvas minister's work had been followed up by Alexander Smith and those who set up the farm at Arnish.

AGRICULTURE AND FISHING

for mutton and for wool, the right type for translation into Harris Tweed; the predominant breed is the blackface, whose fleece is hard, wiry and long-lasting. The demand for raw wool has also encouraged larger flocks among crofters in such places as Barra, where virtually no weaving is done in the immediate locality. In general there has been since 1911 a 40 per cent increase in the livestock carried on the island's crofts, about twice as big a rise as found anywhere in the seven crofting counties of Scotland.

In an attempt to reduce Lewis's milk imports, in 1962 three crofters at Garrabost on the Eye Peninsula combined to set up a small dairy farm using the lands of their three crofts. A new dairy byre and dairy premises were built and equipped with the necessary electrical equipment. Grants were given by the Department of Agriculture & Fisheries for Scotland, the Crofters Commission, and the Highland Fund Limited. The first year of operation was closely supervised by the Lands staff of the Department at Stornoway and guidance given as necessary. The milk is retailed in Stornoway and district and supplied to about 5 per cent of Lewis's daily consumption. This little scheme has shown that the island could with some organised effort become independent of milk imports, which have been estimated at upwards of £100,000 worth per annum. Over £70,000 per annum is also spent on imported butter and cheese.

In 1917 the number of crofts in Harris and Lewis was 4,020. In 1971 the figure was 4,146 (3,592 being in Lewis), representing a slight increase in a quarter of a decade. Thus, crofting as a land use activity in the island provides a fairly stable element in the economy, although it is subsidised by the crofters' participation in the Harris Tweed industry. Other activities, it should be mentioned, is often a tenant of more than one croft, working them together as a unit. These units vary in size, the greatest bulk of them (about 60 per cent) having up to 5 acres of arable land. About 5 per cent contain over 30 acres of arable land. In recent years there have been proposals for the better use of the reclaimed moorland, particularly for cattle-raising, which would offer the crofter an increased cash yield from his interests. The annual reports of the Crofters Commission indicate, indeed, that the trend to the small croft obtained from the fragmentation

A HARRIS VIGNETTE

HARRIS'S OFFSHORE ISLANDS

Scarp

Until 1972 Scarp was the most westerly inhabited island in Scotland, separated from the Harris mainland by a strait which is about half a mile wide, and its narrowest, cleared by strong tidal currents. The island is about three miles in diameter, rugged, especially in the north and west, with cliffs on all sides; the maximum altitude is nearly 1,000 ft. On the east side lies a tiny marginal belt of good land, machar and soil; on this green shelf, about one-third of a mile long, were all the crofts of the Scarp settlement. Many stand deserted, and abandoned lazy-beds in sites beyond the present settlement indicate a denser population at one time. The island's population-carrying capacity was severely limited by the paucity of good land available for tillage: of a total of about seven square miles only half a square mile can be used. Climatic conditions and soil type also restrict the range and quality of crops grown.

Scarp originally settled about 1810 and was occupied by eight farming families who were reasonably comfortable. Not only did they have the island to themselves, but they had access to good pasture on the Harris mainland opposite. About 1825 thirteen small townships between the head of Loch Seaforth, Harris, and Bunabhainneader were cleared, some of the displaced families coming to Scarp. Some emigration back to Harris took place in the 1840s, but when about 1868 the proprietor divided Scarp into sixteen crofts instead of the previous eight holdings, these were further divided by the people themselves, trying to accommodate their families and friends from elsewhere. In 1861 the population was 151; the peak was reached in 1881 with 213 persons. In 1951 it was 74. Communication with the Harris mainland is by boat, plying between two stone-built jetties.

The local economy was essentially a subsistence one, with self-sufficiency in such products as potatoes, turnips, cabbages, oats, milk and fish. After a break of some years lobster-fishing has recently been resuscitated as an occupation. Oil lamps are the only lighting, though a few houses have piped water. The small shop

Cattle are kept on 162 of the 219 units; in all there are 180 cows of three years and over, 47 young cattle, and 7 bulls. The usual practice is to mate the cattle, and sell them as cows as they qualify for the calf subsidy, the sale of which—only in one of the reasons for this practice. The breeds of cattle are mainly the black-and-white Aberdeen Angus with a few Highland cattle. The other function of the cow is to provide milk for the crofter's family, and to provide a low cash income on blood sales. The cattle are kept on the twice-yearly market held at Gerrynesk, but prices fluctuate greatly. The township of Park certainly do not carry a full complement of cattle.

Sheep are more important than cattle in the crofting economy in Park. The breed is the Lewis Blackface; a small, lighter type of the Scottish Blackface breed. The sheep are pastured on the common grazings in summer, and are grazed on the croft land in winter. The standard of the sheep is not high, and the crofters do not generally pay much attention to breeding, the priority so all stocks mingle freely on the commons. The lambing percentages for 1958 was about 90 per cent, the amount surviving to August compared to the total ewes stock was 54 per cent, and the lambing percentage for the year 1958 was 2 per year. A further indication of the quality of the sheep is that the average fleece weight was 3½ ounces, and the average sale price was 18 shillings. The sheep are kept for wool, for lambs, for mutton and for sale, and prices can be partly ascribed to the lack of good grazing and to overgrazing. The sheep are kept on the common grazings in summer, and are given a special ration of concentrates to accustom them to the unfamiliar food. The sheep are kept on the crofts in winter

e who do not do their full share. 000

The year for the part-time crofter begins with the prepa- 221 241
on of his fields. As a general rule both the man who spends
winter working for the British Railways or away at sea, and
one who finds summer employment near home is found on his
t during this period. Following the example of the large
ter some use a tractor while others continue to plough by
e. More and more are tending to take advantage of the con-
ting service of the Department of Agriculture and hire a
tor and driver. Once the crops are in, the majority are
until the lambing season. Conservative in his belief 221 233 [232]
too much handling of the sheep is harmful or individually
d with the almost prohibitive task of singling a small
k out of several hundred sheep, he tends to omit the March
ing. During the lambing season, the several crofters of [474]
township either take turns on the hill or hire a shepherd.
first chore, then, which brings them together as a group
he marking of the lambs and the first dipping of the sheep
out lambs. The July shearing and the statutory dips in [476]
st and November are cooperative ventures shared by all
ters no matter what size croft they occupy.

In sundry ways, economic interests, judged in terms of 231 432
ercial efficiency, play a smaller part in determining the
omic cycle of the part-time crofter than in the case of the
-time crofter. The part-time crofter does not think it
h while to ship his few head of stock to the mainland
ion markets. He sells them locally at the tri-annual sales.

lambing season, the crofter and his family go out on the moor 221 241 314 [4 12]
to cut their peat for the following winter. The man uses a
"tusker," a two-bladed spade, to cut the peat. His wife or
his children follow behind, tossing the peats out of the ditch
and building small, loose stacks for drying. After the lambs
have been marked and the sheep dipped in June and the shearing
finished in July, the family returns to the banks to carry
the peats to the nearest road, actually a beaten cart path,
in creels. They are then carted home and stacked near the door.
There is a growing tendency for both the part-time and spare- 341 178
time crofter to give up cutting peat. It is not because coal 241 [464]
is cheaper or he needs time for other pressing chores. His
auxiliary occupation will not permit his devoting the necessary
time to this long and arduous task. He is caught between the
traditional economic patterns and the money economy of which
he has become a part.

The year for our part-time crofter, as for all active 221
crofters ends in November. By then the oat and hay harvest has [241] [341] [232] [233]
been stacked by the house and the potatoes and turnips stored
in the ground, the wool shipped off to market, the surplus
sheep and cattle have gone to market, and the rams are on the
hill. Now follows a period of enforced idleness, broken by
feeding the cattle. As we have seen many go away to find [464]
employment, leaving the care of the croft to their wives who [593]
have shared the work of crofting in addition to their own
womanly responsibilities. We must turn to the spare-time [462]
crofter to discover just how heavy the burden of labor may
depend upon the women of Skye.

6: Ducey E-4,5 (1953-1954) 1956 ES10 Highland Scots ES10 Skye

The maximum is harder to determine, economically. There is some limit to the number who can stock a common grazing with individually owned stock without becoming involved in complicated entanglements over right, obligations, and questions of ownership. The few townships containing more than thirty crofts in the Western Highlands (91 out of 957),[13] and the negligible number on Skye (only ten), suggests that less than thirty holdings per township, no matter how much fertile land surrounds the cluster, has been found to be the optimum. Most of the townships contain between five and twenty crofts. The fact that many large, adjacent townships, such as Borneskettaig in Kilmuir and all those in the Braes, are losing their population is a reflection of a many faceted condition we have been exploring throughout this chapter--the vast majority of the crofts are too small to provide an adequate livelihood. One of the primary causes for this state of affairs would seem to be overcrowding on the land.

Congestion. In almost all but the recently established or replanned townships, congestion is a legacy of the increase in population during the first century of the modern period, often aggravated by coerced subdivision during the period of the "Clearances." Because of this, over-all statistics have little meaning. It is quite correct to say there are some 2300 crofts on Skye and approximately 2200 crofters, but this does not mean each family has a croft to itself. To take

[13] Ibid., table 1.

6: Ducey E-4,5 (1953-1954) 1956 ES10 Highland Scots ES10 Skye

Township Government. The township system has another marked influence on the economy of the Sgiathanach. By far the largest obstacle in the path of reform is the persistence of primitive democracy, distinguished from the democracy of Western Civilization by the requirement of unanimous consent rather than majority rule. The individual who comes to realize that it is possible to improve on the ways his father did things is deterred from attempting to introduce innovations. He cannot, for example, erect a fence around his croft unless everyone in his township approves such a departure from tradition. The dissenting voice of one old man is sufficient to thwart any plan. Unanimous decisions on all township affairs mean that the most progressive worker must keep pace with the most conservative. This fact goes a long way in explaining the essential agricultural disharmony of Skye, and most of the Highlands, with the rest of Great Britain. It is also a singular example of the incomplete adaptation of the culture to the higher socio-cultural organization.

When coupled with the many limitations on the economy, township government helps the outsider to understand why many younger crofters feel that the primary value of their few arable acres is their use as pasture. Even in townships which have been fenced, the prevailing practice is to open the crofts after the harvest. All winter long the stock is free to graze where it will. "My arable is no use at all, except to winter my sheep," said one young crofter. Another asserted, "I have three crofts and the use of one more, but it's not

orth while to cultivate any of the arable, so I use it for 626 632
razing." A case which aptly illustrates the influence of 621 233
he township system as an agent of conservatism is the breeding 231
f pigs. Although several old crofters told me how many 779
eople during the times of the "Clearances" kept a pig, they 183 632
re rarely found anywhere in the Highlands today. The Biblical 621 626
njunction against the flesh of swine has been taken literally.
he older people simply have a strong aversion to handling
igs. One man, a very successful cattle and sheep breeder,
ut it this way: "Pigs are filthy brutes. I just don't
ant to touch them -- I never have kept any and never will."
t the same time, there are men who believe that the prices
hese animals bring at the mainland markets more than compen-
ate for the individual's revulsion, especially as long as
he Ministry of Food pays for the cost of transportation.
hese men cannot try branching out because they have no way
o restrict the foraging animals. "Skye is ideal for pigs," one
oung fellow told me, "but I don't have the freedom to work
he croft to suit myself."

Smaller deviations from the traditional methods of land 621
e face the same difficulties. A progressive crofter who 632
tempts to improve the value of his stock by growing scientific 626 232
xtures of grasses is always penalized. As soon as the harvest 241 178
over, the stock of all his neighbors will show their ap-
eciation by concentrating on his croft, trampling his fields,
d overgrazing his grass. Nor is this his only penalty. His
ighbors will regard him with skepticism for his departure
rom the ways handed down from the past.

the economy by subjecting many fertile acres to disuse because of his infirmity. The other factor is the absentee tenant, an individual who has obtained possession of a croft, normally by inheritance, but who has failed to take up his inalienable rights of tenancy. Let us very briefly review the economic trends of the last fifty odd years and, then, try to assess the importance of the absent and the aged.

Although the Sgiathanach has refused to become a specialist, fully involved in a money economy, he has become increasingly dependent on the products of the wider commercial society. Long ago he gave up growing the old staples, barley and oats. Not for many years has he grown enough potatoes or turnips to feed himself and his cattle. In place of these home grown subsistence crops, he now imports a great deal of his food. In an average year Skye imports over 700 tons of bread, 10 tons of vegetables, 300 tons of canned goods, 300 tons of potatoes, 500 tons of flour, and 100 tons of milk. To pay for these products, he exports cattle, once his only marketable produce, and an ever increasing number of sheep.

Hance, writing about the Outer Hebrides, sees the growing tendency of the crofters to buy their food as indicative of an increasing cash income.[16] To a certain extent, this may be true. There are, however, additional factors involved. Ecological limitations have played their role. That the climate and soil together make Skye a grassland suitable for stock breeding rather than an island fit for cultivation is an often repeated

---

[16] Hance, The Outer Hebrides in Relation to Highland Depopulation, p. 82.

233 hundred and thirteen - but most crofters had from forty-five to one hundred and twenty. Wedders are sold at two-three years old when the mutton is said to be at its best.

231 Parts of the common pasture - usually the machair, are set aside for wintering hogg
but the usual practice is to keep as many as possible on the croft. The soum as a whole
[42] is not enforced but shares in the wintering parks are adhered to. For example:- Timsga
Glebe is leased to Crowlista and one share entitles a crofter to winter twenty-five hogg
on it. In Ardroil one share allows one cow or four yearlings or eight sheep or eight hogg
[232] on the machair - in practice it is the best hoggs that are sent. The minister at Timsgarr
who is much interested in sheep husbandry, has bred a heavier sheep with longer legs by
crossing the Hebridean blackface with Swaledales and these seem to be doing very well;
the minister is more attentive to his sheep than are many of the crofters, but some local
crofters are showing interest in this crossbreed. The lambing percentage, so dependant
upon the winter and spring weather, was about 80% in 1959 and this was regarded as good.

Enquiries show that some crofts in each township far exceed their souming but because others carry no stock the four townships are understocked according to the total soum, here expressed in cow units. Sheep stocks in Timsgarry approximate to the sheep soum, Crowlista is overstocked by 130%, while the other townships are understocked.
[23] Some of the figures used for sheep stock were approximate or estimated. Nearly all cro
keep some poultry and surplus eggs may be sold to the grocery vans.

The rhythm of work on the croft during the year is shown on Figure 16, overleaf.[1]

241 Part of the hill common west of Crowlista was cultivated until the beginning of the
175 present century, at which time the township was overcrowded with two or three houses on
[361] each croft. A similar area west of Carnish was cultivated and old lazy beds, now grazed
are to be seen on slopes south of the road in Ardroil, in the valleys of Amhuinn Thoraghai
and Allt a'Gharaidh and on the Borranish peninsula. The ruined shieling huts for this are
still to be seen around and beyond Loch Suainaval were in use until 1934 - '35. (Figure 5).

464 Ancillary employment is sought by all but nine of the thirty men under sixty-five in
these townships and the wives of two of the 'full-time crofters' have regular employment.
228 There is no commerical fishing by local boats though the Bernera lobster boats are seen
frequently off Uig Bay. The ruined curing house and piers at Crowlista, and the 'port'
shown on the O.S. map near the site of the clachan in Carnish, point to the former
importance of fishing.

288 At present the weaving of Harris tweed from yarn supplied by the Stornoway mills is
more lucrative. There are two looms (plus one other weaver) in Carnish, two in Ardroil
three in Timsgarry and two (plus one other weaver) in Crowlista. All these looms were
in use and two tweeds woven a week bring in a useful income but the supply of weaving is
irregular. The future security of these weavers depends on the prosperity of the Harris
tweed industry.

464 Mitchels's sand and gravel quarry at Carnish provides employment for from three to
916 ten men. Five men from Ardroil and one from Carnish are employed there at present.
712 The Aird R.A.F. station draws most of its civilian employees from Aird Uig but two
377 Ardroil men work there. One Crowlista man is employed at the hydro-electric shceme
466 site at Gisla and this work will last for another year or two. Employers recognise the
particular needs of their crofter employees and 'days off' are allowed for sheep fanks
and other necessary work.

* The minister's ewes gave 103%.

/p. 8-E/

[Caverata]

Each croft is fenced but has a gate giving access to the common grazing, in which each crofter holds an equal share. The township has no specially enclosed area for winter grazing. Breeding ewes and no fixed date exists on which the crofters open their gates for winter grazing. Dipping is not normally brought in for tupping in mid-October and November when crops have been gathered, and lambing takes place in late March or April. After dipping and inoculation with vaccines for black leg, braxy and louping ill, the sheep are put out on the common grazing in the second or third week of May.

The 642 acres of common pasture support a sheep stock equal to the sheep roum, but the overall stocking is only 88 per cent of the total souming. Two crofts only exceed their individual soums, while the others are well below the number required for greatest efficiency. The grazing is poor for summer pasture, owing to the lack of grass, but the heather is valuable for wintering the stoggs. Lewis Blackface sheep are the predominant breed and the wool, clipped in July, is sold to the Stornoway mills and the animals themselves are sent to the slaughter house. The 1958 lost at lambing was exceptionally high owing to a cold, dry spring preventing the growth of grass for the ewes. More than forty lambs and thirty ewes were lost by the township last winter, a number four or five times greater than the average loss.

Six cows, two heifers and four calves are kept in the township and tethered most of the year on the crofts. Calves are born throughout the summer months, but whereas early-born calves may be sold in the Autumn at six months old, those born later must be wintered to eight months until the Spring sales. The cows are served by the Department of Agriculture Highland bull at Habost, but although good prices are obtained for best cattle, it is felt that for the family milk supply, a dairy bull would produce a better strain.

In addition to keeping stock, oats are cultivated on five holdings and potatoes on six. In most cases the land under each crop is less than half an acre and nowhere does it exceed two acres. The land has been built up into laybeds about six to ten feet wide, separated by open drainage channels and worked by the spade. There are only two holdings where a tractor (hired from Habost) is used and the acreage cultivated only amounts to three-quarters of an acre. Conditions are not altogether suitable for mechanisation at present, for the terrain is very uneven and broken up by marsh and steep faces of bare rock.

Neither Toristu nor Caverata is on a main road. The former is served by a track joining the road near Crossbost. While the latter has a secondary road running as far as the township dyke, and an inferior footpath joining the main road at Garryard. The lack of a good road within the dyke acts as a deterrent to the use of modern equipment and fertilisers. Byre manure is used on all the crofts and seaweed is brought from the shore and spread on the laybeds. Artificial manures, used on only three crofts, must be carried over rough ground from the dyke. This lack of incentive to improve is perhaps even more marked by the fact that on one holding alone is a rotation of crops practised - potatoes, oats undersown with clover, then hay for three or four years. Apart from this one instance, potatoes and oats are sown, perhaps alternately, on the same strips for many years. Natural grass yields the bulk of the hay and is often cut from laybeds that were formerly cultivated. On one croft there is upwards of quarter of an acre where the old ridges can be seen to have a crescentic shape and are thought to date back more than one hundred years. A short distance beyond the township dyke is a similar stretch of land, now colonised by heather.

Peat still forms the principal fuel and, apart from one half acre patch within the dyke, is cut on the common grazing, as near the road as possible in May and June, and later brought home by creel, bicycle or tractor. Three of the six operative units still have gardens and all keep up to twenty chickens; rowing boats for line fishing, solely to supplement the larder,are also maintained.

In 1841 population records show that there were twenty-two persons at Caverata and seven at Toristu. After 1881, when maximum figures of fifty-nine and nineteen were noted, there was a secondary peak in 1911 in Caverata, followed by a steady drop to twenty in 1951 and eighteen in 1958.

[Marivig]

There are only fifteen cows, two yearlings and four calves in the township, the crofters with no cow rely on neighbours, or on tins, for their milk supply. All but two of the crofters keep sheep, there being four hundred and eleven ewes, one hundred and eighty-five ewes and two hundred and thirty-four lambs belonging to the township. The common grazing (including the off-shore islands which are grazed by five different crofters each year) is used for the sheep in summer, while all but one of the crofters winter their sheep within the township dyke on the crofts. Most crofters keep hens, and surplus eggs are sold to the Stornoway vans.

Peats cut on the common are transported by lorry to the crofts, while peats from the north end of the peninsula separating Loch Marivig from the sea must be carried in creels.

Nearly every crofter owns a rowing dinghy which is moored in the loch off the end of the croft, and with this supplements the family food supply. One herring boat, operating nightly from Stornoway and returning to Marivig at weekends, is all that is left of a fairly large fleet which operated before the war. A second boat, unused for two years, lies sheared up on the beach, and two others are wrecks. Over fifty years ago there was a curing station at Marivig. One crofter fishes lobsters during the winter and markets them in London.

Of the other crofters, only two supplement their incomes by weaving, one by working on the roads while several men work partly on the crofts but are periodically away whaling in South Georgia, fishing, or on hydro-electric schemes. Several others are in the Merchant Navy. The gradual migration from Marivig, especially of the young people, is reflected in the high average age of the permanent residents, and in the numbers in the school -over one hundred pupils in 1950, thirty-nine (including sixteen from Calbost) in 1946; but only nine (none from Calbost) in 1958. The young people leave the township to train or work on the mainland (generally in Glasgow) or in Stornoway, while their elders accept the view that "there is nothing for the young people here".

The township has a Post Office and telephone kiosk which also serve Calbost, while lack of a shop is partially compensated by a choice of four vans from Stornoway and one from Gravir. There is a daily bus from Gravir via Marivig to Stornoway and back: the return is over 10/-. The road which reached the township from the west in the late 1920's has a tarred surface and is much better than the later road southwards to Gravir which is unmarred. There is no church in Marivig and most of the population attend the Free Church in Gravir.

Within the township the two arms of the township road serve all but two of the crofts and the sites of the newer houses, few of them more than thirty years old, tend to be near the road, while the ruined houses found on most crofts are often nearer the sea. Only two thatched houses remain and the other inhabited houses are built of stone covered with asbestos slate, or of corrugated iron. All the crofts are supplied with electricity from the grid, but very few have a piped water supply; rainwater is collected from the roofs and piped for washing, with a separate piped supply from a well for drinking. All other houses draw water from wells.

The stormy winter weather, rocky terrain and poor soil are all blamed by the residents for the drift of population away from the crofts, but those who remain have little incentive to work the crofts more efficiently owing to the very hard labour involved. It is suggested that with more intensive cropping and more cattle, each croft could make a comfortable profit and surplus remain. Potatoes and eggs could be marketed in Stornoway - if with refrigerated transport - and surplus meat from the mainland. Such developments, perhaps on a co-operative basis, together with a revival of the fishing industry and introduction of a tourist industry, by building a small hotel or guest house and attracting anglers as well as those who simply wanted scenic beauty, might bring prosperity back to a township which otherwise may well be derelict in the next twenty years. But the capital required for the two latter enterprises is not available within the township.

Recent trends also point to a decline in the numbers of sheep, although more are kept now than fifteen years ago. From 1942-51 the numbers were more than doubled (243-565). A great deal of this increase must have been a result of the ewe subsidy, but part at least may be connected with the war and post-war boom in Harris tweed. By 1955, when the subsidy was suspended, numbers had already begun to decline and have since fallen steadily. This year the township has only 374 breeding ewes while the rearing of only 236 lambs would suggest a further decrease in the future.

All the crofters keep some sheep although individual stocks vary from 15 to 150. For most of the year these sheep are grazed on the common pasture on the moor or on the eighteen acre island in the bay. In August, however, the lambs are gathered in for weaning and dipping; in November the gates are opened and all the sheep allowed to graze on the closer pasture within the croft boundaries. If necessary they are given fodder, but from the beginning of January they are encouraged to return to the moor, although the gates are not 'officially' closed until May.

The total area of the common pasture exceeds 1500 acres, but most of this consists of hummocky, waterlogged peat moorland supporting only poor quality coarse grasses and sedges. Over 700 sheep now graze this area and the apparently large common pasture is in reality drastically overstocked, a process which must inevitably harm the animals as well as the land.

No pigs or horses are to be found in the township and each crofter keeps very few hens, normally not sufficient to provide eggs for home consumption. Any surplus eggs which do remain are sold to the Co-operative van, but prices are so low that the keeping of more than a dozen hens is far from profitable.

It can be appreciated that crofts of this size and quality can neither provide the crofter and his family with sufficient income, nor fully occupy the available labour force. As a result, people in the past have turned to the sea. Indeed the West Highland Survey describes Orinsay as "primarily a fishing township". Today the herring fishing has disappeared entirely and only one crofter still does a little lobster fishing, sending his catch direct to Billingsgate.

There are now 65 people resident in Orinsay but an examination of their ages reveals that less than half of them are between 15 and 64 years. Indeed there are only six resident males between the ages, and three of these spend at least part of their time working away from the township on the Eishken estate.

As there is neither a school, post office, shop nor garage in Orinsay, there is no available occupation in the 'local trades'. Therefore, over half of the males between the ages of 15 and 64 are permanently away in the Merchant Navy, returning home only for holidays, while another third are seasonally away with the whalers. Similarly almost half of the females of similar age work in domestic service in Glasgow. It must be realised that most of these people working away assist their families at home, and that a large part of the croft incomes are made up of money sent home, together with pensions and other allowances. Emigration from Orinsay to other areas has continued steadily, twenty people leaving the township since the war.

On the whole, housing conditions are good, due to relatively recent construction. There is only one traditional black-house, and even this house has electricity; only one house is without it. Water supply is not so certain as wells and springs are the only source. The township has a telephone and a shop, but is served by travelling vans. A good road, constructed within the last decade, connects Orinsay with Gravir; entering the township via the valley to the north-east, it serves directly all but three of the crofts. A bus leaves daily for Stornoway, about thirty miles distance beyond.

Like so many other crofting townships Orinsay, above all else, gives an impression of congestion. The self-same bills that provide shelter also restrict crofting, the crux of the situation is that land, extremely marginalin character, is heavily worked by too many tenants on holdings too small to be economic. With three residents to every two acres of cultivable land, Orinsay must be seen as an 'overspill' - an unfortunate result of the cottar problem in the 'twenties'.

/p. 35/

436 belief. Since agriculture is a poor risk in the best of years,
241 the present tendency to use more and more of the land for grass
233
439 and hay can be regarded as a more complete adjustment to the environment. The partial involvement in the outside contractual world encouraged and made possible the change. The same reasoning applies to stock production, including the declining number of horses, cattle, and, especially, dairy cows. The exports, obviously, reflect market demands. A couple of
246 crofters have unsuccessfully tried market gardening. The Sgiathanach is not a vegetable eater, and the commercial establishments, apparently, find a more dependable supply
436 elsewhere. A few crofters do sell potatoes in Portree, but
241 they will not compete with the large, east coast potato
432 farmer. In 1953, as soon as the price fell below the pre-season high, the crofters decided it was not worth the trouble
437 to dig the tubers for sale. The same held true for eggs.
436 Many crofters barter eggs with the food vans which serve the
235 rural areas for tea and meat. When the Scottish market was glutted in the summer of 1953, the crofters refused to trade at lower prices. They preferred to obtain their protein from the eggs, believing that the spring egg prices were the fair prices. For the sake of emphasis, I repeat, the involvement of the Sgiathanach in the world of commerce is only partial. Finally, in accounting for these changing economic trends, the aged and the absentee crofter must be taken into account.

The old people frequently cannot work their crofts or
397
241 cannot use them fully. The age at which the work becomes too

236

236 WOOL PRODUCTION--specialised raising of sheep and other animals for wool; dipping; shearing; combing and carding; special equipment and apparatus; personnel and organization; etc. See also:
Textile manufacture . . . . . 38 Tools and apparatus 41

198 purposes, to a community which, as an agricultural
311 entity, requires transfusions from the larger society,
is accompanied by patterns of specialization and
individuation. The following table (Table III) of
agricultural statistics for the parish of Barvas
demonstrates the change, over the past 100 years,
from intensive subsistence agriculture to specialized
production. From a broad-based subsistence use of
the croft (as revealed by the number of acres cultivated
for barley, potatoes and oats; and by the number of
cattle, especially milk cows), there emerges a tendency
[231] toward specialized production. The number of sheep,
• [236] which require less attention than cattle, has increased
241 since the late 1920's when the weaving of Harris Tweed
[246] commenced in earnest; and around this time there also
occurs a differentiation in cultivation, between the
production of barley and potatoes (used largely for human
consumption) and the production of oats (used largely for
feeding livestock). After 1931 agricultural returns
[221] began to distinguish between beef and dairy cattle.
During the past ten years the number of beef cattle in
the parish of Barvas has increased.

241 An important factor which crofters on Lewis now
654 take into account when making decisions about their
[See p.ix--Analyst]

288 developed from the concentration of power in the hands
195 of the merchants. In the early days of the industry,
441 all the processes involved in the production of a
286 finished length of tweed were carried out by individual
• 236 families. A man used wool from his own flock, and with the
438 aid of other family members, dyed it with vegetable dyes,
175 carded and spun it by hand, wove it, washed and shrunk
[386] it, and found his own buyer. Dyeing wool, spinning yarn,
286 and washing ("waulking") the finished length of tweed
236 was usually done by women. In Harris, the entire process
175 of producing a tweed was carried out by women, but in
462 Lewis the weaving was done largely by men.

A woman in her 80's recalls the process of weaving
175 when she was young. Hand-spinning had died out by this
286 time, although the question of whether tweeds woven with
such yarn could legitimately be called Harris Tweed was
not resolved until 1934.

"About 1916 or so it took about two weeks to a month
175 to do a tweed. You bought the wool from the Agricultural
283 Board. Sixteen bags of wool, costing about L20, would
[435] do four tweeds. You needed four one-stone bags per
[433] tweed. Then you would spend a day gathering a bag of
[389] crotal (lichen scraped from rocks and used for dye). One
[824] bag per one bag of wool was required for the dye. After

175 dyeing the wool it was spread out, dried and sent to
283 Stornoway to be made into yarn. The yarn was then sent
175 back, and the weaver wove and washed it. About six women
284 were required to do the waulking (the process by which
[462] the cloth was washed and shrunk).

"In those days the weavers designed their own
175 patterns, and sold their own finished tweeds. I remember
284 going into town with my brother, we had two tweeds in the
432 cart. We went into a shop to sell the tweed, and the man
said it was poor weaving. He didn't want to pay the full
price for it. I told my brother to roll it back up, we
would take it somewhere else. As we left the shop, he
told me I had 'good cheek.' In the next shop the merchant
didn't say anything, and gave my brother the regular
price. We went home with L60."

The great demand for tweed encouraged the development
286 of more efficient methods of production. One by one the
288 various processes of production were taken over by
195 specialists, and gradually these specialists were brought
178 together under one roof. Large boilers for dyeing wool
[433] were supplied as a result of actions taken by the Congested
[434] Districts Board, which was formed in 1897. The Scottish
[463] Home Industries provided chemical dyes. The most
[386] difficult and time-consuming processes were carding and
• 236 spinning, which small mills on the mainland began to do
[283]

286 on commission for weavers around the turn of the century.
288 By the early 1920's, four mills on the island were
195 carding and spinning wool on commission; and one mill
178 brought looms into its premises. Lord Leverhulme, who
• [236] bought Lewis in 1918, saw the value of concentrating
[283] weavers in one place and of improving the technology.
He encouraged the introduction of Hattersley domestic
[463] looms, which eventually replaced the wooden looms. The
individual weaver also did his own warping, but after
World War II the mills began to hire warpers to work full
time on mill premises. Transporting the tweeds, which
used to be the responsibility of the weavers, is now the
responsibility of the mills. Today all processes except
the actual weaving are handled by mills, most of which
are located in Stornoway.

Such steps in specialization and centralization made
195 sense to the weaver. One of the older weavers recalls,
286 "In the late 20's or 30's you could buy a yard of Harris
288 Tweed for about two shillings. It wasn't economical for
435 any crofter to dye and spin the yarn, weave it and sell it
for only two shillings a yard. As the mills enlarged,
they could make it with the machinery because they could
make it an economic proposition."

However, the tendency toward specialization and
195 centralization was in direct conflict with the reasons
286

*159 quietly triumphant yet unassuming way. He does not kill
132 any of his sheep for home consumption.
233

His involvement with the croft is a "hobby" because
*159 its output does not compare with the income he receives
241 from weaving. Whereas he might make as much as L100 from
288 his crofting activities, his income from weaving averages
434 L7-800 a year. As a married man, he can earn as much as
[651] L848 without paying income tax.

found in a warehouse in Leith some years ago; a few found their way back to Stornoway, where one can be seen in the Public Library.

HARRIS TWEED

Today, with kelp long forgotten and fishing of minor importance, it is the Harris Tweed industry which supports many of the island people, either directly or indirectly; an island cottage industry with exports earnings exceeding £2,500,000 a year. Harris Tweed is exported to some thirty countries, including America, Canada, Australia, New Zealand, Japan and all the European nations. The industry is in fact the basis of prosperity in the area, both dependent upon and supporting the crofter-weaver working at the handloom in his home. Seven million yards of tweed are woven annually by the independent weavers 'on the books' of the various mills. The weavers must finance themselves, buying their own looms and bobbins, equipping and maintaining their workshops. Though they receive their supplies of yarn from the mills, they are graded as self-employed persons and as such are not entitled to unemployment benefit—a subject which has caused much argument.

One of the most outstanding facts about the cloth is that its essential qualities have remained unchanged since the industry's early formative years. But it has astonishing versatility and over 5,000 patterns are available, including the crotal browns and the heather colours.

A weaver on average can produce about 2½ webs, or tweeds, each week, a web measuring about 80 yd by 28½ in, and gets a reward of some £8 per web, according to the intricacies of the design or the number of colours involved. The money is paid out by a mobile bank making the rounds of the townships throughout the island. It is reckoned that the mills, for their part, make 1d to 6d a yard profit, depending on turnover; the total annual value of the industry's output is in the region of £4,000,000.

Between them, the five mills in Stornoway and the one in Shawbost consume two-thirds of the Scottish wool clip—the native Western Islands' crop is sufficient for less than a month's production. A thousand pounds of raw wool end up as 885 yards of finished cloth.

finished cloth. About 1,000 workers are employed at the mills, representing about 95 per cent of the island's industry—not counting, of course, the 1,200 or so self-employed weavers. The Shawbost mill, started in 1915 in a very small way, employs about seventy people from the surrounding crofting community on dyeing the wool, carding it and spinning it into yarn, and has about 500 weavers on its books. In 1955 it became a limited company and a £35,000 finishing plant was added; other recent extensions have been made to the tune of £70,000. The establishment of such a large industrial complex in one of the remotest parts of Britain is an achievement to be underlined.

The early cloth industry

Coarse woollen cloth has been made in the Hebrides, as in other rural Highland areas, from time immemorial. Rents were often paid in blankets or plaiding. In 1656, 'pladding' was one of the items of trade brought by Highland boats to Glasgow for sale there. In the late eighteenth century, blackfaced sheep were introduced into the Highlands and islands; the fleece from this breed was much heavier than that of the native sheep and consequently proved ideal raw material for local woollen manufacture for trade. In the Hebrides, the product was mainly for domestic and local consumption. The people of Harris, however, were well known for the excellence of their weaving which found a limited external market. In 1844, the Earl of Dunmore, the first non-native proprietor of Harris, had the Murray tartan copied in tweed by local weavers, so successfully that the Earl and his enterprising wife encouraged improvements in the product and introduced it to their friends. The cloth, ideal for outdoor pursuits such as fishing and stalking, found ready wearers. In 1857, an Edinburgh lady went about getting orders for the Harris weavers, and business increased so much that in 1888 she moved to London and opened a small depot for tweeds.

Thus by the time the nineteenth century had reached maturity tweed was becoming well known, and weavers and local merchants, usually shopkeepers, developed sales contacts on the mainland. At that time every web of tweed produced was unique: it could never be copied exactly. This of course added to its charm

Other tombs inside the church include that of Mary MacLeod, a bardess of the seventeenth century who was also governess to the young MacLeods at Dunvegan. She was probably the first to compose what may be called the 'court' song, in simple words and in the 'strophic' verse-form of rhythm and assonance enjoyed by all Gaels since her time. Her last elegy was composed to Sir Norman MacLeod of Berneray in 1705.

So far as personal characteristics are concerned, there is a marked difference between the Herrach (Harrisman) and the Leodhasach (Lewisman). Their Gaelic dialects are different, the Harris pronunciation being much softer, with an attractive singing lilt. And Harris Gaelic has fewer words of Norse origin. The main reason for this difference has been a topographical one: before a road was cut, the mountain barrier of north Harris divided the inhabitants of the two parts of the same island, who developed in their own distinctive ways.

The character of the land of Harris has also had much to do with the difference. Harris for the most part is infertile, with great expanses of rock outcrops. The east side of the island is torn in shreds by fiord-like sea-mouths; the west coast is slow-moving, with large expanses of sand and machar-land which look out over the Atlantic breakers rolling in from a sea that is oceanic in appearance and in fact. From early times the Harris folk have had to work hard to scarify their snippets of land to make it fertile. Regular increases in population forced them to cultivate land extending up to 500 feet above sea level in some places, in the form of hard-won lazy-beds. After the clearances early last century, when the more fertile lands on the west coast were taken over for the formation of sheep farms, the people concentrated on the eastern side of the island, and on some of the higher ground in the west.

On Lord Leverhulme's death in 1925 the ownership of large tracts of Harris passed to absentee landlords. After this, some of the lands which had been cleared a century earlier were purchased by the Government and broken up into crofts again, enabling some of the indigenous population to come back to make use of the more fertile lands of the west. There are some 550 crofts in Harris, with 29 regulated common grazings; the total

Account, there was one family there, that of the person employed by the owner to look after the livestock. The owner was a Ness tacksman who paid £4 sterling rent per annum. The island produce was corn, butter, cheese, a few sheep and sometimes a cow, and some wild fowl and feathers.

In 1844 Rona was evacuated, its last inhabitant being, in the seventh year of Queen Victoria's reign, the 'King of Rona', Donald MacLeod, who lived in almost prehistoric conditions. Rona was without inhabitants until 1884, when a last attempt at resettlement was made by two men from Ness. This was a self-imposed exile, after a difference of opinion with the minister of their parish; in penance, they hied themselves off to Rona. In 1885 a relief boat called and found both men dead, one from natural causes, the other from starvation and exhaustion after nursing his friend. By the fireside of their hut was a pot ready for the preparation of a meal they never ate.

Today, man's connection with the island is maintained by the small party of Lewis shepherds who each year make the journey to shear the sheep which still graze on the green slopes around the now-ruined village. Otherwise, only the occasional traveller now lands there. In June 1956, North Rona with its associated rock, Sulasgeir, was declared a National Nature Reserve on account of its importance as a breeding ground for colonies of oceanic birds—guillemots, puffins, kittiwakes, and fulmars—and for its seal colony.

Sulasgeir

Sulasgeir is twelve miles west of North Rona, a lonely rock in the Atlantic, bleak and grassless, and tunnelled by caves and gullies. The only life it has ever supported is seabirds—officially. Yet one of the old buildings is said to be a chapel and is called 'Tigh Beannaicht' (House of Blessing). According to Ness tradition, Sulasgeir was once used as a prison for sheep-stealers, and it is also said that Brenhilda, sister to St Ronan, was left on the island to perish. Yet another tradition claims that it was at this rock that Prince Charles Edward made his first contact with his Scots clansmen, when the ship that carried him to Scotland was spoken to by a Ness boat making for North Rona.

175 that the spade and foot-plough (*cas chrom*) were used for
114 double the area ploughed. From Monro and from the
311 precise Statistical Accounts of the eighteenth century, it is
clear that pony-drawn ploughs were usual in the smoother
[241] parts of Lewis. In North Harris are 'abundance of
[127] Deir'. We must not forget here that 'faire' and fertile
are comparative terms for the West. "Lewis is faire and
[136] weill inhabit at the coste, ane fertile and fruitful countrey,
for the maist part beire [barley], with 4 Paroche Kirkes."
[226] There is "ane castell callit Stornoway . . . with 3 salt
loches, very fine for take of herrings . . . [and] infinite fresh
water loches. In the Lewis there are 8 waters with take
of salmont. . . ." There were also "Whales . . ." In
"a cove 2 fadoms deep at the ebb sea, uses Whytuns
(whitings) to be slain with huiks", there were "very many
haddocks and Men with their wandes sitting [as today]
upon the Craiges of that cove, and Lades [boys] and Women
[136] also. . . . In this Ile there are many Sheip for it is very
guid for the same. For they lay furth ever one mures
and glens and never enters in a house and their wool is
bot anes in the zeire pluckit off them in some fauldes."
• [236] In Zetland wool is still plucked, not sheared.

The description of reclamation is specially worthy of note: "In this countrey all is peit mossland at the Sea cost, and the plaice where he wins his peitts this zeire [year] . . . there he sawes his corne the nixt zeire, after that he guidds it weill with Sea ware" [*i.e.*, improves or
[245] manures it with seaweed]. On "Ellan Colm Cill [an islet apparently on the east coast south of Stornoway at the mouth of Loch Erisort] Macloyd of the Lewis has ane faire Orchard, and he that is Gardener has that Ile [rent] free. . . ."

175 Around the coast of Lewis no absolute limit is set to
185
311

788 (in Gaelic) by a housewife in a Catholic isle, as our friend-
592 ship matured. It had been said nightly at her fire by her
354 father-in-law until his death (not long before), which had
539 come after that of his wife. "I smoo'r the fire tonight,
As Mary's Son smoo'red. Be it well with house and fire;
Be it well with all our household. Who are on this floor?
Peter and Paul. Who are on watch tonight? Light-white
Mary and her Son. Thus God's voice taught, And the
Angel spoke: The Angel at my house door, Until the clear
day come tomorrow. Amen." As this variant shows,
memory still lives in the Isles.[1]

788 In these runes, the key to the words "as Mary's Son
593 and as Mary did, in their day" is the example of filial duty,
796 of wifely and motherly care. In spite of lapses to 'Mario-
latry' during periods of decadence in the Roman Church,
[799] the virtual banishment of Christ's mother from Protestant-
ism has led to a loss deeper than Presbyterian Scotland has
yet realised. Her name was a daily reminder, both of a
woman's part in the spiritual life of the home, and of a son's
self-discipline and affection: in a word, of mutual love.

788 For wool, the sheep were blessed, as in the "Clipping
• [236] Blessing". There were blessings of the loom and of
[286] warping and weaving; and after neighbourly fulling or
'waulking' of the finished web, came its consecration.
[461] As the work was solitary and communal in turn, so the
prayer. Carmichael's own fine prose translations should be
[127] studied (*Carmina*, vol. i, Nos. 108-113; cf. vol. iv, pp.
[538] 88-99). Yet, those being available, we quote rhythmic

[113] [1] Cf. Rev. Allan Macdonald, *Comh-chruinneachadh*, p. 107; *Carmina* (Nos. 84-87, 324-326); and M. Kennedy-Fraser, *Songs of the Hebrides*, vol. ii, p. 31. Sacred lore is not to be picked up lightly by a stranger. It was only upon the second of my prolonged stays under her hospitable roof that this good woman would admit and impart her knowledge, treasured in the secret places of her heart.

788 versions to suggest the significant poetic form of the
538 original.

788 "The Clipping Blessing", being addressed to creatures,
• 236 is simple in thought and form, and its opening may be rendered:

O come back woolly, though now you're shorn,
By May, may each a lamb have borne,
May lovely Bride you endow,
And Mary fair sustain you now!

[825] It goes on to beg protection from wolf and bear, as well
[538] as fox, hoodie crow and eagle, and closes with the opening couplet.

236 From start to finish the work must be true. The wool
461 is from the sheep they reared—it is not got by 'thigging',
as a landlord takes 'gifts' from poor tenants; the yarn is
sound with no odds of thread from worn-out cloth; the
web is their very own, not the clergyman's due (*Carmina*,
786 110, 113, 109). Only so can the goodwife's web be beauti-
788 ful, and blest. "Thrums nor odds of thread, my hand
never kept nor shall keep. Every hue in the bow-of-the-
[539] shower has gone through my fingers beneath the cross."
[593] The weaver, with her household cares and her bairns about
her, to be clear in mind must be calm in heart as, thread by
[796] thread, she prepares her warp. To start, she chooses Saint Columba's Day.

[539]

Thursday of blessings
For warping and waulking,
Thrice fifty strands
To number . . .

Ward away the evil eye!
Or evil will, or aught awry,
Consecrate, O Lord on High,
My Loom . . .

175 though also by State loans. The efforts of the Island
278 fishermen in the sixty years from 1880 to 1939 can be
471 summed up in the values of their boats. From 1880 to
1900 values rose by one-half, but had fallen somewhat
458 before the war of 1914–18 (to £20,000). Immediately after, the purchase of steam drifters at Stornoway and the fitting their herring boats with motors by the fishermen had tripled the value (close on £70,000 in 1920). But markets fell almost at once, and losses continued. By 1938 the Island fishing fleet was valued (or overvalued) at a quarter that figure, and was worth less than the fleet of sixty years before.[1]

(D) THE CROFTERS ACTS, 1886–1919: TOWNSHIP, LANDLORD AND STATE

175 Centuries of cattle-keeping having left the grass moors
in good condition, the profits of sheep-farming rose after
• 236 1770 with the price of wool for manufacture. Protected
from foxes by modern guns, and handled in large flocks,
the newly introduced Cheviot and Blackface sheep and
[178] lambs could graze in their thousands. In many estates the
introduction of additional sheep, with the crofters' cattle,
was tried and worked; but in others the people were
175 ruthlessly evicted. Although offset by many acts of wise
236 economy and generous aid, evictions were too frequent
during the next half-century, and they engendered growing
427 bitterness.

Whereas in other Isles, and on the machar of Harris, the small joint tenantry and subtenantry were evicted in

[113] [1] Figures 1828–33 quoted from J. P. Day, *Public Administration*, 1918; 1888–1900 from Appendix K, Report, 1902; 1912–1938 from *Fishery Board for Scotland* Tables (Table E-IB, 1912–21, and Table 15 and A.I., 1938).

CH. IX ECONOMIC CHANGES: 1750-1919

175 favour of sheep farmers, in Lewis there had been very few
236 evictions. Early in the days of the sheep-farming boom,
427 one of the Seaforths had been offered ' double rents ', and refused them rather than turn the people away. Later on, when the wars were over, and when the Seaforth fortunes were failing, subtenants and their cattle had been replaced by sheep stock in three tacks around Broad Bay (at Coll and Gress and at Aignish at the base of Eye
[731] Peninsula). The failure of kelp-burning and the potato famine brought acute want in rocky parts of the Isle, and led to the desertion of their homes by certain communities.
175 In 1863, out of a total of forty crofters in a township of
16 Barvas parish, more than half emigrated by help of Sir James Matheson. Local resettlement was aided by Sir
[423] James, who provided horses and implements for Uig people who moved to Shawbost (6 miles north of Loch Roag). Abandoned places became farms ; and although agricultural prices fell and Sir James made little profit from the erection of buildings and the drainage, dyking and fencing on farms, land was improved, and better stock was bred, of which some was available to improve that of crofters,
175 too. Twenty years later, however, increasing numbers
427 increased the demand for crofts, and the people sought to reoccupy their forebears' land. In this, the Lewismen
[171] shared in a widespread movement, extending from the Scottish Isles to Wales and Ireland.

175 As a result of the real sufferings of the people in the
654 Highlands and Isles, and of the growing interest in the land shown in the country and in Parliament, where Irish
[648] members made themselves the crofters' allies, the Government in 1883 appointed a Royal Commission of Enquiry under a fair-minded judge, Lord Napier. As a remedy, the Commissioners recommended measures based upon

491 Brenish, at the end of the tarred road which also serves Islivig, is forty miles from
[496] Stornoway. On the thrice weekly bus the return fare to Stornoway was £1, and freight
cost half-a-crown for a hundredweight, but because of competition from privately owned
vans the bus service ceased in 1960. Mangersta is reached from the same road by about
a mile of untarred side-road of indifferent quality; formerly the only access to it was by
[366] a footpath over the sands to the south. General merchandise, fish and meat are supplied
[206] by weekly vans; there are no shops. There is a post-office at Islivig; banking facilities
[1955] are supplied by a mobile bank.

311 The majority of the crofts are long narrow strips, with those in Mangersta being some-
427 what more compact. The area ranges from two to nine acres, with an average of about four acres; in Brenish and Islivick only about half is usually arable. All the crofts - or croft-units - are fenced, the work having been completed in Brenish in 1956. There are twenty-nine crofts in the rental for Brenish, ten for Islivick and thirteen for Mangersta; but, owing to amalgamations of various kinds the number of operative units is considerably less - fourteen in Brenish, five in Islivick and ten in Mangersta. There are no cottars.

131 As soils are reasonably good and comparatively free from rocky outcrops, the arable
464 patches are large enough to be cultivated with a horse or tractor. There is a tractor in
[231] Brenish, and four horses, a horse in Mangersta and two in Islivick. All of these are hired for ploughing and carting peats. Very little work is done with the spade, unlike many of the other Uig townships.

233 While the general rhythm of township work through the year is similar to other areas, here the sheep are wintered up on the hills; some crofters winter lambs on their crofts. Brenish crofters are allowed to winter eight sheep, (or sixteen hogge, or four year-old heifers), on Mealasta Island - hogge are usually sent since their loss, by falling over the cliffs, is less serious than the loss of heifers. Eilean Molach is used by Mangersta crofters, who are allowed two sheep each in summer.

241 The only crops grown are potatoes and oats, with "black oats" (Avena strigosa) on the sandy soils in Mangersta. Since seed for "black oats" is unobtainable commercially, the crofters save their own. A grass mixture is sown by the majority of crofters for hay, to qualify for the subsidy.

233 The extensive hill and mountain pastures are not separately fenced; sheep from all three township graze over all. If the total sheep stock of the townships (about 3,300) is compared with the scoming figures it is found to exceed the soum by about 50%. On the other hand, fewer cattle and horses are kept than formerly so that taking the total stock for all animals (horses, cattle and sheep) and comparing with the actual stock now carried, the area carries only 87% of the stock which the soum allowed. In the two older townships the scoming was reckoned according to rent, being one cow, one two-year old and eight sheep for each £1. In Mangersta, however, the soum was one horse, three cows, one heifer, two stirks and twenty-five sheep for each croft.

Lambing percentage is about 80, and ewes form about 60% of the total sheep numbers
[236] (excluding lambs). In this district some weddars are kept for three years and then sold
[435] for meat, but the main income is from wool, about three pounds weight from each sheep, which sells at up to four shillings a pound.

231 Most crofters keep one or two cows, and the calves are normally sold in the autumn or spring sales. Brenish and Mangersta each have a bull, and in the three townships there are sixty-seven cattle and thirty calves. Shielings, formerly used for about seven weeks in

An attempt has been made in
Fig 19 and 20 to relate the size of the stock carried on
23 the individual croft to the size of holding and to the availability and age of the labour force.
311 In both diagrams there is a significant division between the subsistence holding (0 - 7 units)
464 and the commercial holding (11+ units), but there is no definite relationship between stock
471 and size of holding or labour availability. The inclusion of the points of equilibrium for
certain lines in Figure 20 reveals a somewhat unexpected state of affairs: in the case of
233 crofters with regular work and full time crofters, those over the age of forty-five carry a
162 larger stock from those under forty-five. It is frequently argued that the solution to the economic problem of crofting lies in the amalgamation of holdings in order to create a more viable economic unit, but the indication from these diagrams is that an increase in the size of holding will not, of itself, lead to an increase in stock. It is the absence of
[443] accessible markets that deter the crofter from increasing his agricultural production.

511 In their present state the crofts in the Valtos area are unable to provide a livelihood
469 for the crofter and his family. Of the crofters under sixty-five almost 90% supplement the croft income by other employment. Of these casual labour (at present mainly at the Gisla hydro-electric scheme) accounts for 57% regular work - particularly weaving - 43%. The combination of crofting and weaving provides probably the best return for the labour: one crofter with a croft of 3.3 acres, carrying two cows, two followers and ninety sheep (sixty ewes) made the following estimates for 1958:

231 FROM THE CROFT:

Sale of two year-old calves	£80
434 236 286 Cow and calf subsidies	£40
Sale of wool at 4s. 3d. per lb.	£75
	£ 195 (1)

FROM WEAVING -

at two tweeds per week (32 hrs. p. w.)	£550
GROSS INCOME	£745

434 Weaving about 30 hours a week apparently leaves him sufficient time to run the croft
[236] efficiently: at present a crofter supplementing his income by a labourer's wage at Gisla
[286] hydro electric scheme would have to put in nearly sixty hours per week to achieve the
[164] same financial reward.

433 The economy of the Valtos peninsula has been changing, and contracting, for several
[78] years. The number of unoccupied crofts is increasing; commercial fishing ended at the
[236] time of the first World War; the shielings have been abandoned as summer cattle pastures.
[286] The Valtos shielings near Loch Scaradale were abandoned during the 1939 - 45 war, due
[231] mainly to the lack of manpower in the township, though some was used intermittently until 1953. The shielings of Kneep and Reef were abandoned in the late 1930's, at which time Kneep had some fifty milk cows as compared with fourteen in 1959.

1 Against this figure, must be set the costs of production (i. e. fertilisers, new seed, winter fodder supplements, sheep dips etc.)

221 231 233 236

FIGURE 30

Calendar of stock

movements in the Bernera district

22/ Since so much of the year is spent either upon or near the crofts it is but to be
23/ expected that greatest heyfing will take place in the summer when they are far from supervision upon the hills; this contrasts with the mainland Highlands where heaviest losses, apart from those due to sudden snow falls, generally come about lambing time, when this takes place upon the hill, or soon after, in cases when the ewes and lambs are put to the hill too soon. On Bernera Shore on the other hand losses are heaviest on the hill in winter. Losses are extremely uneven in their incidence in time and from croft to croft. The cause of loss varies: there are no serious endemic diseases now, and there are few coastal cliffs - a frequent cause of loss in other places. There are however some boggy areas in the interior and some rugged: whether or not there are losses due to vermin particularly eagles, is a debatable point. Probably the fundamental cause of loss is lack of shepherding and adequate day-to-day oversight upon the hill.

233 There are certain special pastures that show interesting features. The Flannan Islands have excellent pasture, especially for the poorer male shearlings which need bringing on. There is all-the-year-round grazing for fifty sheep, which is shared by two crofters in Crulivig and one in Earshader. Unfortunately, the difficulty of getting a boat to go across has meant that for the last two years no visits have been made, and, after one or two years unattended, the animals become quite wild. Since 1949, when the Croir tenants were first permitted to cut peat upon the Bernera shielings, they have ceased to do so on Vacasay Island, where they now each send two sheep for summer grazing. They also send one sheep each to Euglam Island from 15th May to 16th August. One croft in Tobson includes certain small islands:

Bearsay Island (16.4 acres; soumed for 12 sheep per annum)

Eilean Fir Crothair (4.6 acres; soumed for 5 sheep per annum)

Seildeim (1.0 acres; soumed for 3 wedders per summer)

Similarly, Valasay (part of Tobson), has Eilean Liongain Valasay which provides summer pasture for two young cattle beasts or five sheep (one per croft). One crofter in Crulivig has a small island, Eilean Liongain Island, for lambing and at least one crofter in Crulivig also grazing on Ben Sgurain, but there has been no success in the attempts to heft stock there. It is distant and unfenced; losses can be heavy.

23/ Lewis is a very restricted market for livestock: the general practice in the Bernera area is to sell cast ewes at five or six or even more years to the butchers in Stornoway. Lambs may be sold on occasion, but generally they are kept either for replacement or for sale as three-year wedders.* The losses which occur, plus a certain amount of slaughter for domestic use, prevent long-term accumulation, though periodic fluctuations may be severe. Occasionally when there is a surplus of summer grazing, the Bernera Shore townships may buy in lambs from the western coast of Lewis, carefully eschewing those raised on the machair lands, which are said to be too "soft" for the hills. These are reckoned a gamble, they may or may not "take". The practice may be compared with that of the former Linshader Farm where, to take up the summer surplus of feed, young cattle were bought from the crofters.

236 The wool from the Lewis Blackface sheep generally varies from three to four lbs.
[236] per fleece. There is no longer any hand spinning; most wool is either sold outright or
[232] sent to the mills for spinning and dyeing. This practice is of long-standing. Even before the Great War, when the rent formed by far the most important item in the monetary affairs of the croft, the wool was either sold outright or, more commonly, sent to the mills for spinning and then taken to a weaver; the tweed was then sold either locally or to a merchant in Stornoway, the proceeds being used for the rent and other items.

23/ Cattle, as has been pointed out, have declined greatly in relative importance since
170 1883: they are fewer in number - though far better in quality - and consequently subject

[232] *Three-year wedders in good condition fetch about £6 for slaughter. Carcase weight is about 44/45 lbs., sometimes as little as 38 and sometimes as much as 55 lbs.

231 Cattle are kept on 162 of the 219 units; in all there are 180 cows of three years and over, 47 young cattle, and 110 calves. The usual practice is to suckle the calves, and sell them as soon as they qualify for the calf subsidy; lack of winter-keep is one of the reasons for this practice.
[234] The breeds of cattle are mainly Shorthorn and Aberdeen Angus with a few Highland cattle. The other function of the cow is to provide milk for the household; households without a cow rely
[232] mainly on tinned milk. Cattle are sold at the twice-yearly market held at Garyvard, but prices fluctuate greatly. The townships of Park certainly do not carry a full souming of cattle.

Sheep are more important than cattle in the crofting economy in Park. The breed is the
231/ Lewis Blackface, a small, lighter type of the Scottish Blackface breed. The sheep are pastured
233 on the common grazings in summer, and are grazed on the croft land in winter. The standard of
[232] sheep husbandry is also low as few crofters dispose of cast ewes or have a defined breeding policy as all stocks mingle freely on the commons. The lambing percentage for 1958 was about 60 per cent and the number surviving in August compared to the total ewe stock was 52 per cent,
[235] but it was generally agreed that 1958 was a poor year. A further indication of the quality of the sheep is that in the fishing townships, a ewe fetches from 35 to 50 shillings, and a lamb about 20 shillings locally. The low lambing percentage and poor prices can be partly ascribed to the lack of good grazing and to overgrazing, but disease and losses in a treacherous common pasture raise the mortality rate. In general the sheep are left to fend for themselves with a minimum of shepherding although the more progressive crofters hand-feed the ewes and hogge in bad weather.

The majority of the crofters in Habost and Kershader, and a minority in Garyvard, rent additional grazing in Park Deer Forest, paying a fixed sum for each sheep. Sheep from these townships fetch better prices; in the other townships a few wedders and fewer cast ewes are sold to the
[236] Stornoway butchers. In many flocks, wool provides the only income from sheep.

It is evident from Table II that the sheep souming is greatly exceeded. In the calculations, ewes are taken as one unit, and 'other sheep', wedders and gimmers, have been calculated at half rate. On this basis, the overall sheep souming is exceeded by 70 per cent and in only one township is the stock comparable to the souming. Overstocking has been encouraged in crofting districts by the ewe subsidy which was in operation till 1956 and it is notable that the rise in numbers of sheep recorded in the Outer Isles coincided with the introduction of the Hill Sheep subsidy in 1930.[1] Overstocking is without doubt the chief reason for the high mortality rate in sheep. Calculation of the overall relation of the actual cattle and sheep stock to the souming shows that the common grazings of Park are overstocked by 14 per cent. It is, however, impossible to calculate an exact figure, as the number of sheep grazed in Park Deer Forest was not enumerated. It is also evident from the individual croft surveys that the cottars, squatters and feuars, who have no rights of grazing, have stock equivalent to 137 cow-units or 12 per cent of the total stocking. Thus the crofts of Park are maintaining an average stock fairly close to the souming, but the cattle-sheep ratio of 1:28 is too low for proper management of the pastures.

In general, a low standard of husbandry obtains in Park but it is clear that the agricultural townships are much more efficiently operated than the fishing townships. Overstocking occurs in seven of the twelve townships and sheep stocks are, with one exception, higher than the sheep souming

1 In Scotland as a whole, the number of sheep recorded declined from 8,007,134 in 1938 to 7,336,000 in 1955.

[Kershader]

235 (b) From New Year to mid-April most sheep are kept on the common grazing. Practices,
911 however, are irregular; some flocks are usually hand fed, others only rarely. In the former
231 case they heft near the upper limit of their home croft and remain fairly close at hand.
231 Most crofters hand-feed their lambs, probably housing them at night, allowing them hay in the morning and turning them on to the common grazing in the evening. All this naturally depends on weather conditions.

(c) From mid-April to May, lambing takes place on home parks.

Most crofters let their ewes-with-lamb out at one date.

(d) At the end of June, gimmers and wedders are clipped.

(e) In mid-July the ewes are clipped.

(f) The lambs are weaned in the first and second weeks of August.

(g) The dipping takes place in October and the rams are brought on the crofts.

[232] There is no general sale time, sheep being sold or slaughtered at all seasons. There is no club stock, but all but one of the Kershader crofters, along with crofters from neighbouring townships, take full advantage of the arrangement, first established in 1941, to graze sheep at 2/- per sheep and 1/- per lamb in Park Deer Forest. Hence irregularities of rhythm are introduced or exaggerated.

231 Sheep are not particularly profitable: in general, wedder fleeces give 3½ to 4 lb, ewe fleeces
[236] about 3 lb, and the wool is sold to the Stornoway mills and to the Wool Marketing Board. Average
[235] sheep carcass weight is reckoned to be 41 lb. and the price rarely rises above £3 and almost never above £4. Braxy and fluke are kept under by medicaments but remain potential dangers; 'Black leg' is still a serious problem. Many sheep are drowned in the bogs in Spring and late snows (1955, 1958) are disastrous for lambing.

241 Under-employment is a serious problem in Kershader. There are nine males classified as
161 full-time crofters, but probably only four of these (two on one croft) are in fact in this category,
162 and of the total of thirty males with their homes in Kershader, only fifteen of the insured
167 population are permanently resident. There are twenty-eight females with their homes in this
166 township, but on only six crofts do any of twenty permanently resident females help with croft
444 work. Local ancillary employment consists of weaving, fishing (for domestic consumption
[223] only) and work on the roads. Boats, one with outboard motor, are owned by three crofts. The
[601] only resident professional worker is a nurse. Ancillary employment must be, and is, sought away from the township. As a result, of the 73 persons recorded as having migrated since 1939 or as being resident, periodically away and permanently away in 1958, 19 have left the area for good, 4 are permanently away, 8 periodically away, and only 43 are resident. Only one person has entered the township since 1939. The age structure of the population, too, is far from the
[195] optimum. The school in Kershader, which had 20 pupils in 1873, reached a peak of 110 in 1907
[192] and declined to 28 pupils in 1953, now has but 17, although it serves Caversta, Garyvard,
[271] Kershader and Habost. Maximum population was attained in 1881, but the total remained fairly constant till 1911, after which decline was marked. Since 1950 this decline has markedly increased.

182 It will thus be seen that the most serious problem facing Kershader is that of stabilising the
241 population and giving it a stronger economic basis. Apart from the potential development of tourism, fishing, weaving and other home industries, the only possible occupation is in
[215] agriculture with perhaps a little forestry. Forestry, though important as shelter provision, cannot be a practical proposition in large blocks or on a large scale, as it would dislocate the

[Caversta]

241 Each croft is fenced but has a gate giving access to the common grazing, in which each crofter
[5] holds an equal share. The township has no specially enclosed area for fanking or other purposes
911 and no fixed date exists on which the crofters open their gates for winter grazing. Breeding ewes
[192] are normally brought in for tupping in mid-October and November when crops have been gathered, and lambing takes place in late March or April. After dipping and inoculation with vaccines for black leg, braxy and louping ill, the sheep are put out on the common grazing in the second or third week of May.

The 642 acres of common pasture support a sheep stock equal to the sheep soum, but the overall
231 stocking is only 88 per cent of the total souming. Two crofts only exceed their individual soums,
235 while the others are well below the number required for greatest efficiency. The grazing is, however, poor for summer pasture, owing to the lack of grass, but the heather is valuable for wintering the
[236] hogge. Lewis Blackface sheep are the predominant breed and the wool, clipped in July, is sold to the Stornoway mills and the animals themselves are sent to the slaughter house. The 1958 loss at lambing was exceptionally high owing to a cold, dry spring preventing the growth of grass for the ewes. More than forty lambs and thirty ewes were lost by the township last winter, a number four or five times greater than the average loss.

Six cows, two heifers and four calves are kept in the township and tethered most of the year on
[236] the crofts. Calves are born throughout the summer months, but whereas early-born calves may be
[232] sold in the Autumn at six months old, those born later must be wintered to eight months until the Spring sales. The cows are served by the Department of Agriculture Highland bull at Habost, but although good prices are obtained for beef cattle, it is felt that for the family milk supply, a dairy bull would produce a better strain.

In addition to keeping stock, oats are cultivated on five holdings and potatoes on six. In
241 most cases the land under each crop is less than half an acre and nowhere does it exceed two acres.
[236] The land has been built up into lazybeds about six to ten feet wide, separated by open drainage
[236] channels and worked by the spade. There are only two holdings where a tractor (hired from Habost)
[197] is used and the acreage cultivated only amounts to three-quarters of an acre. Conditions are not altogether suitable for mechanisation at present, for the terrain is very uneven and broken up by marsh and steep faces of bare rock.

[197] Neither Torista nor Caversta is on a main road. The former is served by a track joining the road near Cromore, while the latter has a secondary road running as far as the township dyke, and an inferior footpath joining the main road at Garyvard. The lack of a good road within the dyke
[236] acts as a deterrent to the use of modern equipment and fertilisers. Byre manure is used on all
[236] the crofts and seaweed is brought from the shore and spread on the lazybeds. Artificial manures,
[227] used on only three crofts, must be carried over rough ground from the dyke. This lack of incentive to improve is perhaps even more marked by the fact that on one holding alone is a rotation practised - potatoes, oats undersown with clover, then hay for three or four years. Apart from this one instance, potatoes and oats are sown, perhaps alternately, on the same strips for many years. Natural grass yields the bulk of the hay and is often cut from lazybeds that were formerly cultivated. On one croft there is upwards of quarter of an acre where the old ridges can be seen to have a crescentic shape and are thought to date back more than one hundred years. A short distance beyond the township dyke is a similar stretch of land, now colonised by heather.

241 Peat still forms the principal fuel and, apart from one half acre patch within the dyke, is cut
[236] on the common grazing, as near the road as possible in May and June, and later brought home by
[236] creel, bicycle or tractor. Three of the six operative units still have gardens and all keep up to
[236] twenty chickens; rowing boats for line fishing, solely to supplement the larders, are also maintained
[236]
[236]
[236]
[236]

In 1841 population records show that there were twenty-two persons at Caversta and seven at
[236] Torista. After 1881, when maximum figures of fifty-nine and nineteen were noted, there was a
161 secondary peak in 1911 in Caversta, followed by a steady drop to twenty in 1951 and eighteen in 19
162

[Cromore]

The crofters sowed
clover with their oats in 1957; the quality of most of the natural grass could be improved considerably by extending this practice. Several of the crofters have taken advantage of the facilities for obtaining lime and fertilisers, but seaweed and byre manure are widely used. Only seven crofts have vegetable plots this year but that of No. 23, (partially enclosed by a dry-stone wall) has produced crops of lettuce, cabbage, turnips and carrots.

The souming for Cromore is one cow, one heifer and eight sheep per £1 rental, but is not enforced. The crofters keep the stock which they can manage to maintain throught the winter and no one appeared to be dissatisfied with this arrangement. In fact the souming is exceeded by only seven crofters and the total stock for the township is only 75 per cent of the soum. Lambing takes place in April and May and often a high proportion of ewes and lambs is lost. The sheep are clipped in July and each crofter usually clips his own sheep. He either sells the fleece or has it spun in Stornoway before weaving it himself. The lambs are taken from the ewes during the second week of August and then dipped; November is the tupping period and almost every crofter had his own ram. Most crofts have a cow and a calf and the crofters like the calves to be born in March so that they are six months old in October for the Garryvard sales. The cows are served by an Aberdeen-Angus bull from Croisg Farm. The township gates are opened in October and the cattle remain within the bounds until May. An interesting regulation enforced by the Grazings Committee is that each family can have only one dog, and that it cannot be taken on to the Common grazing without special permission, or on fank days.

Shielings, situated on the common grazing between Calbost and Cromore, were used until the 1890's. Active land use has gradually declined; in the 1920's, much of the outrun was under cultivation and from an an air photograph, it is evident that hay was being taken on the strips above Cromore in 1946. The present trend is a continuing decrease in the amount of arable land but this year ten crofters formed a group to enclose and improve a ten-acre plot on the common grazing; it is unfortunate that all crofters are not willing to take part. Peats are now being cut near the road between Caversta and Gravir, about three miles south- south-east of Cromore and one mile north of Gravir.

Cromore was once a prosperous fishing village but now it has no fishing boats. Two Cromore fishermen work on other boats (one from Marivig and one from Stornoway) and there are a few men who would welcome the opportunity to start fishing again. There seem little prospect of this, however. The landing-stage, completed in 1957, is regarded by many as a 'white elephant' and, in fact, at low tide it is useless. So much for the hopes that it might have been used by cargo vessels bringing goods to Park.

In Cromore there are fourteen looms for the weaving of Harris Tweed. Tweeds are obtained by road from two mills in Stornoway and one in Airidhvraach. At present the average production is only one tweed per loom per week but the weavers could quite easily double their production. During the past two years this industry has been comparatively prosperous. Knitting is a winter pastime but only for pleasure, although one household possesses a knitting machine.

In common with the rest of Park, Cromore has a high proportion of old people. Many from the middle age groups have sought employment on the mainland, and the teenagers, many of whom have been at school in Stornoway, seek jobs there or on the mainland, returning for holidays and assisting with the croft work. Some younger folk are resident to care of aged parents.

Cromore is only eight miles by sea from Stornoway yet all communications with the town are by road - a distance of thirty-two miles. There is a daily bus service and the sub-postmaster has a van which is occasionally hired. Some people recalled that the only route to Stornoway was once by boat to Crossbost and thence by bus. One resident owns a lorry and this is used for most of the haulage in Cromore, particularly for bringing home peats during the summer. As a result of recent additions to the roads, only three crofts remain inaccessible to vehicular traffic. There are no shops in Cromore but grocery vans call on Monday, Tuesday, Wednesday, Thursday and Saturday;

amount of time which is allotted to each activity and in the pressure on the crofters to complete each chore within a relatively definite period. There are also differences in the number of non-crofting activities in which the individual can or must engage. Let us follow several crofters through the year to see what these differences are.

The Full-time Crofter. One might say the year for the full-time crofter begins during the first week of January when he goes out to the hill to bring in his rams. This is the first break in the monotony of his winter schedule, but it is only a momentary break. Not until March does his season of prolonged labor begin with the first "dipping" of the sheep to rid the animals of tick and parasites. He and his wife, their children, if they are old enough, and their neighbors or hired hands, crofters from nearby townships, join forces. Several of the men go off to the hill to gather the sheep and herd them down to the "fank," a stone or sheet iron inclosure consisting of either two or three pens, a trough for the "dip," and a shearing platform. While waiting for the sheep, the remaining men and women prepare the "fank" for the day's work. One by one the sheep move through the pens until all have been picked up bodily and submerged in the medicinal bath. The women not only help their fathers and husbands at the "fank" but also prepare a noon meal for the group.

Following the dipping, the crofter turns his attention to the soil. By late March or early April he has ploughed,

If May is considered a busy month, June duties are even more pressing. Although the winter gales are over, the rainfall has begun to increase. A succession and variety of demands are made on the crofter's time. Once again the sheep must be brought down to the "fank." This time the purpose is to mark the lambs. The males, unless one or two healthy specimens are selected for future use as rams, are castrated and smeared with a dye to indicate their ownership. The females are smeared and have their ears cut to signify both ownership and age. Like the dipping, this operation requires the cooperation of the crofter and his family, the neighbors, and hired hands. Next the sheep without lambs are dipped once again and given a dose of medicine for liver fluke and a variety of diseases. At the same time, the early hay and, perhaps, the early potatoes are ready for harvesting. The end of June brings the Highland Wool Fair in Inverness. If he has Cheviot sheep, as most crofters do, the man must go to arrange for their wintering on the milder and drier east coast. Although Cheviots produce a finer wool than the more common Blackface sheep, they do not stand up to the incessant wind and rain of a Skye winter. If his wife can leave the children behind, she will accompany her husband. The old function of the Fair, the sale of wool, has disappeared under government price control legislation.

It is not unusual to have the early harvest delayed until July, but even then the mowing may have to wait because sheep must come first. On one of the dry days during the first

or second week, the ewe sheep are sheared. Shearing is another cooperative task. The men and women work together with only one significant division in their labor. Women never shear. Their task is to run the sheep through the pens and fold the fleece after the two men shear the animal. Another chore is added to the crofter's schedule at this time. He must begin to watch his sheep for maggot.

The haying season runs through July and August, depending on the weather. In August the sheep have to be dipped again this dipping prescribed by law, and the wedder lambs (castrated males) are sent to market. In September, if the weather is favorable and the season has been good, the harvest of oats begins. The man works with a scythe. Women never cut. His wife helps by binding the corn in sheaths by hand and making stoops in the field. Later she helps her husband build the stacks for winter storage. As in any summer month, the stock requires attention. Cast ewe sheep (sheep over six years old) and old rams are sent to the Ministry of Food grading station at Kyle, on the mainland, to be graded for meat or to Dingwall to be sold at auction. Cattle sales are also held on the island in September and again in November, but the full-time crofter prefers the Dingwall auction. The rainy season is now, as noted, reaching its height. The pace becomes slower. October, November, and, perhaps, even December are spent trying to dig potatoes and turnips. Too often the oat harvest has yet to be completed and the sheep must receive their second statutory dipping. Sometime before the end of November the

hompson H-4,5 (no date) 1973 ES10 Highland Scots ES10
Lewis and Harris

north-west of Gallan Head. There are seven main islands, all small, high and cliffbound, and a number of rock stacks and islets. All are uninhabited. Eilean Mhor, the largest, of 39 acres, has an automatic light. Dean Monro's description of the islands as 'nouder manurit, nor inhabit, but full of grein high hills and scheipe' still holds, for sheep are taken annually from Lewis to the grazing on the Flannans. Their name is said to be derived from the ninth-century St Flann, whose saintly influence was recognised during the centuries when men from Lewis visited the islands for their harvest of wool, wild fowl and feathers.

The Flannans were the scene of a great sea-mystery: the complete and utter disappearance of three men from the lighthouse at the turn of this century. In December 1900, the lighthouse, with its 140,000-candlepower beam 283 ft above sea level, was a year old. It had taken four years to build instead of the estimated two. All the materials had to be swung up piecemeal from the boats and hauled up the almost sheer 70 ft cliffs to the top. That month a passing ship, the *Archer*, noticed that the Flannans light was out; a message was sent to the Flannans shore station at Breasclete, Lewis, and the *Hesperus*, preparing to pay a Christmas visit to the lighthouse, got under weigh.

Its crew landed and searched the island, but found no trace of the missing keepers. In the lighthouse was an uncanny silence. The fire was dead. The clock had stopped ticking. The beds had been made up in the clean, clinical way of all sailors. And in the galley, the pots, pans and dishes sparkled their welcome to the searchers. In the lamp-room the lamp was cold. The wicks had been trimmed and the lenses polished. The logbook showed a last entry on 0900 hours, Saturday 15 December. In the subsequent investigation some theories were offered in explanation of the disappearance, but none quite fitted. The mystery remains, a haunting, unexorcised cloud hovering over the island.

The Shiant Isles

Turning to the east coast of Lewis, in the parish of Lochs are the Shiant Isles, about 4 miles off-shore, across the Sound of Shiant (Gaelic: charmed, enchanted). There are three islands in the group: Eilean an Tigh (House Island), Garbh Eilean (Rough

THE OTHER ISLANDS

The flesh of puffins, gannets and fulmars was the staple diet of the St Kildans; the oil and feathers were the vital exports that paid the island rent to MacLeod of Harris, the owner of the group. These exports also helped to pay for the purchase of such foodstuffs as salt, sugar and tea, and other items which the island could not itself supply. The St Kildans owned some hundreds of sheep, the wool being spun and woven into tweed, and a few cattle were also kept. But the seabirds were the foundation of the island economy.

The factor which led ultimately to the desertion of the island group was isolation. The community there was throughout its history undoubtedly the most isolated in the British Isles, though until the present century this mattered little to the St Kildans. All that was deemed necessary for the continuation of the community was that, once a year, MacLeod of Harris should send his factor over from Skye to collect the island goods that were to be sold, and to bring with him those provisions which would see them through another twelvemonth. However, as the demand for the island's products declined, communications became more important: to support the family a man had to leave to find work on the Scottish mainland. Large-scale emigration began in 1852 when thirty-six islanders (with State aid) left for Australia. Island life was punctuated by loss of life; boating disasters and cliff-falls in particular deprived the community of the vital male elements needed for survival. Tetanus infantus, known on St Kilda as the 'eight-days' sickness', strangled two of every three babies born; this disease ravaged the island for almost a century and again struck harder at the male sex. About 1810 the population was about 200, a definite overcrowding. By 1861 it had fallen to 78; in 1911 it was 80, and in 1921, 73. A decade later it was nil.

Isolation tended to make the St Kildans a human menagerie. With the improvement in boat services, St Kilda became a 'must' on tourist itineraries. The tourist trade took on an economic importance for the population after July 1877, when the *Dunera Castle* steamed north and west for a voyage to the 'romantic Western Isles and lone St Kilda'. The steamers continued to call throughout the three summer months annually for sixty years, their passengers eager to buy souvenirs: tweed, quern stones, spinning wheels, stuffed birds and eggs; indeed, anything to remind them,

each township as a sign of contempt.[10] This suggests that the practice of helping one's neighbors with the harvest was relatively recent. Again in the matter of cutting peats, frequently described as cooperative, and a communal undertaking as late as 20 years ago, there is disagreement. All in the township used to work together, cutting for each crofter in turn and enjoying a festive picnic. "Sure they would," others told me,* but first they would cut for the minister and then for the shopkeeper.* The shopkeeper was more important to them in those days because they would all be in perennial debt to him, and he might extend a little more credit if they were in his good graces. They would then cut for each other. By the time they got around to the old widow with no one to cut for her, they were all too busy. The sheep had to be dipped or the fields needed attention. I have heard conflicting versions of these stories from neighbors. Are we to conclude that cooperation varied from door to door and township to township?

The growth in importance of sheep as a major source of income, associated with the decline of the old subsistence economy, led to new patterns of cooperation. To be economic sheep must be raised in numbers. As we have seen, physical cooperation is imperative, and many crofters cooperate financially, pooling their capital and dividing the profits. This is true of the nine townships of Kilmuir. Moreover, even in townships where the crofters have rejected the club stock plan the individual flocks are generally handled as club stock.

10cr. William MacKenzie, Sgrs: Iochdar-Trotternish, p.59.

In Claigan, for example, the crofters felt they would do better with private flocks than with a club stock. Although each man now has his own sheep on the township grazing, they are cared for like any club stock. The four crofters are needed for success at the dippings, marking, and shearing, and they are always at the fank on these occasions. In larger townships, those with ten or more holdings, the need for all of the crofters to help out at the fank is less pressing while the felt need for auxiliary employment is stronger. In consequence, the cooperative work habits run less smoothly. In an attempt at adjustment, many townships have resorted to paying the share holders for their labor from the profits. To the best of my knowledge, only one township has witnessed the total suppression of the cooperative spirit; all the crofters are too busy with full-time employment to bother with the steadily declining sheep stock.

Nevertheless, it has become commonplace for the crofters to complain of at least one individual in the township who does not pull his full share, someone who is "trying to sabotage the whole thing."

Independence is a personality trait, but it is best described as a steadfast determination not to conform for the mere sake of conformity when an innovation handed down from the outside commercial world is at stake. The old ways are the best ways, even if only the old men think so. It is the old men who uphold the traditional practices. As long as they do, and as long as unanimous consent is required for any change,

237 ANIMAL BY-PRODUCTS...uses of animal by-products (e.g., bone, teeth, horn, hoofs, claws, eggshells, hides, fur, hair, bristles, feathers, sinew, brains, urine, dung, urine, manure); processing of such materials not elsewhere described, etc. See also:

For example,
a Widow Catherine lost "one red
[175] mare and foal (L10), one dun cow (L3/10),
[42] [135] and one calf
[551] Seafer (L1/10)." One family is said to have paid rent by being fiddlers for "the castle" (the home of Sir James Matheson), thus earning the patronymic, "Fiddler." Their income stopped abruptly when the fiddler at the time, a great-grandfather of descendants now living, converted to the Free Church and smashed his instrument.

In 1899 and in 1905 it was noted in the rent ledger that two crofters wanted "first chance of a vacant croft in the township." In the first quarter of the century, [429] [764] a conflict ensued between Shawbost and a neighboring township over the extension of a cemetery; land was too precious to take out of cultivation and give to the dead of another village.

A 65-year-old man recalls, "Men got their living from the land and sea. They kept more cattle when I was young. They used the dung of the cattle to fertilize the soil. The entire croft was used. My father's croft was only 23 acres, but he worked it well and harvested eight stacks of barley to see us through the year." There were a number of kilns to dry grain, and mills along the streams to grind the barley. The "old Norse mill" which was recently rebuilt by the school children as a school project was in operation from 1920-1934. "Then the tweeds got

53

283 "You got away from village life when you went to
[829] the shealing. The youngsters ran wild. Everyone talked more freely somehow. It didn't feel like a Sunday out
233 there—the minister couldn't see that far. Only the
[833] young men and women in their late teens or 20's were out at the weekends. They would send the younger ones home. They came out in their good clothes, from Saturday night to Monday morning. Groups of young people walked out and back together, the girls in one group and the boys in another, joking and teasing. They sang the old songs and learned new ones from each other. Some were good at making up songs. You wouldn't believe how many people could sleep together in a single shealing. It was a [829] heaven on earth. Everybody was one family. The hills were filled with the sound of voices."

233 Not every family in the village went to the shellings. Some families had enough land within the township to graze their cattle. But they usually went out at the weekends, for the fun and company.

237 One of the most important products of the cow was
24 not milk but dung, which was used to keep the poor land
233 productive. Because people did not have the enriched
234 animal feeds available today, a cow might not have a calf, and thus did not give milk, for four or five years.

127

233 costly, that the Common Market will soon drive up milk
234 prices, and that income from the weaving has become too
434 uncertain.
412 Many tools and techniques associated with crofting
178 have disappeared: the flail for threshing oats (two pieces of wood joined with leather); the sheepskin stretched over wood with holes burned into it, to separate chaff and grain; rope made of plaited heather and straw. Each spring the byre was cleaned of its accumulated dung
241 and urine, and this was turned into the ground along
[252] with seaweed. Such tools and techniques remain among
[252] the older villagers as a "memory culture" which may be
[175] mobilized under changed conditions, as when alternatives
[387] to crofting are no longer available or are too costly. However, as longer crofting is neglected, the less it will provide a alternative strategy. "The artificial fertilizers are ruining the land; that's why the
241 turnips are full of maggots and the potatoes turn to
[924] water." As the rushes grow and clog the drains and
[233] streams—rushes that used to be eaten by the horses and cattle and which are now left untouched by the sheep—the land becomes unfit even for grazing cattle. "I'd rather work the land than the blinkin' loom, but we tried the potatoes, turnips and cabbage last year, and lost them all to the maggots. You lose heart after that."

AGRICULTURE AND FISHING

228 and its neighbourhood becoming the centre of the growing in-
*175 dustry. In 1793, the Lewis Parish contributors to the *Old Statistical Account of Scotland* indicated that upwards of 103 boats were
[142] fishing off the island. In Uig no less than 270 netmakers were
[286] recorded, showing that the fishing industry was prosecuted with some measure of enthusiasm. 'All the people dwell in little farm-
[142] villages and they fish in the summer season. The women do not fish; but almost at all times when there is occasion to go to sea, they never decline that service, and row powerfully.' In the parish
228 of Barvas in the eighteenth century some 9,000 Scotch pints of
*[237] oil were taken each year from dog-fish livers and sold to Stornoway merchants at from 6d to 8d per pint; it is related that the tenants of Ness were able for a long time to pay their rents with
[433] the oil proceeds. Cod and ling were the principal fish caught by the men of Locha, an annual average of 24 tons being cured and sold in Stornoway. Generally, other fish caught were consumed locally.

Loch Roag on the west of Lewis proved to be about the best fishing ground; in 1794 about '90 sail' from all parts of the United Kingdom were at the herring fishing there. At one time Loch
228 Roag-cured herring was exported exclusively to Sweden. The
*175 minister of Stornoway, contributing to the *Old Statistical*
[42] *Account*, gives figures showing the quantities of fish shipped from the port from 1791 to 1796. During these six years some 14,000 barrels of herring were exported to the Continent, and 20,000 sent for consumption in Britain; some 350 tons of cod and ling were destined for Continental markets. Herring, cod, and ling were thus pursued during the following years with growing vigour, though the inshore white fish took favour. The herring fishing did not make great strides, mainly because to the middle of the nineteenth century catches were confined to the inland sea lochs; the people for the most part were not familiar with deep-sea fishing, and their boats and nets were not suitable for it.

Indeed, when Sir James Matheson bought Lewis in 1844, he
228 gave scant attention to the potential in the fishings round his
*175 island. Though he expended considerable amounts in securing a
[304] regular steamer communication between the mainland and the island, and spent over £2,000 in building a quay at Stornoway

TRADE AND INDUSTRY

283 in the eyes of the more sophisticated purchasers, as did the
*175 domestic and primitive conditions of its manufacture. All processes were carried out by hand. The wool was washed and dyed
283 out of doors beside any convenient stream where a big black pot
*175 could be set up on stones and heated by firing peats. Carding, a tedious and unpleasant task, spinning and weaving were done in the 'black houses' of the crofters, which often lacked chimneys or proper windows; the tweed acquired more by accident than design a definite 'peat reek', which was duly considered to be another of its attractions, combining with the mainland townsdwellers' pleasant thoughts of Hebridean thatched cottages, peat fires and natural dyes from island moors and shores, to give the cloth something of a romantic aura.

Development

The increased demand brought problems however. Carding by hand was a slow business and quite unable to keep up with the weavers' requirements for raw material, so wool was sent to mainland mills for carding. But this introduced an element of suspicion, for the product was not now wholly Hebridean. To get round this, Sir Samuel Scott, the proprietor of Harris in 1900, opened a water-powered carding mill at Tarbert, Harris. In 1903, this example was followed up by a Stornoway merchant, Aeneas MacKenzie, who started a carding mill near the Patent Slip (one of Matheson's enterprises) in Stornoway. Non-profitmaking bodies (the Scottish Home Industries Association and the Crofters' Agency) began to open up more depots for the receipt of tweeds. In addition to the original depots at Stornoway and Tarbert, others were established at Obbe (now Leverburgh), Uig in Lewis, and in North and South Uist.

The Congested Districts Board also took an interest, appointing a travelling instructor who was responsible for the introduction
283 of better cloth designs and other improvements including the
*[237] flying shuttle. This latter was a distinct advantage over the old method used on the 'heart bheag' (the traditional small wooden loom), where the shuttle was a sheep's shin bone thrown by hand. The board also paid grants for the improvement of looms, and large black pots were sent to Uig to enable the people there to

ST KILDA

and to show their friends at home, that they had braved the [484]
hazardous Atlantic seas to visit St Kilda on the very edge of the [485]
world. The tourists were charitable, but this brought a psycho- [175]
logical cost in its wake. In 1886, Robert Connel wrote: 'they [155]
cannot be long on the island without discovering the great moral
injury that tourists and sentimentalists and yachtsmen, with
pocketful of money, are working upon a kindly and simple
people.' It was estimated that the islanders collectively derived a [134]
profit of 5s from each of the 200 or more tourists who arrived
during the short summer.

The new influx of cash into a community which required [486]
money as an exchange commodity because the original native food [487]
produce was becoming less saleable, hastened the decline of effort [198]
to be self-supporting. The numbers of seabirds declined [232]
steadily first, parallel ogl replaced the traditional bird oil in St [233]
Kildan lamps. The need for daily work, to toil in fellowship with [240]
others, was dissipated; the islanders could purchase more of the
food they required, provided communications with the mainland
were maintained. The population was in any case dwindling, and [141]
St Kildans became more aware of 'the other life' available on the
mainland of Britain.

Finally, on a rainy summer's day in August 1930, at a cost to [144]
the nation of little under £1,000, St Kilda was left to the care
and keeping of the changeless Atlantic. It is now preserved by the
National Trust for Scotland as a crumbling monument to a small
human tragedy of a kind that has been repeated, and will be re-
peated, in other small communities who cannot argue on the
case for their survival in terms of economic viability. The island [112]
is now occupied by military personnel in connection with the
Hebridean rocket range on South Uist.

St Kildans were described by Dean Monro, in 1549, as 'simple, [175]
poor folk, scarce learned in any religion'. In 1698, Martin Martin [51]
published *A Late Voyage to St Kilda*. He went there in the com-
pany of a minister who had been summoned to the island to de-
nounce a certain false prophet who had risen among the 180
inhabitants (pretending he was an emissary of St John the Bap-
tist. Martin found, as did later visitors, that the island community [225]
and the quality of its life were closely dependent upon its birds [225]

THE OTHER ISLANDS

[105] even to the extent that the St Kildans used their observations of
[106] the ripening of birds' beaks as compass and as omen for good or evil.
[128] Martin speaks of the islands with amusement and admiration. He
mistrust the mainlanders (and underestimate their native ways): they
were illiterate, and wondered naively at the newcomers and their
manners. 'The inhabitants of St Kilda are much happier than
the generality of mankind, as being the almost only people in the
world who feel the sweetness of true liberty.'

In May 1877, when the local tourist trade had hardly started, [176]
HMS *Flirt* sailed from Greenock with food to relieve hardship [177]
among the St Kildans, and an officer of the Highland & Island [178]
Agricultural Society on board reported that 'Tobacco was what
they invariably asked for'. The ordinary diet of the island con- [179]
sisted of, for breakfast, porridge and milk; for dinner, potatoes
and the flesh of fulmar, or mutton and, occasionally, fish; for
supper, porridge; when meal was plentiful. Seabirds' eggs, from [180]
April onwards, also formed a staple food. Tea was taken once
or twice a week and the islanders were reported to be 'rather fond [181]
of it'. There were eighteen inhabited houses, sixteen of which had
nine roofs, two being thatched huts. The sixteen new cottages had [182]
been erected about 1863, 'and are certainly much superior to the
habitations of the same class of tenants anywhere in the
Western Isles'. All were well furnished, peat was used for fuel and
there were two wheels and one clock on the island. There were [183]
some seventy-five islanders; most of the men were old, and only
two of them were unmarried, with twelve spinsters still to choose
from. Most could read the Gaelic Bible. The men were mostly tailors, shoe-
makers and weavers; every house had a loom. They made all [184]
their own clothing; the men also making the women's dresses,
and a good deal of blanketing and tweed cloth was made and
sold. Nearly every house had a spinning wheel and a large pot in [185]
which the yarn was dyed. The women were expert knitters. Each
croft and house was rented at £2 annually, sheep being charged
at the rate of 9d per head; these charges were usually paid in [186]
kind.

Feathers of the sea fowl formed the principal export of the [187]
island. The latter sold 6s per stone of 24 lb for black feathers; [188]
and 5s per stone for grey. For these he received, in Edinburgh or

TABLE 38

[189] The fertilizers used in the past were dung and sea-weed. The sea-weed, mainly
[190] tangle, was gathered in the winter months, when it was thrown in great quantities
[191] from the beach, though in the best sheltered creeks, particularly along Burness district,
[192] it was actually cut and towed in rafts to the crofts. There seems to have been little
[193] or no use of shell sand, or lime, in the past, though lime was used in the last century
[194] at Mary and possibly in Tobson, but elsewhere there seems to have been plenty for every-
[195] one. The actual gathering in March was a long, strenuous and unpleasant task. The
[196] sea-weed was then spread on the land, and left to rot for a year before being used, as
[197] an unusual selection of different types for different crops was grown: presumably it
[198] was merely gathered, mixed with dung to facilitate the rotting, and spread on the winter
[199] tillage. Dung was produced now that sheep did create no nuisance by the arrival in
[200] Eaxdeader and Lundale.

[201] Table 38 gives the current use of fertilizers and manure. It will be seen that
[202] dung is still widely used, but that lime is now used on only a few crofts, and sea-
[203] weed and shell sand not at all. The cost of carting lime to the crofts has increased to the
[204] point where it is not economic. The cost of carting sea-weed has increased to the extravagance
[205] that it is only used on a few crofts, and in the last year only on one croft. The
[206] fertilizers used are in fact, of fertilizer at all. Sea-weed is regarded for manure
[207] of inexceptionally: it is present on Little Berneray, and more particularly and of
[208] better quality on the Isle of Berneray, and on the Isle of Pabbay. Shell sand is
[209] not used because it is not available in quantity. Lime is not used because it is not
[210] available in quantity. The sea-weed is a valuable supplement to dung, and
[211] if from Burna sands, there is a township road to within about a hundred yards of the
[212] beach, but the township is unwilling to open it to the wear and tear of heavy transport.

[213] Artificial fertilizers are increasingly used. The first consideration at the present is
[214] the availability of transport, and the cost of transport is considerable for the dredging
[215] industry. The sea-weed is a valuable supplement to dung, but the dredging
[216] is not economic. The sea-weed is a valuable supplement to dung, but the dredging
[217] is not economic. The sea-weed is a valuable supplement to dung, but the dredging
[218] is not economic. The sea-weed is a valuable supplement to dung, but the dredging

t be packed for shipment. As November ends the rams 221 234 233
out with the flock.
nter is a slow season for men, but it is not an idle 221 233
The cattle must be fed. The man fetches oats or hay
stacks and some turnips or potatoes from his storage
carries the feed on his back to his cattle on the hill.
ely does he keep them in a byre because to do so he
se the government subsidy on hill cattle. Although 232
p are now free from pests and most diseases, he must
to periodically walk the hill to check their condition.
bother to feed the sheep in winter. Another task is 231
hering of a few sheep. While not quite legal until
r, one crofter justified his activity by asking,
uld we eat if we didn't kill our sheep?" Once in a
e may also kill a steer, but unless several families
e meat, salt beef becomes rather monotonous.
e crofter's wife keeps busy all winter. Her routine, 221 162
y helping at the fank a half dozen times a year and
harvest, continues through all seasons. As far as 231 241
al work on the croft goes, she milks the cows, feeds
ltry, and cultivates her garden. When she is not cleaning
se, cooking meals, making butter or cheese, caring for
ldren, or looking after her husband's needs, she knits.
does the shopping, either from a food van or on a 432
visit to Portree. Men are as disinclined to shop as they
wash dishes.

ambing season, the crofter and his family go out on the moor 221
o cut their peat for the following winter. The man uses a 241
tusker," a two-bladed spade, to cut the peat. His wife or 314
is children follow behind, tossing the peats out of the ditch 413
nd building small, loose stacks for drying. After the lambs
ave been marked and the sheep dipped in June and the shearing
inished in July, the family returns to the banks to carry
he peats to the nearest road, actually a beaten cart path,
n creels. They are then carted home and stacked near the door.
here is a growing tendency for both the part-time and spare- 314
ime crofter to give up cutting peat. It is not because coal 198
s cheaper or he needs time for other pressing chores. His 241
uxiliary occupation will not permit his devoting the necessary 469
ime to this long and arduous task. He is caught between the
raditional economic patterns and the money economy of which
has become a part.

The year for our part-time crofter, as for all active 221
rofters ends in November. By then the oat and hay harvest has 241
een stacked by the house and the potatoes and turnips stored 236
the ground, the wool shipped off to market, the surplus 233
heep and cattle have gone to market, and the rams are on the
ill. Now follows a period of enforced idleness, broken by
eeding the cattle. As we have seen many go away to find 464
ployment, leaving the care of the croft to their wives who 593
ve shared the work of crofting in addition to their own
manly responsibilities. We must turn to the spare-time 462
ofter to discover just how heavy the burden of labor may
epend upon the women of Skye.

finished lengths of tweed. For a tweed to be classified as "Harris Tweed," it must be hand-woven by Outer Hebrideans in their own homes, but the weavers are essentially employees of the mill. All the large Harris Tweed mills in Lewis, except the one in Shawbost, are located in Stornoway. A few smaller businesses, which design and market tweeds but have no elaborate machinery to process the tweed further, are scattered throughout the island.

The village of Shawbost is composed of 169 households, of which 110 are headed by "crofters," persons recognized as legal tenants of a croft. Of the remaining 59 households, 16 rent houses which were built and are maintained by the County (called "council houses"), 11 have erected houses on the crofts of relatives, and 32 have built homes on the common grazing lands. Non-crofters participate in the agricultural activities of the township. It would not be unusual, for example, for a non-crofter to serve as the clerk of a grazings committee. In North Shawbost, one croft house and two non-croft houses are used only when the owner returns to Shawbost from the mainland for a holiday. The school-master lives in a house adjoining the school, and the minister in a manse located between Shawbost and the neighboring village of Bragar.

3// There are 144 crofts in the village (nine of
241 which, in South Shawbost, were added after the turn of
[192] the century by non-crofters encamped on common grazing
[190] land who applied to the landlord for crofter status). Thirty-four (almost a quarter) of these crofts are vacant; that is, the holders of the crofts live elsewhere. One of the vacant crofts is used by its absentee
[202] tenant for holidays, and one sports a trailer (called
[192] a "caravan" in Britain) which may be rented to tourists
[193] during the summer. The rest are cultivated or used for grazing by crofters or non-crofters in the village who
[192] by inheritance or by formal or informal subletting have
[190] gained use of the land.

241 A little over half of the crofts are worked as individual units; 44% of the crofts are worked as combined units of two and three. Twenty-four men have the use of two crofts each, and five men the use of three crofts each.

16 A feature of crofting townships usually emphasized is their disproportionately large number of aged people and small number of young people, who tend to migrate to the cities. An age-sex "population pyramid" of the Highlands is not a pyramid but a top-heavy hourglass
241 (see Table 1). Most persons of child-bearing age have
[192] migrated from the area and the number of children is
[190] [see p.vii--analyst]

Chapter 2

HISTORY OF THE CROFTING TOWNSHIP

A. "Crofting"

The word "croft," meaning an enclosed field, comes from Old English. In 1563, a rental of the Bishopric
241 of Moray mentions the lease of two crofts (Grant 1930:
[192] 278). Walker (1812: 51) refers to "cottars or crofters"
[195] as subtenants of Highland farms. The word croft appears
[193] in Gibbon's historical novel, A Scots Quair, and is still in common use around Aberdeenshire. In the Hebrides, a number of Gaelic words are used to refer to units of land (e.g., faich, fearann, fiadhairt, and riannag), but the word for "croft" remains in Gaelic vocabulary as a foreign word, slightly Gaelicized as croit or lot (from "allotment").

A cynical definition of a croft, given by some academicians and administrators concerned with crofting,
[192] and supposedly first proposed by the son of a crofter,
[190] is "a piece of land entirely surrounded by legislation."
241 Crofting, as a particular method of land use, was
[192] introduced by "progressive" landlords in the mid-18th
[195] century

241 century as an attempt to reform the previous system
[192] of run-rig; but it is usually identified with the
[195] definition given it by the Crofters Holdings (Scotland)
[193] Act of 1886, as a form of land tenure to which many protections accrue. The Act defined crofts and crofting areas in Scotland, and assured the crofter of security of tenure, hereditary succession and fair rent. The legislature which followed on the heels of this act, which is sometimes referred to as the Magna Carta of the Highlands (Day 1918: 190), is mountainous. The flow stems from two perhaps incompatible aims: the desire to provide security for the landholder, and to enhance agricultural productivity. The difficulty of developing the land as an efficient agricultural unit has always existed in an area characterized by a wet climate, unproductive soil, and smallness of holdings in heavily populated areas, and was one of the factors that prompted agricultural reform in the 18th century.

B. Stratified Tenantry vs. Egalitarian Society

At the time of the break-up of the clan system in the first half of the 18th century, three categories of persons held land under the Highland proprietor or "laird": tacksmen (gentlemen farmers, often relatives

175 Thus some tenants were relatively more prosperous than
423 others. A large class of subtenants (scallags) did
428 corvée labor in return for a small amount of arable
429 land and the right to graze a few livestock. Their
114 land was intermixed with that of their masters in the
178 prevailing system of run-rig. "Crofters" had economic standing similar to that of scallags, but had permanent, compact allotments (Gray 1952: 49).

C. Joint Farm vs. "Crofting Township"

The 1726 rental indicates that the "town" of
[632] Shawbost was a corporate unit and thus that "crofting townships" have a long history. However, Geddes (1948) argues that the form of the 1726 rental was due to the method by which it was collected. In 1726, officials toured the island and made a list in large public hearings of the rents of those assembled, thereby attempting to make certain that no tenants were excluded from the
[464] rent roll. The major cooperative work unit seems to
[474] have been not the township but the joint farm, which contained enough men to make up a crew for ploughing and fishing.

In the Lothians and eastern Lowlands, the land could
191 be worked in larger units than in the Highlands, and a
241
429

191 typical homestead or "farmtoun" consisted of a
195 "ploughgate" occupied by eight tenants, each of whom
241 contributed one animal to the common plough and thus had an eighth of a share of land or one "oxgate" (Grant 1930: 97).

In the Highlands and particularly in Lewis, about
191 four to six men and their families worked together and
241 shared land which was held in run-rig. The Old
[404] Statistical Account (1796) lists 90 ploughs in the
[406] parish of Barvas or about one plough per five families (Geddes 1948: 57). Geddes maintains that joint tenants
195 paid an equal share of the rent and had equal "mounings"
429 (the number of stock allowed on the common grazing land).
191 In contrast, Walker (1812: 56) says that joint tenants
233 paid different rents according to the share which they had in the arable land, and that the number of cattle which a tenant had on the common grazing land was soumed or proportioned to his rent; all the tenants worked the arable land together, and received a percentage of the produce which was appropriate to their share. Geddes' description (1948) emphasizes equality within the joint farm; Walker (1812) and Gray (1952) point to differences between tenants and subtenants.

175 In any case, the "town" or township was not the
632 effective work unit, but rather was the larger
241 neighborhood in which several joint farms existed.
[239] The tenants of several joint farms pooled their stock on the surrounding moorland (i.e., on common grazing land).

D. From Run-rig to Crofting

Run-rig was an agricultural system suited to a pastoral people, who required the use of open, common pasture for grazing their livestock; the arable land was limited, and of varying quality (according to Day (1918: 12), 34% of the land in crofting counties was mountain and heath used for grazing, and only 36 was
[423] arable land). Residents worked several strips of different quality, and the strips (in drained beds of earth a few feet wide and many feet long called lazy-beds or fiannagan) were usually re-allocated every few
[425] years. A "constable" acting for the landlord ensured that proper husbandry was maintained.

The joint farm, and the stratification of tenants and subtenants within the farm, disappeared as
191 "progressive" landlords began, in the second half of
175 the 18th century, to substitute compact holdings for
176 the "mingle-mangle of dispersed strips (Gray 1952: 46)"
[406] which characterized run-rig. Hamlets or clachans

175 (hamlets or clachans
632 (small clustered settlements) were broken up, and
241 houses were isolated on strips of land in a more,
178 single-street villages.

114 Gray (1952, 1957) argues that the main factor
178 behind the reorganization of land use in the Highlands was the progressive, individualistic, laissez-faire ideology of the 18th century. Grant (1930: 97) attributes the reorganization to the high demand for cereals which existed during the Napoleonic wars. Highland landlords, who were very much in contact
177 with the society of the Scottish Lowlands, were
241 influenced by agricultural practices there. The trend to change run-rig, which had once dominated the whole of Scotland, to fixed, compact holdings began in the Lowlands.

According to the "progressive" ideology of the
423 time, the giving of land to individual farmers in much
428 larger pieces than they had previously held would
429 serve to stimulate agricultural development and give rise to a class of capitalist farmers. To give land to a relatively few people, however, meant the removal of a large number of tenants who had hitherto been able to survive under the system of run-rig.

175 Factors which led to further crowding were the
425 development of industry and an increased demand for
429 wool in the south, which occurred when traditional
[141] ties between laird and tenant had been loosened. The class had been disbanded after the Jacobite rebellions of 1715 and 1745; those landlords who had not forfeited their estates received huge sums of money as compensation for the abolition of hereditary jurisdiction. They had experienced travel and the luxuries of other countries, and were not eager to remain on their estates. They accepted the huge rents offered to them by sheep farmers to the south, and turned vast amounts of land into sheep tracts. Tenants
[341] were crowded together along the seashore, or lived on tiny holdings dispersed among the larger farms or on moorland, earning their living by doing wage labor.

Despite the factors which encouraged a high level
175 of population to remain on the land, proprietors
241 attempted to destroy the joint farm with its small,
178 dispersed holdings and collective rights. Run-rig
[666] agriculture was abolished in Argyll in 1776 (Day 1918: 180; Gray 1957: 49), and over the next 80 years it disappeared from the Highlands (cf. Gray 1952: 49-50), to be replaced by townships of compact holdings surrounded by undivided hill grazing lands.

25

Geddes (19u8: 56) gives evidence that joint farms were abolished in Lewis early in the 19th century. Gray (1952: 50) says that by 1819 there was little run-rig left in Lewis. The factor's notebook for Bruaraclete, on the west side of the island, shows the destruction of clachans around 1850, and their replacement by linear township.

In the Napier Commission's "Evidence" (1884) for the parish of Barvas, it is mentioned that the rent had been increased because of improvements made by the landlord, Sir James Matheson, between 1845 and 1852. Land had been divided and new townships created; and both old and new township were jotted and rented in 1850 and 1851 (Napier 1884: 999). The Ordnance Survey map drawn up in 1852-53 reveals several interesting features of Shawbost: "New Shawbost" has recently been laid out; and in an area now incorporated by only a few separate crofts on "Carnan," a cluster of houses appears, perhaps the clachan in which joint tenants lived, and from which they went out to farm their various strips of land, before Matheson reorganized the land in linear strips with dispersed housing. The peat banks in the Carnan area are almost exhausted, indicating a long period of settlement in this area.

27

three-field system with improved rotation methods involving consolidation of land. The Danish government feared that consolidation of land would have meant a reduction in taxes and fighting men.

The British government was faced with the same threat in the migration from the Highlands, as the Highlands had long been a source of good fighting men.

A reaction against the materialism of the industrial revolution developed in England as small holders sold their land to large landholders to become tenants. The Taylor Report (1954: 9) reflects the value which is still placed on country life by maintaining that crofting communities "embody a free and independent way of life which in a civilisation predominantly urban and industrial in character is worth preserving for its own intrinsic quality."

The various ante protecting smallholdings were also attempts to keep labor dispersed: to diversify and improve the use of land, and thus to increase Britain's self-sufficiency in food production. Various marketing agencies and subsidies were introduced around World War II to achieve such aims. Among the many agriculturists affected by these encouragements emanating from the central government were crofters.

31

purposes, to a community which, as an agricultural society, requires transformations from the larger society, is accompanied by patterns of specialization and individualism. The following table (Table III) of agricultural statistics for the parish of Barvas demonstrates the change, over the past 100 years, from intensive subsistence agriculture to specialized production. From a broad-based subsistence use of the croft (as revealed by the number of acres cultivated for barley, potatoes and oats; and by the number of cattle, especially milk cows), there emerges a tendency toward specialized production. The number of sheep, which require less attention than cattle, has increased since the late 1950's when the weaving of Harris Tweed commenced in earnest; and around this time there also occurs a differentiation in cultivation, between the production of barley and potatoes (used largely for human consumption) and the production of oats (used largely for feeding livestock). After 1931 agricultural returns began to distinguish between beef and dairy cattle. During the past ten years the number of beef cattle in the parish of Barvas has increased.

An important factor which crofters on Lewis now take into account when making decisions about their

[Item p.1x-4:mlpt]

32

continuing investment in crofting activities is the availability of various subsidies which, in the form of fencing grants, calf subsidies, and so on, are available to other crofting communities as well as to crofters. The certainty of support which subsidy offers is important in the decision-making of crofters because of their generally fluctuating, low-level income, in contrast to the decision-making of farmers who keep sheep or cattle on a large scale. The latter are likely to be more affected by market prices. Many Lewis crofters indicate that they would hesitate to support Britain's entry into the European Economic Community, because the higher level of prices for beef, because their subsidies might be jeopardized. Subsidies can be important as incentives for specialized production, but do not themselves sustain crofting as a sustainable pattern. And in general, despite the incentives, all agricultural production is declining in the face of more appealing alternatives available to the emerging generations.

A decline in township cultivation, or acquiesce in the individuation of agricultural practices, is another index of change in economic strategy. The fencing of individual land and purchase of personal farming machinery are everyday occurrences in the life

33

of the normal capitalist farmer in the West; but in crofting areas, these practices reveal a strain between communal and individual tendencies.

a. Fencing:

Although run-rig was replaced by fixed, compact holdings, the method of animal husbandry was not affected until the land began to be fenced. A single dry-stone dike enclosed the township, keeping livestock on the moor away from the arable land. In different parts of the Hebrides, various types of hurdles were fitted to protect both the livestock and the growing crops (cf. Owen 1958-59 for a discussion of cattle, calf and sheep herdsman in North Uist).

The township Constable had a great deal of power, which included the right to evict people from their crofts, to enforce rules of good husbandry. The last Constable of Shawbost, who died at the turn of the century, has been credited with a number of ignoble actions, such as forcing an old woman with a sore leg to take her cow to the moor along with all the others. Old widows who had no one going to the fishing and hence no means of paying their rent might be evicted in favor of other permissive, land-hungry members of the village.

34

township, but on land which had been rented and which thus provided better grazing. During the winter the sheep were allowed past the township dike, to graze along with the other livestock on the stubble of corn and barley, and mineral-rich seaweed by the shore.

After World War II, the individual croft began to be fenced, and the township dike was no longer repaired. The fact that sheep were still grazed communally on the moor means that everyone had to go out together on a particular day rather than individually, but fencing of individual land facilitated variability in land use. Less use was made of crofts for raising crops, and they could be used for grazing sheep all year.

b. Reseeding schemes and apportionments:

Another illustration of the individuation of land use is provided by comparing the number of apportionments reseeded by the Crofters Commission for lewis in the last 10 years with the number of township reseeding schemes carried out during the same time (see Table IV). A crofter may apply to the Commission for an area of land (apportionment) to be sliced out of the township's common grazing land and given to him for his own use; theoretically, his share in the township's common grazing land is reduced if his application is granted.

[Item p.xx-4:mlpt]

35

43

a crew member. Another family is called "coos," the first job which a novice had to assume when he joined the crew of a fishing boat. One of the last men to go to the east-coast fishing is about 60 now. The men came back from the fishing in time to bring in the oats, barley and potatoes, and the money was used for rent and the purchase of various foodstuffs and other goods. They usually brought enough rolls of wallpaper to cover the sitting-room or wood-lined kilh dam (black house) for another year. Twenty pounds were good wages for a mason. While the men were away at the fishing, the remaining members of the family lived on crofts from the land which had depended on the good will of their neighbors.

Many men joined the armed services, and were especially sought after by the Navy and the Merchant Marine. In 1900, there were 2,500 Lewismen in the Naval Reserve.

Around the turn of the century, until the first world war and the growth of the weaving industry, the girls used to "follow the fishing." "Everyone came to the boat to see you off. You could go all the way to Aberdeen for 1/6 on a special fish-worker ticket." The girls went from the south of England to Shetland in the far north.

For example,

a Widow Catherine lost "one red
mare and foal (£10), one dun cow (£3/10), and one dun
heifer (£1/10)." One family is said to have paid rent
by being fiddlers for "the castle" (the home of Sir
James Matheson), thus earning the patronage, "Fiddler."
Their income stopped abruptly when the fiddler at the
time, a great-grandfather of descendants now living,
converted to the Free Church and smashed his instrument.

In 1899 and in 1905 it was noted in the rent ledger
that two crofters worked "first chance of a vacant croft"
in the township.* In the first quarter of the century,
a conflict ensued between Shawbost and a neighboring
township over the extension of a cemetery; land was too
precious to have out of cultivation and give to the dead
of another village.

A 65-year-old man recalls, "Men got their living
from the land and sea. They kept more cattle when I was
young. They used the dung of the cattle to fertilize the
soil. The entire croft was used. My father's croft was
only 2½ acres, but he worked it well and harvested eight
stacks of barley to use as thrash by the year." There were
a number of kilns to dry grain, and mills along the streams
to grind the barley. The "old Norse mill" which was
recently rebuilt by the school children as a school project
was in operation from 1920-1934. "Then the tweeds got

46

53

"You got away from village life when you went to
the shelling. The youngsters ran wild. Everyone talked
about everyone else. It didn't feel like a parlay as
there—the minister couldn't see that far. Only the
young men and women in their late teens or 20's were out
at the weekends. They would send the younger ones home.
They came out in their good clothes, from Saturday night
to Monday morning. Groups of young people walked out and
back together, the girls in one group and the boys in
another, joking and teasing. They sang the old songs and
learned new ones from each other. Some were good at
making up songs. You wouldn't believe how many people
could sleep together in a single shelling. It was a
heaven on earth. Everybody was one family. The hills
were filled with the sound of voices."

Men every fall in the village went to the shellings.
Some families had enough land within the township to graze
their cattle. But they usually went out at the weekends,
for the fun and company.

One of the most important products of the cow was
not milk but dung, which was used to keep the poor land
productive. Because people did not have the enriched
animal feeds available today, a cow might not have a calf,
and thus did not give milk, for four or five years.

288 through alleys to rummage through the trash cans of
440 hospitals or other large institutions for food. The
147 occupational histories of the weavers support the
162 generalisation made by an official of the Harris Tweed Association that the younger weavers leave because they do not like the weaving and they are replaced mainly by older men who want to settle down after a life at sea. (See Appendix A for several life histories of weavers.)

B. Crofting as Strategy

•241 Because of the relatively high income provided by
288 the Harris Tweed industry, those who remain within the
423 township have tended to emphasize weaving and neglect
427 the croft.

592 1. Croft as Place of Residence vs. Agricultural Unit:
Most of the 169 households consist of married couples with
[582] their unmarried children. A tendency to marry rather late in life and for children not to marry while their parents are still living is evident in Table VI,A (Partial List of Households According to Type of Household and Age of Household Head).

Fourteen households of married couples and their children (not included in Table VI) include at least one

1. [This source as received did not contain this table--Analyst]

592 unmarried sibling. Eleven households consist only of
siblings who have never married, men and women who in
1971 were 45 years old or older. Two widows live with
[589] their unmarried siblings. Sixteen widows or widowers live alone, and sixteen unmarried persons live alone.

•241 The large number of households occupied by single,
592 elderly people reflects the use of the croft as a place
423 of residence rather than as an agricultural unit, a
427 view of the croft that was given legal expression in
488 1958 by the Miscellaneous Provisions Act. Before 1958,
[423] the croft went automatically to the eldest son if a crofter died intestate. Since 1958, the rights of different claimants must be considered and tenancy by a new person must be confirmed. District and county councillors argued for this change, saying that a widow was often left on the croft and her security endangered because the eldest son was usually far away from the island, in Canada or some other country. In other words, rather than an agricultural unit which should naturally be taken over and worked by the male head of the household, the croft is seen as a place of residence for the infirm and for the aged, and especially for the aged female.

The Crofters Commission has suggested that elderly
459 people be allowed to rent small plots of land on which
185
423
483
488
311

459 their houses are located, and that most of the land be
185 freed for use by more active crofters, but the ideology
423 associated with possession of the croft makes such a
483 plan extremely difficult to implement. "The croft is
311 your base, the only thing you have. You don't want it taken away, even if someone else is using it already anyway. Our county councillor suggested amalgamating the unused crofts at a recent meeting. No one said anything, but no one wants it."

Of the five households that have the use of three
592 crofts each, one consists of a bachelor who uses the
•241 crofts for grazing a large number of sheep. A second
311 household is composed of two brothers who had stayed at home to take care of their aged parents. One of these brothers recently married, after the last parent died. These men keep cattle and sheep, and both weave.

A third household is headed by a married man who
592 has recently sold most of his livestock in order to
241 "concentrate on the weaving." His father, who used to
311 haul peat with a horse and cart in exchange for the
288 use of grazing land so that his family never had to go to the shellings, died a few years ago. "My father was a crofter only. The weaving didn't start until the 30's. He was wounded in the war. He got a pension and sold a cow or a few sheep each year. But I didn't

592 like to leave the loom for the time it took to look
•241 after the sheep."
311
288

A fourth household consists of three unmarried
592 siblings in their 40's and 50's who recently sold their
241 cattle and now keep only sheep for their own consumption.
241 They cultivate a small amount of oats and hay to feed
[233] the sheep during the winter. The brother who was largely
[246] responsible for taking care of the livestock is now
[288] "concentrating on the loom," and his brother works in
[443] the mill. Their sister, who used to work in hotels on the mainland, now keeps house for them. Described as a "self-contained family," they have a tractor and a deep-
[408] freeze and take care of their peat and the harvesting
[464] of crops by themselves. One of their crofts has become
654 too waterlogged even for grazing and was sold recently
423 to the son of a local crofter, not for agriculture but as a prerequisite for applying to the Department of Agriculture for a housing grant. Only tenants of crofts can apply for such grants. As this particular croft is too wet to be cultivated or used as a house site, the only motive which the new tenant has to become a crofter is to gain access to governmental subsidy.

The fifth household is composed of a retired couple
592 and their son and his wife and family. They have no
235 cattle, and use the crofts for grazing sheep.
311

•241 The competition between the loom and the croft is
288 evident in the few communal township practices which
169 still exist. One of the rules of township organization
235 is that all households must bring their sheep in from the moor on the same day. Other rules are that no one
[231] should go out on the moor at any other time with a dog, and everyone who has sheep should go out on the day designated by the township grazing committee to collect them. The moor is extensive, and the sheep wander over a wide area. Only if a large number of men go out together and come in with their dogs like a wide net can the sheep be brought in with a minimum of effort over the stream-cut, uneven ground. Anyone who goes out alone disturbs the grazing animals and probably drives them farther away from the village.

These rules have strong ethical import and are
233 much more than a set of procedural rules prescribed
183 by the Crofters Commission. "There is a code of ethics which you learn as you grow up, as you go with your elders out to the moor. You can fight with a man over
[578] a woman and make it up next week; but if you fight with a man over a sheep, you won't make it up for thirty years." That these rules are weakening in importance
[198] is indicated by situations in which only two or three men have gone out in the early morning to bring in the

233 sheep were let out of the pens, and a fight broke out
178 between the two groups of people.
578

•241 1. Crofters vs. Non-crofters: Another division
659 within the township has developed largely because of
598 the attention paid by outside agencies to "crofting."
115 The Crofters Act of 1886 defined crofters and gave them
[571] a protected, privileged status. In fact, very little distinction existed between non-crofters (sometimes called squatters and/or cottars) and crofters, and in some places, such as the Isle of Scalpay, non-crofters even out-numbered crofters. Both categories were linked to each other by bonds of kinship and mutual dependence. Non-crofters were in fact favored economically. They did not have to pay rent, but had the same opportunities to graze stock
241 and plough land as did crofters. Many crofters themselves
195 had buaile, units of land not recognized as part of the
423 croft and not included in the land for which rent was paid but recognized as property by the villagers themselves to the extent that these bits of moorland passed down through families or could be given by one person to another. Even today, a young girl thinking of getting married says her future husband might build their house on her father's buaile, and a man may build a house on moorland "given" to him by his wife's aunt. Officially, a non-crofter had no "rights" to a house which he built on the common

•241 grazing land and he could not transfer such property in
115 a will. Similarly a crofter had no right to his buaile,
423 and could not formally protest if another crofter sought to apportion this land for his own use (see Chapter 2 for a discussion of apportionments). But in both
[627] situations, informal understandings superseded legal rights.

Various legislative acts which followed the 1886
241 act focussed attention on the crofter. Various matters
659 associated with crofting are handled by a Crofters
115 Commission. Crofters have access to grants and loans
[654] to improve land and build fences and homes. They may
[198] buy goods at low prices in a nearby cooperative store. As crofts were fenced, land around the townships became scarce and non-crofters found it difficult to keep large numbers of cattle and sheep.

Within recent years it has become possible for non-
241 crofters to gain title to the small plots of land on
178 which their houses are built. Some loans are available
423 to them for building houses. Non-crofters have access
[452] to the various subsidies available to all agriculturalists
[654] such as the subsidies for raising hill sheep and beef
[324] cattle. There is still the feeling, however, that crofters have rights which non-crofters do not have and that in conflicts over scarce goods crofters have

241 the edge over non-crofters. "Squatters can do what
178 they like, cut peats, put sheep and cattle on the common
423 grazing, but this is a privilege, not a right."
827

The clerk of a grazings committee says, "When it comes to an argument between a crofter and a squatter, the crofter always wins. A squatter has rights only with the grazing committee's permission. If one crofter disagrees, the squatter is out."

241 A squatter muses bitterly, "I wanted crofting status
423 because I wanted to get a Department of Agriculture
578 grant to build a house. I work on the peat road; I go to all the fanks. But at a township meeting, they didn't want me to get crofting status. They were afraid I would start grabbing peat banks or apportionments in the common grazing or something. There's your brotherly love for you."

311 4. Subsidies: In the section entitled "Changing
654 Land Use" I suggested that the availability of subsidies has encouraged a more specialized investment in agricultural activites.

654 The villagers are keenly aware of outside institutions
829 which give money. They speak to each other about forms
241 which they receive from the Department of Agriculture and the Crofters Commission, in much the same way as they are curious about the number of tweeds which another

654 person has. The gigantic bureaucracy of government
829 agencies is mysterious and unpredictable. One can
241 never be certain when or for what reason another economic increment may come. "I used to throw away a form from the Department of Agriculture until I found out from somebody that you could get money with it. You say you're planting so much of your land in oats, and later you fill out another form saying you didn't get a very good return, and they send you a deficiency payment."

For some crofters, the requirements of the subsidies
241 have affected the extent and techniques of agricultural
242 activity. For example, one man used to work his land
654 in the way that his ancestors learned would bring best
178 results: lazybeds were aligned in strips that would drain well and catch the sun, and stones were left in the soil to capture the sun's warmth and thereby facilitate the growth of potatoes. Now he has merged the separate strips, cleared the stones, and divided the land into units that allow him easily to calculate how much he has used for what crops, because to be eligible for a particular grant, a certain percentage of arable land must be ploughed with grass seed and rotated with other crops.

241 The Department of Agriculture and the Crofters
654 Commission often overlap in their subsidy-giving functions.

241 The Department of Agriculture dispenses subsidies to
654 all Scottish farmers, not just to crofters, and handles about 210,000 claims per year. Lewis produces 0.4% [433] of the agricultural output of Scotland, and 8.1% of the agricultural output of the Scottish islands.

654 The major subsidies available to Scottish farmers,
233 including crofters, are for raising hill cattle, beef calves, and hill and upland sheep. Sheep and cattle subsidies were made available in 1941, in the early years of the war, to increase their production. During wartime, Britain was more dependent than formerly on her own resources, and attempted to encourage production. Between [458] the two world wars, agriculture had undergone a recession, especially in the hills and uplands, because of a number of events in world economics, such as competition from New Zealand and Argentina in production of cattle. As part of the scheme of the postwar Labor government, agricultural support was made statutory.

For example, a man who keeps hill cattle may receive L16.70 per cow as well as L5 for each acre cultivated to feed his cattle during the winter. He receives L5 for each cow which is tested for brucellosis. In the 1970-71 agricultural year, Shawbost received over L2,000 in sheep and cattle subsidies, divided among 37 men receiving subsidies for cattle and 36 men receiving subsidies for sheep.

654 Subsidies for fertiliser and for lime to neutralize
241 acidic soil also originated during wartime, when the government was trying to control scarce materials. Agricultural subsidies in the form of cropping grants and improvement grants are available both to crofters (from the Crofters Commission) and to others of the same economic status as crofters (from the Department of Agriculture). Most of the improvement grants are for fencing (rather than drainage or other improvements). To receive a cropping grant, a farmer must sow one-third of all tilled acres in grass, and apply three hundred-weights of fertilizer to each acre planted with oats, barley or wheat. Lewis is in the third or poorest category of agricultural land designated by the Department of Agriculture, and receives the highest rate of subsidy (L11 per acre, as opposed to L5 per acre for good land).

For some people, even the incentive of subsidies is not sufficient to stimulate them to farm or keep live-
654 stock. "It's too expensive to work the croft. There's
241 not enough return to make it worth it. The Department
829 of Agriculture gives you a subsidy for fertilizer, but it still costs you something if you're not doing much of anything else with the land. The croft is a sideline; it helps you keep busy; you grow some of your own food. But you've got to make a living some other way."

233 One crofter who gets subsidies says that he keeps
241 sheep and ploughs the land to feed them only as a "hobby."
654 He uses the word "hobby" because, in comparison with the
523 income he gets from working regularly in the mill, he
434 does not get a good return for his investment.

A crofter who has been weaving all his life says
233 that the income he receives from his cattle and sheep
288 does not compare with the income he receives from weaving.
434 Subsidies are counted as an important part of the income
654 he receives for the livestock. "Last year I got L28 for a heifer--not a very good price, but then I got an L11 subsidy as well." He does not believe that anyone could
829 make a living from crofting alone. "You say some of the
434 people in Uist are able to make a living at it? They might be getting social security as well, they're that sly. Anyway, members of the family are probably sending money home from sea or from the mainland. You need a weekly wage. If the tweeds disappear, the only thing a man could do would be to go to sea." (See Appendix C for an example of the balance sheet of a croft.)

233 A few families work seriously at rearing cattle for
463 sale in local or town markets. These are usually composed of several male adults, of which one or more work in the mill or do weaving and someone is largely responsible for croft work. Most of these people look

F. The Decline in Self-Sufficiency

175 Until the second world war, when weavers began to
632 earn larger sums of money for their weaving, the
433 township was relatively self-sufficient. The land was
175 more thoroughly cultivated, and the village boasted a
463 number of local specialists. These specializations
241 were linked with particular family lines. Certain
175 families were blacksmiths; others were undertakers,
463 joiners, cobblers, or midwives. As generations succeeded
592 one another, occupations were not thrown open in the competitive, individualistic way of the mobile city. Certain occupations were seen to be "naturally" linked with particular families. Sometimes it was said that people of a particular family (which might include quite a number of collateral lines) had hereditary characteristics which suited them for particular occupations.

"Taggy was an expert bone-setter. He wasn't a doctor
[159] at all, but he could set bones better than any doctor. And he used to let blood, when people were dizzy with threatening strokes, or had pneumonia. It was in the people. He was a direct descendent, through his mother,
[820] of the Murrays of South Shawbost, the people who had the mill and were the blacksmiths for generations. He got that ability from them."

651 which official records are kept by the mills. If you
434 say jokingly to a fisherman who has brought in a large catch that he should put some money aside for the income tax man, he is likely to reply, "He'll have to
463 catch me first." A tradesman may be earning large sums
434 of money doing local work as a skilled specialist at
[745] the same time that he is collecting social security.

A man may move in and out of a number of different jobs,
[171] and never report his income. "Occupational pluralism" (cf. Brox 1968) rather than economic specialization has developed as a strategy in various countries along the North Atlantic fringe, such as Iceland, the Faroes, northern Norway and Newfoundland, as well as the west coast and islands of Scotland. In these marginal areas, income from specialized occupations is, in the long run, unpredictable and inconsistent.

178 In times of national economic depression, strikes,
458 shifts between socialist and conservative governments,
241 and other crises, crofting provides an alternative
175 strategy. During the last war, many islanders who had
782 left the island (including some who had been quite
166 prosperous in the cities) returned to spend the duration of the war in the village, glad of the relative security provided by the relative abundance of food and less strict rationing. During a huge snow-fall that occurred on

241 178 Crofting constitutes a dormant strategy which can be mobilized if deterioration of land has not proceeded too far, and if the skills of land use are not lost by succeeding generations who have grown up in an environment which presented them with more appealing strategies.

B. Social Marginality

166 464 1. Linguistic Distinctiveness: Social marginality began when the Highlander had to leave his place of origin and go to the cities of the south in search of [197] employment. The feature which most distinguished him was his Gaelic speech.

101 186 648 In Glasgow the common word for Highlander is "teuchter," a slang word with derogatory implications which, according to one theory, developed when Gaelic speakers coming into English-speaking cities mispronounced the word "sugar" so that it sounded like "teuchter." [829] (Glasgow Highlanders have developed their own defensive explanation: when the civilized Highlanders came down among the uneducated barbarians of the south, they came as tutors, a word which their uneducated Lowland pupils mispronounced.) According to a university student from the islands, the word was once used by the English to refer to the Scottish Lowlanders.

166 The image of the island
484 as spiritual home is fostered by The Stornoway Gazett
823 and by nostalgic songs, most of which were written by
204 islanders who emigrated to Canada in the first quarte
[533] of the century.

632 The crofting township as a strongly bounded netw
● 241 continues to exist, although crofting as a socioecono
pattern which evolved in a situation of limited socia
and geographical mobility, low cash reserves, and the
restriction of a large population to a region of limi
resources, is very different from crofting as define
an office in Inverness. As far as the crofter is con
cerned, to be defined as a crofter by the Crofters C
and other government agencies is to have access to
resources which affect the environment in which he m
his choices.

241 The individual is faced with the semi-security
288 crofting and weaving, in contrast with the exciting
risk-laden opportunities offered by the dominant urb
[654] industrial mainland. Crofting and Harris Tweed have
protected by government legislation. Various subsid
[745] and loans are available. In times of unemployment,
security is available. Extremely important as contr
621 to boundedness are the non-economic incentives: the
156 individual has a place in a human community; he is

233 234 435 434 648 costly, that the Common Market will soon drive up milk prices, and that income from the weaving has become too uncertain.

412 178 Many tools and techniques associated with crofting have disappeared: the flail for threshing oats (two pieces of wood joined with leather); the sheepskin stretched over wood with holes burned into it, to separate chaff and grain; rope made of plaited heather and straw. 241 [221] [237] [824] [173] [887] Each spring the byre was cleaned of its accumulated dung and urine, and this was turned into the ground along with seaweed. Such tools and techniques remain among the older villagers as a "memory culture" which may be mobilized under changed conditions, as when alternatives to crofting are no longer available or are too costly. However, the longer crofting is neglected, the less it will provide an alternative strategy. "The artificial 241 824 fertilizers are ruining the land; that's why the turnips are full of maggots and the potatoes turn to [233] water." As the rushes grow and clog the drains and streams--rushes that used to be eaten by the horses and cattle and which are now left untouched by the sheep--the land becomes unfit even for grazing. "I'd rather work the land than the blinkin' loom, but we tried the potatoes, turnips and cabbage last year, and lost them all to the maggots. You lose heart after that."

Conclusions:

Summary and Theoretical Considerations

A. Summary

105 Crofting townships of the Highlands and Islands of
[131] Scotland are within a few hours' travel of the major citi
[484] of Britain. An extremely high percentage of the young
[873] people in the crofting counties attend universities and
other institutions of higher education. Politically,
[641] administratively, economically and in other ways, the
crofting population participates in the larger urban-
industrial society of Britain.

105 Despite this participation, the township-qua-village
632 community is a relatively strongly bounded system. This
62 thesis investigates factors contributing to the strong
[121] boundedness. From a relatively self-sufficient economic
105 unit using agricultural practices suited to the extensive
178 cultivation of marginal land by smallholders, the townshi
632 has during recent decades changed to one dependent on
241 goods and services provided by the larger society.

105 Crofting activities nevertheless persist, in part because
241 of the incentives offered by government bodies such as th
654 Crofters Commission and the Department of Agriculture. T

654 land is one reason that the larger s
[311] to exploit the land. The Crofters H
[671] and subsequent legislation ensured p
incentives for continued maintenance
the crofting township.

AGRICULTURE AND FISHING

conditions backward. He tells us that the Island of Lewis had been fruitful in corn until late years of scarcity and bad seasons. The crops were barley, oats, rye, flax and hemp. The natives showed great industry in digging the ground with spades—a practice which he invariably associates with a large return. He even records that the abundance of corn had once been such that it encouraged them to 'brew several sorts of liquor'. For manure, sea-ware and soot were used. And harrows had two rows of teeth and rough heather in the third row. Pennant's visit to the island in 1772 found that the produce of the land was insufficient to support the population. Distress was rife.

In Martin's time, although the economy was more or less self-sufficient, a certain amount of produce was available for export or for translation into 'several sorts of liquors, as common usquebaugh, another called trestarig id est, three times distilled, which is strong and hot.' One assumes that this produce was surplus to the requirements of the island's population. The livestock consisted of 'cattle, horses, sheep, goats, and hogs'.

TACKSMEN AND TENANTS

Most of those who held land had leases: tacksmen, who paid rent for large tracts of land and who, by settling suitable tenants there, received rents, in money or in labour, as an additional income from their farms. These smaller tenants had no leases: they could not write and were subject to the tacksman's favour. In the early eighteenth century, the rental rolls for Lewis, preserved among the Seaforth Papers in the Register House in Edinburgh, show that most of the tacksmen—sixty-four in number—were MacKenzies, indicating that they were adherents of the Seaforth (MacKenzie) family on the mainland, who had received the lands from royal hands as the reward for their fidelity. The smaller tenants, who generally lacked surnames but were known by their personal characteristics, numbered over 200; there were also above eighty tenants in Stornoway.

Rents were paid either in money or, more often, in meal, mutton, sheep, butter, tallow or salmon. When it was proposed to sell the Seaforth estate of Lewis in 1772, particulars of the Lewis

TACKSMEN AND TENANTS

rental were published for the benefit of intending purchasers, a value in sterling being placed on the items:

Money	£713	3	3
Oatmeal, 256 bolls	89	2	2
Sheep, 228	25	6	8
Butter, 173 stones	28	19	7
Tallow, 7 stones	1	3	4
Salmon, 1 barrel	3	0	0
Total =	£860	15	0

The most important event in the agricultural history of the island at this time was the introduction of the potato. Though the exact date is not known, some evidence from the writer on Lewis in the *Old Statistical Account of Scotland* (1796) places it about 1757. 'With the utmost difficulty . . . the people were prevailed on to plant potatoes, but of which they now plant great quantities by the plough and by the spade, and find them to be the most useful of all crops raised in the Parish.'

The substantial tacksman seemed, in Lewis, to deal kindly with those who called him Fear Baile (Town Man—almost a mayor, without the trappings and self-elected). Serious complaints against tacksmen are few. But winds of change were blowing. John MacKenzie, who had for some years been Chamberlain of the Lewis Estate, was examined before the Napier Commission in Edinburgh in 1883. He knew the island's history well.

> Till the beginning of this century, the greater part of the Lewis was in the hands of tacksmen, or middlemen, who got in some cases from their sub-tenants in money, produce, and labour what nearly paid their rents. There were the MacIvers of the Parish of Stornoway, the Morisons and Murrays of Barvas, the MacAulays of Uig, and the MacLeods of Lochs. When Mr Stewart-MacKenzie married the Hon Lady Hood, daughter of Lord Seaforth, and took the management of the estate into his own hands, he did away with the middlemen and let the land directly to the crofters. This, no doubt, was a step in the right direction, but it had its disadvantages, as the example of a good middleman, who looked after his people, and who was industrious in farming and attentive in stock-breeding, was beneficial to the people, though in some cases they may have been petty tyrants.

CROFTING CHANGES

The removal of crofters from good to poorer ground was a significant factor in the destitution years of the nineteenth century, with the self-sufficiency factor becoming smaller and the dependence on imports (when there was money to buy these) increasing. Today, the crofter is of course not self-supporting, his economy being based on fishing and weaving with the produce of the croft yielding an annual average of some £200.

Acreages under certain crops show this trend to dependence on the produce of mainland farmers. In the island in 1911 some 3,673 acres were under potatoes, the present acreage being about one-third of that. The number of people per acre of potatoes for Scotland as a whole is 22 : 1. In the island it is about 15 : 1, indicating a heavy domestic consumption. Yet substantial imports of this crop are required to satisfy demand; a relevant point is that the milking cow commonly shares the potatoes. The barley crop, once much used in Lewis's former small distilleries, has been reduced to some 10 per cent during the past fifty years. On the other hand, the acreage of sheaf crops, oats, rye and mixed corn, generally fed to cattle, has about doubled. Oats in particular are in favour for cattle fodder; even before the turn of the present century oats were not widely used for human food, and oatmeal has for centuries been imported into the region. The turnip acreage has halved over the past fifty years, perhaps the result of the gradual disappearance of the horse, its steady labour and its dung being required to put good heart in to the land.

As the crofters' cropping policy has changed over the past half century, so has their animal husbandry. Animals are a main selling product, particularly cows and sheep. Horses, of course, have been drastically reduced from their total of 1,672 in 1911, as tractor, lorry and van have taken over their work. And though some cattle are raised, the numbers are now about 60 per cent below those of 1911. At that time the density of cattle per 1,000 acres was heavy (46-60) in the north-east of Lewis, less (31-45) in the north-west, and still less further south. The present average is around 18 beasts per 1,000 acres. This decline, in particular in the milk-yielding animals, has compelled Lewis to import 1,000 gallons of milk a day from the mainland.

It is sheep which today claim pride of place on the croft, valued

AGRICULTURE AND FISHING

for mutton and for wool, the right type for translation into Harris Tweed; the predominant breed is the blackface, whose fleece is hard, wiry and long-lasting. The demand for raw wool has also encouraged larger flocks among crofters in such places as Barra, where virtually no weaving is done in the immediate locality. In general there has been since 1911 a 40 per cent increase in the livestock carried on the island's crofts, about twice as big a rise as found anywhere in the seven crofting counties of Scotland.

In an attempt to reduce Lewis's milk imports, in 1962 three crofters at Garrabost on the Eye Peninsula combined to set up a small dairy farm using the lands of their three crofts. A new dairy byre and dairy premises were built and equipped with the necessary electrical equipment. Grants were given by the Department of Agriculture & Fisheries for Scotland, the Crofters Commission, and the Highland Fund Limited. The first year of operation was closely supervised by the Lands staff of the Department at Stornoway and guidance given as necessary. The milk is retailed in Stornoway and district and amounts to about 5 per cent of Lewis's daily consumption. This little scheme has shown that the island could with some organised effort become independent of milk imports, which have been estimated at upwards of £100,000 worth per annum. Over £70,000 per annum is also spent on imported butter and cheese.

In 1947 the number of crofts in Harris and Lewis was 4,020. In 1971 the figure was 4,146 (3,592 being in Lewis), representing a slight increase in a quarter of a decade. Thus, crofting as a land use activity in the island provides a fairly stable element in the economy, although it is subsidised by the crofters' participation in the fishing and tweed industries. A crofter, it should be mentioned, is often a tenant of more than one croft, working them together as a unit. These units vary in size, the greatest bulk of them (about 60 per cent) having up to 5 acres of arable land. About 2 per cent contain over 30 acres of arable land. In recent years there have been proposals for the better use of the reclaimed moorland, particularly for cattle-raising, which would offer the crofter an increased cash yield from his interests. The annual reports of the Crofters Commission indicate, indeed, that the trend to the small croft obtained from the fragmentation

CROFTING CHANGES

of larger and more economic working units of over 30 acres of arable land is also apparent in the southern Hebrides, the west mainland of Ross & Cromarty, Argyll (mainland and islands) and Caithness.

The acreage of common grazings held per holding varies from under 50 to some 200. The crofts, as already mentioned, are in townships, of which the island has 168, half being fenced and half consisting of individually fenced crofts. During the winter most of the crofts are laid open for winter grazing by sheep of general ownership. Manure resources are mainly dung, seaweed, shell sand and of course artificials where necessary.

A new aspect of crofting in Lewis is its extension into forestry. A recent survey by the Forestry Commission indicated that under 400 acres of the land not being used for crofting were suitable for afforestation, and that these acres were made up from twenty-three different plots. At Garynahine Estate can be seen the beginnings of a real afforestation unit of some 500 acres, a scheme of the utmost significance for the economic future of Lewis and for the relationship between crofter and landlord. Too often in the past this relationship has been biting, hard and inflexible; in particular the crofter was understandably unwilling to release good land for planting trees. But the crofters of Callernish agreed that the right of usage of 285 acres of the common grazings belonging to their township should revert to the landlord, this land being thrown in with 220 acres of the Garynahine Estate. Labour comes from the affected township and others in the area.

FISHING

Early beginnings

It is the humble herring that has contributed so much to the island's economy and its history. At a very early date in history, the Hebridean fishings were worked by Frenchmen and Spaniards who must have found them rich enough to repay the long journey and weeks away from home in the cold Minch waters. It was not, however, until the end of the sixteenth century that the wealth of the Minch was really discovered, this time by the fishermen on the mainland of Scotland who copied the tricks of their trade

THE GAELIC LANGUAGE

ing, 73 per cent have the language, which has been introduced by immigrant country folk and their descendants.

HEALTH AND HOUSING

Despite the harsh conditions of centuries, the physical health of the island was good in early times. Epidemics were rare due to isolation, though on occasion smallpox carried away many children. The commonest diseases were fevers, jaundice, dysentery and diarrhoea. Bloodletting (as in many another more advanced community) was the usual cure for fevers and dysentery. For coughs the people took a 'brochan' or soup of roots of nettles and reeds boiled in water with yeast; the meal of a black bean, mixed with boiled milk, was a useful cure for dysentery. Reports describe the folk as being well-proportioned, free from bodily imperfections and of good stature; healthful and strong-bodied.

But privations, particularly the frequent recurrences of near-famine, coupled with the primitive housing conditions, began to take their toll. The increasing sickness rate aroused the concern of authority. The most primitive dwellings had but one room, with the cattle at one end and the family at the other. In 1830 Seaforth sought at least to put an end to this, ordering that a partition must be erected between beast and man, 'and that more light should be admitted into the dark recesses of their habitation'. This type of one-room dwelling was not confined to the island, being found with many variants throughout the Highlands and Islands area. The old Lewis house was, as a rule, an oblong structure, varying in length according to the means and requirements of the occupier. It had but one door, and frequently had no windows. Chimneys did not find favour, mainly because any opening for the escape of smoke from the centrally-sited hearth tended to reduce the quality of soot produced; and soot was regarded as a valuable manurial product. If there was a hole in the roof to admit some light, a small pane of glass was fixed into it: this soon had a coating of soot, and the sole source of light was the doorway—when the door was open. The family and the cattle used the same entrance; and the cows' dung was removed once a year in the springtime.

Cultivation for subsistence is minimal, and in part stems from government-defined privileges and duties regarding maintenance of a croft. The Harris Tweed industry, which is restricted to the Outer Hebrides and thus is protected from competition, has provided work for a large number of islanders. Many of the younger members of croft families live in cities on the mainland, and send part of their wages home; they return regularly to the island, and many plan to retire there. Thus the township supplies urban workers who remain very much attached to the rural townships, which are composed of aged family members and a rural proletariat. The standard of living is high, and many crofters have accumulated savings, although much of this surplus is used by the men for alcoholic drinks.

In Britain, rural communities have been interpreted as lying somewhere along a rural-urban continuum (cf. Southall 1959, Frankenberg 1966). In 1959, Southall presented "an operational theory of role" by which he suggested that heterogeneous societies may be analyzed and compared. He developed the concept "density of role texture" to describe societies which lie along a continuum from rural to urban. Frankenberg (1966) uses Southall's concept along with other concepts to present a more complete model of an urban-rural continuum. The "models" of both Southall and Frankenberg are essentially lists

Appendix C

Balance Sheet of a Croft

"The Muillear" has one croft and a two-acre buaile. In 1970 he planted one-eighth of an acre with three bags of potatoes, two of which he bought for L14/16, and harvested 22 hundredweights. This was sufficient for his family's needs and provided some feed for his livestock for all but two months of the year. A small plot is planted with cabbages, for domestic consumption.

Seven-eighths of an acre is planted with oats; one-and-a-half acres with grass and hay; and two acres are used for rough grazing.

The Muillear is interested in new ideas and techniqu He goes to meetings and discussion groups sponsored by th North of Scotland College of Agriculture, and has bought prize rams from the mainland to improve his flock. He tries to raise a few sheep using techniques of good husba rather than a large flock which would be given less effective care. He is teased by other crofters for "over feeding," and for keeping his sheep on the croft and the township reseeding rather than out on the moor. "His she get homesick when they get out of sight of the croft." H wins the prizes at the Carloway Cattle Show each year, in

*159 232 233 quietly triumphant yet unassuming way. He does not kill any of his sheep for home consumption.

*159 241 288 434 His involvement with the croft is a "hobby" because its output does not compare with the income he receives from weaving. Whereas he might make as much as L100 from his crofting activities, his income from weaving averages [651] L7-800 a year. As a married man, he can earn as much as L848 without paying income tax.

*159 233 434 654 Income:

Sheep:	L27/--	(three sheep sold to the slaughterhouse in Stornoway)
	1/16	("Fat Sheep Subsidy" for the three sheep that were sold)
	16/10	(Subsidy of 12 shillings each for 11 shearlings and six sheep)
	22/10	(Prize money from the Carloway Cattle Show)
	12/10	(Three lambs sold locally)
	12/ 8	(Fourteen fleece sold to the Wool Marketing Board, at an average of 3/11 per pound, or about 17/6 per fleece. The island tweed mills pay only 2/5 per pound. He has been sending his fleece to the Board for two years. Many crofters prefer not to bother with the Board, and sell their fleece to the mills. They are the only sheep-owners in Britain who have this option, because of the location of the Harris Tweed mills on the islands. But as of 1970-71, the mills refused to buy fleece.)
	L90/14	

*159 233 434 654

Cattle:	L28/--	(Calf sold)
	11/ 5	(Subsidy for the calf)
	18/ 5	(Subsidy for the cow)
	L57/10	
Total:	L165/14	

*159 435 246 Costs:

L50/--	(Fodder used from December to August; a hundredweight bag costing L2/14 is used almost every two weeks. Other crofters do not use this much.)
8/--	(Stack of oats)
6/ 8	(Oat seed for 7/8 acres)
6/--	(Tractor hired)
9/--	(Six hundredweights of fertilizer for oats and grass. For a cropping grant of L17/10, three hundredweights of fertilizer must be put on each acre of hay.)
L79/ 8	

[427] [407] [241] [654]

*159 434 435

Income:	L165/14
Costs:	79/ 8
Profit:	L 86/ 6 (or about L2 back for every L1 he invested)

*159 434 Net cash income or profit from the croft thus represents 9% to 10% of his gross earnings from weaving. If computed as cash, uncalculated income from the croft in the forms of garden vegetables and milk products would raise the croft income by L30 to L40. In those households that consume their own sheep, the croft contributes an even greater amount.

136 coasts there is a wonderful richness—one might well spend an
137 hour or so with J. A. Harvie-Brown's *A Fauna of the Outer Hebrides*. The Hebrides area is one of the twelve faunal regions of Scotland, and is becoming increasingly the spotting-ground for amateur and professional ornithologists. They see birds such as the skua and red-necked phalarope, breeding at the southernmost limits of their range. The golden eagle, corncrake and red-throated diver, though found in other parts of Scotland, are more plentiful in the region because of the low incidence of human interference; buzzard, merlin and peregrine falcon are also found. Many birds are peculiar to the area: there are Hebridean subspecies of twite, dunnock, song-thrush and wren. Since 1962 the blue tit has begun to colonise the Stornoway woods. And 1960 saw the first arrival of the collared dove, an incomer which, like many a human, has taken a liking to the place and settled down to establish its flourishing community. On Gallows Hill, a low rising overlooking Stornoway, is a large rookery; rooks first reached the island in 1893. Jackdaws arrived at the turn of the century and are now quite numerous. As might be expected, the adjacent harbour and foreshore of Stornoway provide a suitable area for purple sandpipers, turnstone, heron and redshank. Gulls abound. The estuary area just north of Stornoway is the haunt of widgeon, shellduck and teal, among many other birds; a ruff was seen there in 1956. Melbost beach has the largest ternery in the islands, with arctic, common and little terns sharing life together.

The birds on the shore line are mostly waders, divers, ducks and seabirds. Cormorant, shag, gannet, fulmar, arctic skua, terns, gulls of all kinds and oyster-catchers can be found. The full variety of the island's bird life can be seen by visiting not only those sloping lands to the sea, but the cliff-tops, which often have their own numerous bird colonies. The sea's edge, with the push-pull tides, is indeed another area with abundant life of all kinds. Bladderwrack *(fucus vesiculosus)* and knotted wrack *(ascophyllum nodosum)* are there in great quantity, the latter now a significant factor
137 in seaweed-processing activities (Chapter 6). From time im-
324 memorial, seaweeds have been a natural resource in the island's
241 economy, used as manure to supply the necessary element of organic matter to keep the land in good heart. Keeping the sea-

For a number of years it had been the practice for a consider- 175*
able proportion of the older schoolboys during their attendance at 702
the Secondary School to put in their training with the local body 704
of Territorials—the Ross Mountain Battery. At the School Prize-
giving of 1914, these boys attended in their uniform to be ready
to go off the same evening by steamer en route for the annual
training camp. Before the School re-opened, the Territorial Force
was mobilised, and for some of these lads there intervened four
long years of toil, of fighting, and of sickness overseas, before they
ever saw their homes again.

Later (1938), the unit became the 203rd (Ross) Battery of the 51st (West Highland) Anti-tank Regiment. It was whilst fighting as an anti-tank battery that, with other units of the 51st Division, the men were taken prisoner at St Valery in 1940. Today, after more changes, the battery is the oldest in 540 LAA Regt (Ross, TA (the Lovat Scouts). In 1960 the Ross Battery received the Freedom of the Burgh of Stornoway in recognition of a century of voluntary service to the community and the nation.

LAND USE AND CROFTING

241 •
614
182
311
175*

The history of land use and the crofting system in the Highlands and Islands (see Chapter 5) is full of difficulties. In the older days of the clan system, before the rot set in, though the clan members belonged to the chief, they also belonged to the land and the land to them. In such a climate, the agricultural system, for it was such then, was in a reasonably healthy state; the land was worked to the full. Good land was available for the support of the clan, and as often as not in good years there was ample produce, crops and livestock, to send south to well-paying markets. That fertile lands abounded is indicated by the reports of visitors in various centuries. But times changed. The increase in population after the breakdown of the clan system by statutory legislation, and the policy of population placement carried out with a rigorous enthusiasm, planted seeds of discontent—in particular a hunger for land. The land was in any case becoming ever more inadequate to support those already on it.

The story of the agrarian troubles in the Highlands area is well

• 241 documented; and Harris and Lewis played out their part in the
614 agitation for more land. Briefly, when the clan system was broken
182 down, the clansman found himself freed of the obligation of ser-
311 vice to the chief. The chief, on his side, found himself thrown to
*175 the economic dogs. Payments in kind were no currency; a house in London or in Edinburgh had to be paid for in cash, and a London hairdresser would hardly accept half a dozen eggs for his services. The effect of the Heritable Jurisdictions Act was like a butcher's chopper. With a stroke a social organisation was given notice to change overnight, with no period of transition allowed. The chiefs looked to the land for their money. In the old system, their prosperity had been largely measured in fighting men. Now the pressures of economics demanded increased rents from those who were being called tenants. Increased rents can, however, be paid only when the land's productivity rises. The agricultural changes percolating through the Lowlands of Scotland had not
(427) even begun to penetrate to the Highlands area. Many tenants found that, unable to pay the increased rent demands, they were ejected from the lands which, incidentally, they had held by
(167) traditional understanding—written deeds were rare. Emigration
(233) started, and the vacant lands went to sheep-farmers, well able to pay good money for the grazings.

241 Some chiefs did give their tenants time to change to new
614 methods of land use, and were careful not to make a breach be-
311 tween agriculture and grazing. Their tenants in turn improved
427 the land, changing in particular from the old run-rig system,
*175 whereby a man working a piece of ground one year had the same piece the following year only if the dice were thrown his way. But the class of farmers' tenants called crofters (who had no security of tenure) or cottars (a squatter type with no legal recognition) found themselves on the verge of starvation. The few acres of ground they had, or to which they had been removed, were quite unsuitable for intensive cultivation to produce even the basic necessities of life.

*175 The picture of land use was that of a great black pot boiling
423 furiously with a brew of which the final taste was quite uncertain.
311 When the boiling was controlled, the land began to be parcelled
241 out, a share to each family. This led to a rigid, almost monolithic,

[TEXT CONTINUED ON PAGE 55]

agrarian order. Crofting townships were created which contained 175*
holdings of a uniform size, often fit to provide only a bare sub- 423
sistence living. This is still so today. There were and are no means 311
of achieving ambition through some kind of agricultural promotion, 241 •
no ladder to climb to prove one's ability to win the land over to (108)
one's side to increase its yield. And as each family increased, the progeny demanded land. The family acres were divided, subdivided and fragmented to a vicious mathematical system: more people, less land.

In the nineteenth century, many estates were sold. The new-
(427) comers, with no kinship ties with the small tenantry, saw that the only way to make their estates economic was to establish large farms, which meant the eviction, by force if necessary, of the small tenants. This is what happened. For those who did not 175*
emigrate, it was a life of huddling around a weak fire, whose flame 423
itself could hardly stand, and thinking of the prospect of starva- 268
tion and the 'old days'. Thoughts nourished on these old days 420
became the root of action; and a fierce agitation for land reform (511)
started. The Minutes of Evidence of the Napier Commission (1882-4), of the Deer Forest Commission (1894-6) and the several official reports on the conditions of the crofters and cottars, give ample evidence of bitterness and despair as the result of poverty and lack of opportunity. About 1870, unrest in the congested areas of crofting townships became a political issue. The flames of ideals were burning high and bright. Ideals were transformed into action: take the land!

By 1880, the ripples from the stone flung into the agrarian pond were reaching the general public. Sides were taken: one stood either on the economic touchline, or on that dangerous thin red line of sentiment based on high feelings and a deep sense of wrongs being perpetrated on fellow humans. The landowners naturally insisted on the right to move into an era of land use in which management was not hampered by affairs of sentiment or philanthropy. Governed by the cold principles of business, they hardened themselves in the face of their attackers. And though they pointed to arrears in rent, and their inability to improve their land agriculturally while they had tenants not of their own choosing, they faced mounting antagonism.

1901, the average was only 5·086, the county average being 3·983. 161
The population was still to reach its peak in Lewis, some 30,000, 162
in 1911. Emigration was at a fairly high rate, some 2,000 every 175*
decade, but this was no relief with births between 8,000 and (167)
9,000 during the same period. In 1894 it was estimated that the number of cottars (or squatters) as distinct from crofters was in the region of 1,000. These people, mostly relatives of crofters, constituted a serious incubus on every crofting township.

Elsewhere in the Highlands, the enlargement of crofting hold- 175*
ings relieved the land-hunger situation. It was not possible for 423
the same to be done in Lewis, and Harris possessed even less 241 •
useful land to share out. Many applications were made by crofters either for an increase in their own holdings or an increase in the acreage of common grazings held by each township. Though some 500 acres were in fact handed over by the estate management for crofting purposes, there was a steady refusal to diminish the acreage of farms.

The Congested Districts Board was appointed in 1897, super- 175*
vising public works to relieve the people of a certain amount of 657
their ills. It carried on until 1912, when it passed into the newly- 656
formed Board of Agriculture. The Congested Districts Board 423
could have achieved much more than it did. It scraped away 427
only a little of the vast problem. The next major landmark in the 241
history of crofting legislation was the Small Landholders (Scot- (363)
land) Act of 1911. It extended certain provisions introduced for the crofter in 1886, and further increased the class of tenants who benefited by bringing in the tenants of holdings rented at not more than £50 (£30 in Lewis) or not exceeding 50 acres (30 acres in Lewis). The 1911 Act also brought into existence the Scottish Land Court in place of the Crofters Commission. In Lewis, however, the hunger for more land went on unabated and reached a not insignificant peak during the later years of Lord Leverhulme's regime.

A new Crofters Commission was set up in 1955, following on the report of a Commission of Enquiry under the chairmanship of the then Principal T. M. Taylor of Aberdeen University. Fresh provision for the reorganisation, development and regulation of the crofting system in the seven crofting counties of Scotland

*175 was made in the Crofters (Scotland) Bill of 1961; this had a mixed
657 reception. In general, today, small crofts predominate in most
656 areas. Out of some 18,000 (the number is decreasing annually)
423 about 15 per cent exceed 20 acres (see Chapter 5). But size has
420 little to do with the type of land; whether arable or rough grazing.
• 24 In fact, the proportion indicates that some 85 per cent of all crofts
(178) in Scotland, and this applies to Harris and Lewis, cannot be considered as full-time now or as potentially full-time.

EDUCATION

*175 In general, the Highlands and Islands of Scotland owe their intro-
799 duction to letters to the early Christian missionaries. One of the
871 main provisions in the early monastic Church in Ireland and Scotland was for the cultivation of learning and the training of its members in sacred and profane literature. Associated as they were so closely with the common folk on the one hand and the aristocracy on the other, something of this learning and desire for learning rubbed off to advantage on to willing recipients. Literacy
(212) however, has had many ups and downs since the dawning of the Christian era in the Hebrides. Though it is impossible to ascertain to what extent the common folk participated in the knowledge imparted by the early Celtic monasteries, there are many references to a class of cleric called 'scolocs', whose learning was accessible to the poorer classes of the emergent Highland society. The 'scoloc' is still retained in Gaelic as 'sgalag', a farm servant, the poor searcher after knowledge who received education in the monasteries in return for services as labourer on the church lands, and who appears in monastic records as late as the fourteenth century.

*175 As late as the sixteenth century, however, after the influence of
212 the Church had diminished, the inhabitants were almost wholly illiterate. When the Fife Adventurers came to Lewis in 1598, they brought a schoolmaster with them; though it can be taken that his services were intended for the improvement of the incomers rather than the islesfolk. Old Roderic MacLeod, doughty chief of the MacLeods of Lewis at the time of the Fifers' arrival, was unable to sign his name. Two of his sons, on the other hand, were

5 AGRICULTURE AND FISHING

THE economic possibilities of the peat blanket of the island, particularly in Lewis, have attracted the attention of many would-be exploiters. Sir James Matheson's advisers formed the idea that the Lewis hags could be turned to a good profit, and Sir James's series of peat reclamation and improvement programmes are still echoed today. He first cast his eye to the west, north of Achmore, a township set up more than a century ago on deep peat. The peat reclaimer he employed was none other than Alexander Smith, one of the best-known 'speculative' agriculturalists in Scotland at the time. Smith had already transformed the Carse of Gowrie from bog to a fertile tract of land; could he not do the same in Lewis? The site chosen was seven miles from Stornoway and the little hamlet established there was called Little Deanston, in recognition of Deanston, Perthshire, to which Smith belonged. The soil consisted of bog-moss, varying in depth from 3 to 8 ft. Sixty acres were wedge-drained and laid out in fields of ten acres enclosed with ditches and turf fences. Ploughing and trenching began and fertilizing agents were applied, including clay marl, shell sand, guano and dissolved bones. Two of the fields were put through a course of arable cultivation, the others being laid down in grass. After the fields had been worked for a few years it was found that the driest ground gave the best results. In time the land was handed over to some crofters from nearby Lochganvich, but in 1850 it was abandoned because of the difficulty in getting seaweed for manuring; and besides it was not possible to keep the land in good heart and to do fishing as well. The tract of land concerned today still shows a better quality of pasture than the adjacent natural moorland.

Smith gave his impressions voice in 1844, just after his first visit to Lewis, to the august members of the Glasgow Philosophical Society. The cultivation of the soil was as primitive as the

islanders' manufacture of cloth. The inhabitants were at least a century behind the times, though they were, he found, in no way deficient by nature. They were social in their own style, and they had very good heads, 'that is, for people not accustomed to habits of thought'. So far as agriculture was concerned, nothing in the way of draining the land had ever been accomplished; nor had any effort been made to penetrate the hard sub-soil. He held that the great scarcity of timber had been a serious handicap when it came to agricultural implements—to their renewal, repair or possible improvement. Under direction, however, he was convinced that improvements in land use would result in considerable benefits to the island. He added that he hoped the period of this improvement would not be far off and that visitors would find 'a green, pastoral land instead of a dreary waste'.

Yet not until 1928 was peat reclamation and development again brought out for an airing. This time, the benefactor was the late Mr T. B. MacAulay, a Montreal magnate, a son of Lewis connections. He gave £10,000 to establish an experimental farm in Lewis, and a site on Arnish moor, not far from Stornoway, was chosen. It was typical of most of Lewis: black, water-holding peat, which when squeezed, instead of allowing water to escape from it like a sponge, oozes itself through the fingers. The aims of the farm were to provide additional arable land on which to grow winter fodder, and to improve, at as low a cost as possible, the grazing on the moorland. Fifty acres were certainly converted from moorland to arable, and this formed a basis for an experimental extension to another 100 acres. By 1936 the farm had a sales income from produce of about £1,400. The stock in that year included 40 head of thriving cattle, including 15 dairy cows, 20 poultry, 140 blackfaced sheep, and some fattening pigs. The sheep were a late addition, made with the dual aim of pasturing on moorland too deep and soft for cattle in wet weather, and of improving the sheep strain of the island.

By 1938, it had been shown that some lasting improvement on moorland of reasonably favourable slope could be effected at a materials cost of about £3 per acre, and without heavy labour costs. Thus, the common grazings held by the crofting townships could be improved, if a co-operative effort were organized. So

far as the reclamation of arable land from moorland was concerned, however, requiring as it did under-draining and cultivation, the labour costs were heavy, approaching the £20 per acre mark including the liming and fertilizing.

Though the farm was used for dairying with some reasonable results, the moorland acres put into good heart at Arnish were left to deteriorate. The run-down of the experiment followed the depression of 1933. Funds dried up, and in 1939 the farm was let to a tenant. But the lesson obtained from the MacAulay farm was a good one. By simply dressing with shell sand, of which large quantities are available on the shore-lands, applying some form of phosphate and seeding with cheap clover or ryegrass—involving no cultivation—large areas of moorland can be persuaded to do a good job. The work at present being undertaken by crofters to improve moorland grazing is worth mention. Areas of land have been given a surface application of approved compound fertilizers, phosphates, lime or shell sand, and selected grass-seed mixtures. The results are literally a sight for sore eyes, and bring Alexander Smith's 'green, pastoral land' close to realisation. Although individual crofters have taken advantage of the help given to regenerate rough grazings, the most spectacular results have been seen on the township common grazings; most of these have been fenced off and improved. Today, something like 14,000 acres of lush green pastures are steadily spreading over deep peat where formerly grew only sedges and brown heather.

To end this aspect of land use in Lewis on a historical note, the story of re-seeding had its beginnings during the time of the Napoleonic Wars. A minister who had some land at Barvas, on the west coast of the island, decided to attempt the reclamation of useless heather-bound and bracken-choked land. He sanded the area with shell sand, seeded it with a good strain of grass and used sheep to tamp in the seed. One can imagine what Lewis would be like today if the Barvas minister's work had been followed up by Alexander Smith and those who set up the farm at Arnish.

THE CROFTER

The pursuit of agricultural processes, their growth, development and improvement, to establish a foundation for a secure society has never been easy on the island. The unyielding nature of the base rock, Archaean gneiss, its hardness, its non-porous property, have all contributed to the resultant pattern and character of society which emerged. Though one is tempted to define crofting as an agricultural activity, it is also something much more intangible: a way of life. To quote the Napier Report on *The condition of the crofters and cottars in the Highlands and Islands of Scotland* (1884): 'Habit and local affection bear so great a sway in the actions of mankind, that Highlanders will be found who would rather be proprietors in the mountains of Skye, or the wastes of Lewis, than on the fertile plains of Manitoba.' 'There is the Island of Lewis, with poor, peaty soil covering the Archaean gneiss, but with a crowded, lively, vivid community,' said the Taylor commision in 1955 (Commission of Inquiry into Crofting Holdings).

The Highland crofter is the subject of an extensive literature. A special authority, the Crofters Commission, exists solely for the purpose of caring for his needs. He has special rights and privileges which are safeguarded by the Land Court. Crofters' unions have formed themselves into a strong federated wall for the system's defence.

Socially, the term 'crofter' means, on the island at any rate, a landholder who cultivates his own (arable) holding, his croft. He shares the common pastures with his fellow-crofters, each of whom has a right to carry a sum of so much stock, the 'souming'. These common pastures or grazings are a social link of some considerable significance, forming the basis for the crofting township, as distinct from the communities set up under the influence of some agricultural land use such as hamlet or village, where there are both small-holders and true farms, and the only communal land is the village green or common. For instance, outside the crofting counties area the main unit of Scots life in the country is the farm, with its tied cottages. Then come the full-time small-holdings important in the north-east and the southern Highlands.

EARLY AGRICULTURE

In the past the land was worked with reasonable efficiency, at least to produce a subsistence economy. The reports of various observers on the islander point to this. But they also record a slow deterioration in the use of land with an agricultural element, as distinct from crofting. First, to Donald Monro, Dean of the Isles. His account of the Western Isles (*c* 1549) indicates that the population was very much greater then than now, and methods of agriculture were not far behind those used on the mainland. In addition to the raising of cattle, cereal crops were grown. Harris was 'very fertile and fruitfull of corne store and fisching, twisse mair of delving in it nor of teilling'. Lewis was 'faire and waill inhabit at the coste, ane fertile fruitfull countrey, for the most part all beire [barley] . . . in this ile ther are many shiep, for it is verey guid for the same.' Taransay (on the west of Harris) is reported as 'ane rough ile with certain tounes weil inhabit and manurit; but all this fertill is delved with spaides excepting as meikell as ane horse pleuch will teill and zet they have maist abundance of beir, meile of corne, store and fishing.' One must, however, regard the Dean's account in the light of his mission, which was to visit the Hebrides in a pastoral capacity. His concern was thus chiefly with Church lands which, agriculturally speaking, were the best. There is evidence also that the clergy in the islands were as good farmers as they were theologians and, as elsewhere, stimulated agriculture by example and precept.

The next reporter was Captain Dymes, sent from London *c* 1630, to report on the islanders, their agriculture and their ways of fishing. He confirms much of what the Dean said, even though one suspects that a pinch or two of adjectival seasoning has been added, for was not King Charles interested in Lewis and its resources? Again Lewis is described as 'very profitable and fertile alswell of corns as all kinds of bestiall wild fowl and fishes and specialie of beir sua that thair will grow commonlie 20, 18 or at leist 16 bolls beir yeirlie after ilk bolls sawing'. Harris was 'fertile, commodious and profitable in all sorts'.

About half a century later (*c* 1695) Martin Martin paints a different picture. Agriculture is in a shameful state of neglect and

A HARRIS VIGNETTE

Other tombs inside the church include that of Mary MacLeod, a bardess of the seventeenth century who was also governess to the young MacLeods at Dunvegan. She was probably the first to compose what may be called the 'court' song, in simple words and in the 'strophic' verse-form of rhythm and assonance enjoyed by all Gaels since her time. Her last elegy was composed to Sir Norman MacLeod of Berneray in 1705.

So far as personal characteristics are concerned, there is a marked difference between the Herrach (Harrisman) and the Leodhasach (Lewisman). Their Gaelic dialects are different, the Harris pronunciation being much softer, with an attractive singing lilt. And Harris Gaelic has fewer words of Norse origin. The main reason for this difference has been a topographical one: before a road was cut, the mountain barrier of north Harris divided the inhabitants of the two parts of the same island, who developed in their own distinctive ways.

The character of the land of Harris has also had much to do with the difference. Harris for the most part is infertile, with great expanses of rock outcrops. The east side of the island is torn in shreds by fiord-like sea-mouths; the west coast is slow-moving, with large expanses of sand and machar-land which look out over the Atlantic breakers rolling in from a sea that is oceanic in appearance and in fact. From early times the Harris folk have had to work hard to scarify their snippets of land to make it fertile. Regular increases in population forced them to cultivate land extending up to 500 feet above sea level in some places, in the form of hard-won lazy-beds. After the clearances early last century, when the more fertile lands on the west coast were taken over for the formation of sheep farms, the people concentrated on the eastern side of the island, and on some of the higher ground in the west.

On Lord Leverhulme's death in 1925 the ownership of large tracts of Harris passed to absentee landlords. After this, some of the lands which had been cleared a century earlier were purchased by the Government and broken up into crofts again, enabling some of the indigenous population to come back to make use of the more fertile lands of the west. There are some 550 crofts in Harris, with 29 regulated common grazings; the total

A HARRIS VIGNETTE

acreage of regulated common grazings amounts to 65,000 acres. The working units (as distinct from crofts) in Harris are classified according to the arable acreage; the majority have up to 10 acres arable land. Less than 250 acres of land have been improved.

The age stucture of the Harris population in 1931 and 1961, showing th decline in numbers and rise in age

There are four districts in Harris: North Harris, with it islands; the Bays of Harris on the east coast; the Leverburgl area, with the islands of the Sound of Harris; and the west coast North Harris is mountainous country, dominated by the Clishan

A HARRIS VIGNETTE

621 has direct or indirect communication with Glasgow, Stornoway
631 and North Uist. In summer a thrice-daily bus runs to Stornoway,
[505] and once a day a bus makes the round trip of East and West
[494] Harris. The township, linear in pattern, east to west, includes six-
[361] teen shops which cater for most of the needs of the population
[366] within reasonable travelling distance; it also has two cafés, a
[368] post office, a licensed hotel, a hall for social functions, a
[873] masonic hall and two churches. The Sir E. Scott School here is the only secondary school in Harris with an academic stream. Most of the working population is employed in the service industries, the professions and the tweed industry. Tarbert was a
[504] fishing port of some significance in the past, and is now a refuelling point for ships.

464 The absence of organised industry on a large scale, such as
[167] Lewis has, is a factor which tends to bring nearer to reality any desire on the part of Harris natives to leave their native soil. There are small pockets of industry, but these are only dabs of easing
463 ointment on the excessive unemployment sore of 27 per cent. The
[241] main occupation is of course crofting, the income from it being
[434] augmented from a variety of sources. Some crofters concentrate on the production of Harris Tweed, perhaps using the wool from
[286] their own sheep; the natural dyes from the lichens which grow
[386] on the rocks and from other plants are still used occasionally. Others specialise in knitwear. Recently shell-craft and wood-turning have been added to the traditional crafts, with a view to the
[226] tourist market. Fishing, of course, plays a part in the economy in some communities. The interest of such organisations as the Scottish Country Industries Development Trust has been concentrated on the potential in shell-fish processing, and the production of knitwear on a larger scale than exists at present. Road-
[464] work gives employment to about thirty men, but is of course seasonal.

316 An apparently bright light on the employment horizon showed itself in 1965, with the opening of a quarry at Lingerbay. The mineral quarried was anorthosite, a white granite used as an abrasive in cleaning products. A 99-year lease was taken out by a subsidiary company of William Robertson (Shipowners) Limited, Glasgow. But the quarry was closed in 1967 due to lack of orders.

A HARRIS VIGNETTE

HARRIS'S OFFSHORE ISLANDS

Scarp

361 Until 1972 Scarp was the most westerly inhabited island in Scotland, separated from the Harris mainland by a strait which is about half a mile across at its narrowest, coursed by strong
[133] tidal currents. The island is about three miles in diameter, rugged, especially in the north and west, with cliffs on all sides; the maximum altitude is nearly 1,000 ft. On the east side lies a
361 tiny marginal belt of good land, machar and soil; on this green
311 shelf, about one-third of a mile long, were all the crofts of the
[134] Scarp settlement. Many stand deserted, and abandoned lazy-beds
[241] in sites beyond the present settlement indicate a denser population at one time. The island's population-carrying capacity was severely limited by the minute amount of land available for tillage: of a total of about seven square miles only half a square mile can be used. Climatic conditions and soil type also restrict the range and quality of crops grown.

*175 Scarp was originally settled about 1810 and was occupied by
361 eight farming families who were reasonably comfortable. Not only did they have the island to themselves, but they had access to good pasturage on the Harris mainland opposite. About 1823
[166] thirteen small townships between the head of Loch Resort, Harris, and Bunabhainneader were cleared, some of the displaced families coming to Scarp. Some emigration back to Harris took place in the 1840s, but when about 1868 the proprietor divided Scarp into sixteen crofts instead of the previous eight holdings, these were further divided by the people themselves, trying to accommodate
[162] their families and friends from elsewhere. In 1861 the population was 151; the peak was reached in 1881 with 213 persons. In 1951 it was 74. Communication with the Harris mainland is by boat, plying between two stone-built jetties.

433 The local economy was essentially a subsistence one, with self-
241 sufficiency in such products as potatoes, turnips, cabbages, oats,
234 milk and fish. After a break of some years lobster-fishing has
226 recently been reinstated as an occupation. Oil lamps are the only lighting, though a few houses have piped water. The small shop
354
336
000

verses would ring false to them! Before 1939, two-fifths of the rural pupils of most non-crofting counties came or went in the school year—most of them the children of farm servants. Their schooling suffered, and their teachers might be reduced to despair; indeed it is to educationists, rather than to agriculturists, that we owe a survey of these facts. When they leave home to be 'hired', the young folk learn to fend for themselves but may suffer in the learning: stability of character and endurance in attachment are hard to form.

It would be difficult to overstress the tragedy of the long-continued break-up of rural communities in the Lowlands. From the later years of the English invasions, as when Major wrote with his knowledge of Scotland in 1500, this break-up continued through the early, largely unrecorded phases of the agricultural revolution, down to the later phases from 1750 or 1800 to the present day. No one who has worked with fellow-servants on Scots farms will under-estimate their sterling qualities. But the break-up, the tragedy, happened. It was boldly sketched by the Rt. Hon. Thomas Johnston (to 1929) and verified by Miss I. F. Grant (1924 onward). Beginning from intimate study of well recorded and surviving ways in the Highlands and the Hebrides, Miss Grant realised the significance of earlier Lowland life in the farm-hamlet or ferm-toun, as Lowlanders themselves could hardly have done. Comprehension of this break-up of community brings out the value of the enduring elements of communal life still recorded, remembered and surviving in the 'Outermost' Hebrides, at the core of 'the North and West'.[1]

[1] Ideas outlined in this section are developed in A. Geddes (1938–54). Detailed references will be found in the Bibliography.

follows that as the descendants of the crofters of the South-west and East Highlands could and did change their ways within the space of a lifetime, so those of the North-west Highlands and the Isles can change too. Given the co-operative leadership which is arising in the twentieth century and was totally lacking in the ideals and training typical of the nineteenth, that change may be not only for the better in the development of 'individual' qualities, such as the power to do hard work for 'success'; change may also maintain and develop what still remains of the old characteristics which gave the community life of the Gael, with all its faults, elements of beauty and sanctity.

In an article on "The Human Geography of Lewis", A. Stevens (1925) described the Island and people. His comparison of the cold, wet 'desert' of Lewis and its corn-patch 'oases' with the desert of heat and drought and its oases of palms, is ingenious and suggestive. One might follow up the analogy and compare irrigation to the drainage of moorland and its fertilisation, which form the means of reclamation at home, and draw parallels between their immediate results on the land and the ultimate effects on work and social life.

Until the agricultural revolution, the unwritten story of Scotland was in great part that of a long, uneven struggle to make sour soils fit for cultivation and productive of a livelihood. Most of all is this true for North-west Scotland; moreover, there, for eighty years past, the struggle has been a losing one, in the sense that arable land has been decreasing and rough pasture deteriorating. In spite of subsidies, the 'marginal farms' of Scotland have a tough fight. Yet lands from Scandinavia to Finland and North Germany are giving a lead in peat-reclamation, where

Scotland had begun to lag since her pioneering effort from 1750 to 1880.

Fortunately, Scotland is now recognising that in peat reclamation, on the one hand, and the improvement of rough grazing, or at least its maintenance, on the other, there lies a problem of national importance. More than half the land surface of the country consists of mountain and heath land used for grazing, not including 'deer forests' from which sheep had been altogether excluded. The arable land of Scotland is less than one-sixth of the whole, with about one-twelfth in addition under permanent grass. Moreover, since most of the enclosed land is distant from the area of rough grazing, the latter is partly wasted. The difficulties of soil and sea and of the whole economic situation are great, and must be understood.

(B) THE ISLAND LANDSCAPE, LAND-FORMS AND GEOLOGY

1. *Aspects of the Isle*

Lewis-and-Harris, the most northerly isle of the Outer Hebrides, and the largest, is roughly lozenge-shaped. Although only thirty miles in width, it is over sixty miles in length. Attached to Harris parish is the little isle of Berneray, half a dozen miles farther south. It puzzles the stranger that, while the archipelago of the Outer Hebrides is best known to the inhabitants as "The Long Island", Lewis (or the Lews) and Harris, which actually form one island, are spoken of as separate islands.[1] Yet nothing could be more natural. Before the making of

[1] "The Long Island", Gaelic *An Eilean Fada*, as a name for the Outer Hebrides has the sanction of traditional usage, as Alexander Carmichael noted in his Introduction to *Carmina Gadelica* (vol. i, 1900; and 1928).

Except for the sandy bays hidden beyond the headlands, or the long machar of west South Harris, the coast of the Island at high tide rises straight from the undermining breakers, rugged and uncompromising. A series of sandy 'storm-beaches' links the lower promontories, but the series of raised beaches found on the mainland and the inner isles seem absent round the Island. Along the western mainland and the Inner Hebrides, a secret harmony links the lines of the sea with those of the land, even on their wildest coasts of gneiss. Above the level plane of the sea, the shores of the mainland rise in rhythmic curves, tier above tier, some 10, 25, 50 and 100 feet, above the present line of waves and the triple band of colour which marks the shore at ebb-tide, formed of golden tangle, grey barnacles and pitch-black rock. These tiers are the 'raised beaches' of a coast which has emerged, by stages, to some 100 feet above the sea.

Lacking the raised beaches of an emerged coast, the Outer Hebrides show no clean-cut terraces like those of the mainland, inviting little communities to lay out their homesteads in an orderly way. For this reason, the older, unplanned crofts spot the landscape in an irregular way which is sometimes picturesque, yet often almost uncouth. The raised beaches have given the Gaels living east of the Minch a few precious acres of passable ploughland which would otherwise be lacking. In the Outer Isles compensation is found on the smooth machars of shell sand. These machars lie mostly on the stormy Atlantic shore, so that the more cultivable fringes of the Outer Hebrides turn their back to the mainland—except round Stornoway, a reason for their isolation.

In detail, the coasts may be grouped in three types: (1) sloping to the sea, by the sides of sheltered lochs

121 From prehistory to the present day, these geographic
178 zones have played their parts as factors in evolution,
although the border-lines have changed at different historic
174 crises, and have been modified by economic and social
182 phase. At times the Hebrides have been more closely
linked to Ulster or to Norway than to Central Scotland.
184 In viewing these zones, we shall not find simultaneity in
historic events, but comparability in stage and transition,
even at differing periods. From the evolutionary point of
view, the revealing character of Island life lies not only in
static survivals, in what Sir Arthur Mitchell found in the
Isles and vividly described as " the Past in the Present ".
Island life is characterised still more by the dynamic
strength of its continuity—notably of early or primitive
Christianity—and also by the late occurrence of changes
when, at last, they came.

18 The social consequences of these regional differences
62 in evolution are profound. In the ' Plain ', to the south-
174 east of the Severn-Tees line, large village communities
with ' common fields ' prevailed, forming the later manor
423 villages. To the north and west, the more varied, hillier
192 lands encouraged the continuance of hamlets. These
hamlets housed close-knit groups of families, often of no
more than four or five to a dozen relations or ' friends '—
—in Scots even today (much as in Gaelic) the word
462 ' friend ' frequently implies kinship. Each small group
476 formed a team. Together the men ploughed their mingled
241 rigs (or ridges) and herded their stock in common, and
286 on the coast they rowed their boat as its crew. The
423 women, too, did much together, as when they spun their
yarn, and fulled or ' waulked ' the cloth that one of them
had woven, helping by turn in childbirth and child-care.
Usually several of these teams were linked in a larger

18 pastoral group, the germ (in the Hebrides) of the present
621 township with its common grazing. Hamlets and town-
174 ship formed circles of cultural and religious life in common.
[423] These ' sociable hamlets ', or ' little commonwealths ', as
they were called by understanding writers on the High-
lands, lived on in the Hebrides almost until a century ago.
Features of their form and life have long been known, but
their life has not yet been envisaged in its full dynamic
significance.

127 The homesteads, informally grouped in these small
36 hamlets, have been mistakenly described as solitary or
174 ' dispersed ' by scholars accustomed to larger and more
compact grouping. The mistake was made by geographers
[423] of the nineteenth century, such as Meitzen with reference
to the hamlets of Brittany. Similarly, because of the
[476] small number composing a typical joint team, the vital
fact of team-work and joint holding has frequently been
overlooked ; yet a fundamental mistake is made when such
close-knit team-work and joint tenure are described as
174 ' individualistic '. Moreover, these teams were linked to-
621 gether in larger, more loosely bound pastoral communities
63 of township and district. In Scotland and elsewhere, it is
true, such hamlets came historically to be split up in various
• [241] ways, into smaller farms and scattered cottages. The
larger link of common life was also superseded by the
[178] proprietor's estate. Indeed, the twofold revolution in-
volved caused a fundamental regional cleavage within ' the
North and West '.

[182] Partly as a result of their small size, the tenure of farm-
hamlets was frequently informal. In northern England,
[184] the hamlets and their lands were not entered in Domesday
Book ; still less are early entries complete in Scotland.
[178] For this and other reasons, jurist and historian may fail

184 share their characteristics. So to gain a sense of pro-
105 portion from the start, we must map the location of Scots
countrymen, their numerical importance, and their types
[128] of grouping. Let us begin with the first of these three
[102] aspects, their regional location (Fig. 2).

The base map on which the data are plotted shows the
boundaries dividing the hill masses of the Highlands and
102 Southern Uplands from true ' lowland '. This hill country
13 is mostly covered by rough pasture (left blank on the map)
311 within which lie strips of ' Isolated Arable ' with other
improved land in the valleys and along the outlying coast-
lands (shown in black). This hill country includes the
Scottish Isles, with the exception of Orkney, which falls
• [241] rather into the category of ' lowland '. It is largely devoted
to sheep farming and crofting, or left to grouse and deer.
[429] The lowland area from the Orkneys to the Tweed and Sol-
way is devoted to mixed and dairy farming with lowland
types of small-holding, except, of course, for ' Industrial
Regions ', which include most of the urban area of Scotland.

[226] Within the ' three-mile ' territorial limit from the coast
lie the inshore waters, in which local fishing was once
important, and might again become so ; these are left
white on the map (Fig. 2). By contrast to their narrow
extent on the East Coast, their width is notable in the
Northern Isles and on the West Coast.

102 The problem set in making this map is to show two
13 different worlds, as it were : the Highland and the Lowland.
184 The two are rarely envisaged together, and much confusion
of thought and policy results. To master the map, the
128 reader may scrutinise first one part, the Highlands (cover-
ing the other with one hand), then the other part, the
182 Lowlands (in the same way) : thus each will appear clearly
in turn. Both can then be envisaged together.

FIG. 2.—Map to show (i) the use of land and sea in and around Scotland, with special reference to the Crofting Townships Zone of the NW. Highlands and Isles, and (ii) the average size in each county of labour-teams of farms and small-holdings in the Lowlands

182 Let us begin with the economic and the social signi-
184 ficance of the Highlands and Isles with which we are
concerned. Economically the crofters' 'living space' is
311 the narrow interrupted belt of improved land (shown black)
(241) which is generally fronted by the sea and its inshore waters,
(427) and is backed by the Crofters' Grazings (enclosed by line
C on the map). Some 700 crofting townships or com-
(361) munities are found in Zetland, the North-west mainland
and the Western Isles, each with its Common Grazing;
the line C also encloses a small area devoted to other
grazings. Deer forests predominate on the eastern, main-
land, side of the line. On the remainder of the hill country
are to be found the hill-sheep farms, with other small farms
and small-holdings.

174 In the past the fishing crew at sea and the joint labour-
621 team on land formed the communal units contained within

(241)
(361)

226 the township; and to each were allotted the rights of the
common grazing and the fishing grounds. For more than
• 241 a century the croft has been held individually, though in
423 the townships the common grazing is still held in common.
621 Beyond these 'homely' limits lie wider horizons, in the
past those of seafaring and of droving or the chase, and
632 today of fishing and gillieing at home, or of ocean journeys,
(178) urban occupations or colonisation.

In the Lowland regions each symbol represents 100
182 holdings. For (A), 'mixed and dairy farming', the par-
184 ticular type of symbol shows the average number of workers
241 employed on a farm-holding in each county. On each
farm the employed workers form what may be called the
'Labour-Team'. A team may be 'small', 'medium' or
'large'. The Scottish averages of these three types (indi-
cated in the inset key to the map) are roughly three, five
and seven workers per team. Four 'casual' workers are
counted as equivalent to one 'permanent' worker, but
farmers' wives are excluded. Under (B), for the same
Lowland counties and areas, full-time small-holdings are
(543) shown separately. The Scottish average of less than one
full-time worker employed, most often a son or daughter
of the small-holder, is typical of all the counties.

241 As to the relative importance of the different classes of
farms and small-holdings in Scotland, true agricultural
(162) land-holders number 68,000, of which fully one-third hold
part-time holdings (like the Island crofters), one-third
'full-time farms', and rather fewer (one-fifth) hold 'full-
time small-holdings'. The remainder accounts for other
types of less importance. The farms predominate in terms
of improved land, full-time employment, and of course of
(311) production. As to area, farms cover 80 per cent of agri-
(464) cultural land. The farmers employ nearly 90,000 workers,
(162) [refer to map p. 16 -- analyst]

• 241 and with the addition of 10,000 workers on full-time small-
162 holdings, these constitute a labour force of nearly 100,000.
464 Nevertheless, there are more crofts than farms in Scotland,
and more small (part-time) crofters than farmers, besides
241 'full-time small-holders', of whom so many are crofters,
north of the Highland line. Thus the number of crofter
427 families forms an important item of Scotland's rural popu-
162 lation. Of these, the families of Lewis-and-Harris form
fully one-fifth, owing to the remarkable growth of popula-
tion until 1925. Even in the little burgh of Stornoway
many families hold a plot of land, and at heart they may
be almost as much 'crofters' as townsmen.

241 Socially, what is meant in the Island by the term
427 'crofters'? Although each Island crofter cultivates his
own arable holding (his croft), he shares the common
621 pastures with fellow-crofters, each having a right to a
'sum' of so much stock, 'his souming'. Open, sandy
land by the shore, if any, may also be shared. These
common grazings, shared together by the crofters of one
community—a hamlet, a village or township—form a social
link of great significance. They distinguish what we shall
call 'township crofting' from individual holding, whether
of part-time or full-time small-holdings, or of true farms.
The common grazings, enclosed by line C (Fig. 2), thus
(361) form an important social index. About 75 per cent of the
area included forms Common (or other Crofters') Grazings.
The close dots of the dotted line divide the 'Commons'
from Deer Forests, as in the Island and inland from the
north-western coasts. Widely spaced dots divide the
Commons from the Sheep Farms and other mixed holdings
further south.

241 Outside the tract of 'township crofting' in the north
361 and west, the chief unit of Scots rural life is the farm,
[see p. 16 -- analyst]

• 241 with its tied cottages and frequently a 'bothy' for the un-
362 married. Next to this comes the full-time small-holding,
important in the North-east and the Southern Highlands
(184) of Scotland. Great as are the differences between these
types of unit today, they go back, to a considerable extent,
(174) to common origins. The sites of the farms are ancient.
And their people, though since divided into masters and men,
are the successors to those who were once the 'kindly co-
operators' of older 'farm groups', of Lowland *ferm-toun* and
(184) Gaelic *baile* (pronounced like 'ballie'). The island counter-
part of these, and their life, will be described in Part Two.
Hence, before we turn to further analysis of the Highlands
and Isles, a word more should be said of Lowland types.

241 An important social index in the Lowlands of Scotland
is the number composing the farm labour-team, averaged
361 for each county. Villages and even hamlets are few,
464 largely because farmers and farm servants live on the farms.
Compared to those of most of England, Scots labour-
(171) teams are small. Yet, as the map indicates, there is a
(184) wide range from the 'large' teams of South-east Scotland,
through the 'medium' teams of adjacent areas, to the
'small' teams of the West and North-east. Not only do
the contacts of employer with employees partly depend
upon the number in the team, but so do the farm servants'
relations to one another. On the whole, the larger the
team, the more formal its organisation; and the smaller
(554) the team, the greater a worker's own responsibility. The
(178) 'family farmer' of the West and North-east is often an
ex-farm servant. From Burns's time, his character and
enterprise have been recognised in Scotland, and in the
last forty years have become well known in South-east
England. But the isolation of these little farms brought
its problems and its hardships.

[see map p. 16 -- analyst]

vision of adequate educational facilities in remote spots becomes increasingly difficult.

In its time Scarp has contributed more per head of population to the professions than has any other community of similar size. The last of the native Scarp population left the island in November 1971 : two families totalling seven people. The island has now attracted the attentions of a hippie community.

Scalpay

Scalpay Island, on the east side of Harris, was formerly occupied by two or three tacksmen in succession before being 'crofted out'. About 1843 the Harris factor settled twenty crofting families who managed to make a fair living there, but five years later another twenty families were added; some had been evicted from the island of Pabbay in the Sound of Harris. This led to some subdivision of the available land. The 1861 population was 388, but the figure rose to a peak of 624 in 1921; in 1951 it had declined to 541. It is now in the region of 450.

Island Scalpay is in fact one of the few places in the Highlands and Islands area in which the normal trends associated with remote regions are operating in reverse. The island despite its smallness—it is a mere 3 miles long and 1½ miles across—supports a thriving and dynamic community and is the envy of its neighbours. Scalpay is retaining its young folk; and it boasts some of the finest homes in the Hebrides. From the agricultural point of view it is not greatly different from other islands in the Hebrides. Its forty crofts produce a good crop of oats; but less than 20 acres of the land are re-seeded.

The land being as poor as it is, the men of Scalpay have turned their faces to the sea—for a living, not for emigration. Scalpay has the largest number of full-time fishermen and a total of thirty-three boats, twelve of which are ringnetters of over 40 ft. Native enterprise is also shown in the ship-owning firm whose vessels carry freight and passengers to many parts of Scotland and on occasion to the Continent. A Harbour Association was formed on the island in 1966 to work for local amenities for fishermen and

ugh the island is but a great lump of rock, Dean Monro says 175*
in his time an abundance of corn was grown, by delving 241
, and an abundance of clover-grass for sheep. The island also 231
luced a fine bere-meal which the islanders stuffed into the [427]
s of sheep and sent, as their rent or tribute, to MacLeod of
vis, along with mutton and fowls.

Of St Ronan's Chapel, still to be seen and reckoned the oldest 181
istian building in Britain remaining in its original state, 175*
nro says: 'As the ancients of the country allege, they leave a [346]
de and a shuil [shovel] when any man dies, and upon the [764]
rrow find the place of the grave marked with a spade, as they
ge.' In 1695 Martin wrote of Rona in 1680:

> The people repeat the Lord's Prayer, Creed, and the Ten Com- [788]
> mandments in the Chapel every Sunday morning. They have [794]
> cows, sheep, barley, oats, and live a harmless life, being perfectly
> ignorant of most of those vices that abound in the world. They
> know nothing of money or gold, having no occasion for either;
> they neither sell nor buy, but only barter for such little things as
> they want; they covet no wealth, being fully content and satisfied
> with food and raiment; though at the same time they are very
> precise in the matter of property among themselves; for none of
> them will by any means allow his neighbour to fish within his
> property . . . They concern not themselves about the rest of man-
> kind except the inhabitants in the north part of Lewis. They take [551]
> their surname from the colour of the sky, rainbow, and clouds. [62]
> There are only five families in this small island, and every tenant
> has his dwelling-house, a barn, a house where their best effects [342]
> are preserved, a house for their cattle, and a porch on each side
> to keep off the rain or snow. Their houses are built with stone and
> thatched with straw . . . When any one of them comes to Lewis,
> which is seldom, they are astonished to see so many people.

Then came tragedy. Somehow, probably off a wreck, a swarm 175*
of rats landed on the island and consumed virtually all the food. 731
A few months later, some seamen landed and robbed the islanders [165]
of their only bull. 'These misfortunes and the want of supply
from Lewis for the space of a year occasioned the death of all [166]
that ancient race of people.' Some years afterwards a new colony 175*
was sent to the island. In 1796, at the time of the *Old Statistical* 162

LIFE TODAY

As in other Highland areas, some of the island's problems have become so deeply entrenched as to be intractable. They have been the *raison d'être* of so many commissions and committees of inquiry that their existence is now almost forgotten by the islander —if indeed he ever understood their nature. Some results have been seen, such as the Crofters Act of 1886 which gave Highland crofters security of tenure, perhaps the most valuable measure of the last century or two. But somehow all things have not progressed so well since that date; at any rate not so fast that crofting, for instance, is now seen to be an economic form of land use of benefit to both local community and nation at large. Many problems have been virtually ignored by successive central Governments; at least, remoteness seems to qualify a topic for the office 'pending' tray. It has yet to be fully realised that the island, with other Highland communities, is part and parcel of the area generally administered from London and Edinburgh, and merits as much attention to its welfare as other European governments, such as Norway, give to their remote mainland and island communities.

As usual, charity and self-help begin at home, and one of the most dramatic changes in island life has been the result of the agricultural revolution of recent years which is changing once-brown moors to lush green pastures: reclamation by re-seeding. This revolution is still going on. Lewis crofters in particular are showing the way, with other Highland crofting areas following suit. The change in the Lewis scene is being emphasised by the planting of shelter-belts of hardy trees and the first of the new plantations of timber-producing trees. These show the promise of the future: a lively future for a lively community. The fishing industry also has a future, brighter on the horizon than it has been for many a poor year. The Harris Tweed industry, the staple employment-source in Lewis, is maintaining its ability to retain the interest of the market. And tourism, once a perfunctory and casual affair, promises to emerge as a useful sector in the economy. There are, in addition, many small pockets of native initiative and enterprise which, given sufficient encouragement

Two sayings sum up the lag of the seasons in the Wes and its effect on crops. The first runs, " Winter come not till after New Year, nor Spring till after St. Patrick' Day " (*Cha tig Geamhradh gu cul Calluinn, no Earrach g cul Fheill Paruig*). St. Patrick's Day is the 17th of March but old-style reckoning put both dates later still. Th other runs, " A frosty winter, a misty spring, a chequere summer, and a bright, sunny autumn, never left dearth i Scotland " (*Geamhradh reodhtanach, Earrach ceothanach Samhradh breac riabhach, us Foghar geal grianach, ch d'fhag gort riamh an Alba*). The retort is that thoug western summers may often be chequered with sun an showers well suited for growing grass and grain, th autumns are not really sunny, but rainy. Hence ' dearth —of grain—must result from spoiled harvests. Not so fo grass, unharmed by a wet autumn. Hay, if ensilage is no possible, can usually be gathered unharmed in sunny spell of summer if cut in good time. Agriculturally, the climat favours ' grass ' rather than grain.

Plentiful rainfall and coolness throughout the year d not allow of complete neutral decomposition of vegetabl matter in the presence of air. Hence, year by year, residuum of acid humus accumulates as peat on the ill drained surface. Prehistorically, more favourable phase of climate permitted the growth of pines. Knowledge o present temperature and rainfall alone would suggest th growth of broad-leaved deciduous trees, but these ar absent except in the sheltered policies of Stornoway Castle About 1695 Martin noted ' hazel and birch ' occurring o the south side of Loch Stornoway, but nowhere else on th Island. Even there trees are stunted as if pruned by th wind.

The further inhibitive influence is indeed the win

The historical aspect of these regional facts is extremely significant to the evolution of Scots social life, and to developments of Presbyterian worship led by Elders in ferm-toun and Kirk; although suggested by comparisons throughout this book, they have still to be seriously followed out. As to the future, regrouping of our somewhat scattered agricultural population has been strongly urged in planning for post-war housing and community life. But sound planning must be based on survey, long overdue; though elementary, this key map appears to be the first of its kind for Scotland (Fig. 2). It is from these units of farm-team and township that Scots rural society must be rebuilt, region by region.

One further contrast between the farming and the crofting communities demands attention: it lies in the types of migration—one is tempted to say, of semi-nomadism. Crofters, though they move to and from their croft and township—to the city, the sea, or the New World—return home to their native township when they can, and to no other. Many farm servants, on the other hand, though they usually spend their lives in the county or region of their birth, have been on the move from farm to farm, year after year. What is true of Lowland Scotland seems rather true of North-east England, but not of 'the English Plain'. Unmarried Scots farm servants were hired for the half-year, and frequently moved after each new hiring, the married once a year. Families were annually uprooted—if indeed they could be said to strike root at all! The war-time 'Standstill' Order for Scotland began to check this migratory life; but its effects remain. Hence many men have few ties, their wives still fewer. The children could not grow up with their schoolmates: they could look back to no "Auld Lang Syne", of which the

Lewis and Harris

Harris; South Harris is ringed by a road, extended recently to take in the more isolated 'Bays' townships.

2. *The Crofts and Crofting Ways*

The prevailing modern unit of cultivation and tenure in the Islands is the croft, the land held individually by each small landholder or 'crofter'. The Anglo-Scottish term croft (Gaelicised as *croit*) meant steadily cropped, infield land, manured and never left fallow, and distinguished from the unmanured outfield with its long fallows and poor out-turn. This term came into common use in the Highlands and Isles in the eighteenth and nineteenth centuries with the splitting up of the older unit of cultivation and tenure, the small joint farm, with its little team of fellow-workers or 'small tenants'. By 1830 group tenure had been replaced by individual holding of crofts, but with the pasture still held in common, as it is to the present day, and an allotted strip of the machar.

The Lewis croft consists of a nominal five acres of crops, of oats, barley (or bere) and potatoes, sometimes with recent additions of turnips, and more often a small hay crop. The word 'nominal' is used because during the nineteenth century the croft had often been subdivided between two or more sons, without addition by reclamation to bring each subdivision up to the acreage of the original croft. Moreover, in the hilly southern part of the Island, cultivation is in little patches instead of in continuous fields. There, narrow ditches have been dug and the soil heaped up to form little ridges about ten feet by four, banked up by turf. These are known as *feannagan* in Gaelic, or in English, 'lazy-beds'—a term in use as early as the time of Burt, two hundred years ago. Thus only about two-

3: Geddes K-4, 5 (1919-1952) 1955 ES10 Highlan
Lewis and

thirds of an area nominally under crops actua
them. It need hardly be said that such croft
support a family.

The means of cultivation have been either po
ploughs in the smoother north, or else the fo
(*cas chrom*), and the straight spade in the hilly sou
the almost obsolete foot-plough used on hilly gro
Rodel, Harris, in 1919. In the smoother lands fro
way and Barvas northward, however, the crofts
already laid out in parallel strips, no more than
fifteen feet wide, divided by open drains. Open d
increasingly been converted into underground d
which pony and plough can pass. The cattle fe
rough pasture or on the grass about the crofts
mented by hay cut with a sickle from the grassy
the 'lazy-beds'. Quite recently, rotation grass
sown on the arable strips, and mown for hay by t
Tractors were introduced in war-time, in 1942.

In many of the villages, cattle are still tak
summer pastures out on the moors some miles
crofts. Those who herd the cattle live in huts
ings, annually re-roofed. In the congested '
trict' (the Eye Peninsula), the cattle must go to
on the main island or be taken on to their own
from late May or early June to about the 10th o
in order to clear the common grazing and allow
to recover. This migration takes place, of cours
of the restricted area of common pasture. On
hand, pasture is plentiful in the parish of Lochs
round some of the villages, and here the use of th
has been practically abandoned. In almost al

"the lone shieling of the misty island". Traditional Gaelic songs tell rather of shielings grouped within hail, with their sweethearting and good cheer!

3. *Crops and Stock*, circa *1938*

As the thirties mark a transition between early conditions prevailing until 1919 and those of 1947–53 (Appendix I), the present tense is used.

Of the Island's 528,000 acres, including deer forests on the Harris border partly grazed, there are 24,000 acres of arable and grass land. Barvas parish leads with 6500 acres, then come Stornoway, Uig and Lochs, Harris being last with 3300 acres. Roughly one-third of the Island's arable and grass land, or 32 per cent, is permanent grass, chiefly machar, with a maximum of 39 per cent in Uig, but a minimum of 9 per cent in rocky Lochs, most of this on one small farm. About 10 per cent of the arable and grass land area is given to hay production; of this, rather less than one-third is rotation hay grown on the plough rigs or parks, and rather more than two-thirds is hay from permanent grass. Lochs, lacking machar, has 20 per cent hay, while Barvas, better off for machar, has only 4 per cent. Even this proportion of rotation hay shows an increase on the crofts since 1919. Stornoway parish, it will be noted, occupies an intermediate place, but if the facts for Point (Eye) district were contrasted with those for the villages along the machar, the differences between them would emerge clearly. As it is, they can be guessed from the vegetation map showing the machar. Oats is the chief crop, and occupies 33 per cent or just one-third of the arable and grass of the Island; excluding the permanent grass, it constitutes half the crop.

175 might be thought) in cured fish. Here is a sample Deposi-
• 241 tion from Borve (W. Lewis), a township then composed of
427 five hamlet-farms, or 'pennylands', with their share of
436 outrun, peats and fishing grounds over the whole and known as Five-Penny Borve.

Donald McGillimichaell, William McHomas, Gillichallum McCoilog, and John McConnell in five penny land of Borrow and Parish of Cladach afor[d] MAKE OATH severally that neither of them has any Tack of their possessions, But that each of them pay yearly to ye above Mr. Zachary McAuly for behoof of ye Countes (of Seaforth) for[d] Nyne Pounds Scots (*i.e.* 15/- sterling), Two Bolls one Lipie meall, Fifteen pound weight of Butter, and three-fourths of a mutton. Depone they and each of them are someqt in arrear but know not the Particullars, and this is ye truth as they and each of them shall answer to God, and depone they can't write.

(Signed) DAVID BETHUNE
(Sheriff Substitute of Ross).

175 The only point on which these good fellows must have
241 had to face qualms in 'answering to God' was their lapse
427 of memory as to 'Particullars of arrears'! None of the
451 222 small tenants could remember this! Although the
[642] Chamberlain or Factor, Zachary MacAulay, denied it, he
[613] may have exhorted or compelled payment of rent in order to forward it to the exiled 'Marquis'. Mainland rents were actually despatched to France from Leith in broad daylight under an armed guard of clansmen! At the same time, neither MacAulay nor the joint tenants were of Clan Kenneth, the MacKenzies. MacAulay himself was a man of high character—and a poet too—and not one to collect rents in order to embezzle them. His affirmation has the ring of truth, with little alloy. To the Government Commissioners he wrote that what made it impossible for Lewis peasant-fishers to have paid rent in full during civil war,

175 and still more to pay arrears, was "the rugged Hag,
• 241 Poverty, that would resist both King and Government".
427 We may guess that MacAulay passed a hint to the tenantry
451 that (in a good Gaelic idiom) they had better 'disremember' details of arrears: and this they did.

175 Of the four names on the deposition quoted, one or
551 two may have been surnames, others the patronymics of
613 kinsmen. As is still the custom, clansmen knew one another
[178] by names of many kinds. Stature or colour was used to distinguish a big John from a little one, a fair from a dark, or a pale from a swarthy; occupations such as smith or caird (artificer, not necessarily travelling tinker as now) were
[241] used, and also mere nicknames. Of the eighty-one crofters
[226] or fisher-burghers in Stornoway, fourteen were MacKenzies; and other mainland surnames, such as Fraser and Gunn, Matheson and MacLennan, also showed their descent from the immigrants brought in when MacKenzie of Kintail founded the burgh to encourage fisheries after 1611. Each held a single holding, usually rented at two shillings sterling.

175 To conclude, rentals about 1715 show (1) the character-
241 istic equalitarian grouping of small peasants as fellow-
427 workers in the hamlet-farms still held directly from the superior, Seaforth; (2) the eighty-one small burghers of
631 Stornoway; and (3) tacksmen, responsible for the larger part of the Island rent, but under whom we know that the labouring peasantry, though without the local independence of the others, also continued to dwell and to work together. The tacksmen were to pass away, as many of them had originally come, at the desire of a mainland lord, and the lord, in his turn, was to leave; but the small peasantry of immemorial stock still hold and work their land.

(c) FARM-TEAM AND BOAT'S CREW

175 The strictly equal division of rent on each joint farm
241 shows the equality of sharing among its workers by 'run-
427 rig'. By this system, periodic pooling and redivision kept
476 the land in convenient blocks, a wet part here and a dry
423 one there, all shared out to give each man an equal chance whatever the weather might bring. Such sharing was not mere static division of goods: it was the means for co-operative work, in ploughing and harvesting, or cutting peats, on land, and in manning a boat for the fishing.

175 For ploughing, two or three men were needed—one
241 leading the horses (walking backward and singing his en-
476 couragement), a second to hold the plough and perhaps a third to turn the sods; but four ponies abreast were needed to haul the plough, and each tenant possessed only one or two. In addition, the plough might be preceded by an instrument to clear the ground, a 'reestle', requiring two horses and one man. A Gaelic proverb notes the selection needed in the horse team, and one disabled by age could be replaced as leader by another. Ploughing was necessarily co-operative.

175 The rockiness and hilly ground of Uig and Lochs
241 diminished the usefulness and, no doubt, the number of ploughs, but the importance of their fishing was some
[182] compensation for poor agriculture. In 1790 there were
[134] ninety ploughs in Barvas parish, where they were no doubt of ancient usage: a ratio of one plough to five families, or
[226] one per joint farm. To judge from the smoothness of Stornoway parish, ploughs were probably used there in a similar ratio.

175 While some jobs were done by no more than two people,
476 —as when a ridge or 'lazy-bed' was put in order, the

175 couple advancing one on either side of it—many other
476 tasks were definitely team-work. Such was peat-cutting. "When they are making peats, five people are employed.
175 One cuts the peat, another places it on the brink of the
476 ditch where it is dug; a third spreads it on the field, a
314 fourth pares and cleans the moss; and a fifth man is resting, ready to relieve the man that cuts. The women are seldom
[462] at this work, but the men help one another alternately; sometimes they must rest satisfied with fewer hands; but the above is the full complement of men required to per-
[127] form the work, according to their tastes." Buchanan's
[178] description was written 160 years ago (1793); it remained true till recently and generally it is so still. There was thus a normal team practice for work—even a man to rest was not
[538] forgotten! As the Gaelic proverb puts it: "They won't make power (add strength) without a threesome and they'll limp without a foursome!" (*Cha deanar treine gun triuir,*
[802] *'s bidh iad crubach gun cheathrar*). In Gaelic, as in Scots, one speaks of a team according to its number, as "a pair, a threesome, foursome" and so on, up to a tensome (*deichnear*). In Lewis the farm-team was usually a foursome or fivesome.

175 Only in exceptional cases was land worked and held
423 singly—as when a smith was kept busy at his anvil in ploughing-time and harvest. Thus in 1715 one or two
241 rural smiths had single holdings of average value or more
[326] (£1), and one artificer or tin-smith (caird) a holding of minimum value (5s.); and in the burgh all the small plots
[286] were held singly. As the women wove, at home mostly,
[462] no male rural weaver held a single plot; his weaving could be done at slack times, so long as there was light; at busy times he worked on the land with the rest of his team.

000 On the mainland, both Lowland and Highland, an

Except in cold weather (as here) the skirt is rolled up over a petticoat to form a pad at the waist just below the creel

/facing p. 64/

311 In Lochs it occupies only one-quarter of arable and grass.
213 Barley, mostly four-row, or bere, is less important as a food today than formerly, and now occupies only 6 per cent, and, though it reaches 13 per cent in Barvas, with its
[632] machar, hardly any is grown in Lochs. Rye (*seagal*), still found in the machars of the Uists, is little grown in the Lews. Potatoes grow well everywhere, occupying about 15 per cent of the area, though townships with plentiful machar land grow most. Turnips are being gradually introduced, and though their liability to disease has somewhat discouraged the crofters, the proportion is now about
311 2·3 per cent. Cabbages occupy a small area (1 per cent),
244 latterly along with lettuces, carrots and the like.

Rotation hay and turnips being almost unused up to
• 241 1919, oats was grown repeatedly before rotation with barley or potatoes, and with no bare fallow. While heavy manuring maintained the fertility, the crop by July was ablaze with corn marigold (and other weeds) through which the thin oats struggled to rear its head. Thickly sown, the return was exceedingly small. Except for the machar (if any) there was no 'out-field' as elsewhere in old Scotland.

The smallness of the crofts and the poorness of the crops explain the very small total return. Hence little oats is now ground for meal and the potatoes do not last
[198] through the year, though few are sold. The low out-turn
[242] also explains why even fodder is scarce, though much more of the crop is secured for wintering than formerly. Summing up, a croft of 6 acres—though a little too large to be quite typical—includes a couple of acres of grass and hay, almost as much of oats, and the remainder bears potatoes and barley, with turnips, cabbages and garden produce.

In the past, the cropped land was unfenced and un-
[174] walled. At present, the rule is to encourage the con-
[178]

• 241 struction of a single ring fence round the croft land, which
[178] also circumscribes a good deal of rough grass, the ground being generally rough in parts. Individual crofts are fenced only where exceptionally large, or when the pos-
[654] sessor is unusually enterprising or is isolated. Depart-
632 mental help is given in the provision of fencing materials for a township, the crofters supplying labour. As the
233 animals are allowed to graze freely in winter, this limits
241 crops to those sown and harvested in the summer half-year —a serious matter for any man of enterprise who cannot afford a fence of his own. Cattle kept on the croft when the fields are under crops have to be either tethered or driven to a common pasture. A drystone dyke may enclose a small patch of garden, rarely well tended, the school gardens providing a laudable exception.

233 Shortly before 1939, the stock included under 1000 agricultural horses and well over 10,000 cattle (of which more than 6500 were milch-cows), but practically no pigs. Sheep number 42,000 ewes, or 94,000 ewes and followers in June. Thus there are 2·5 cattle on an average holding, of which more than 1·5 are milch cows; and there are
233 half a score ewes or about a score of sheep in June. The
178 size and the quality of the cattle have greatly improved since first I visited the island in 1919; at that time the mongrel Highland breed must have been the very poorest in Britain. The Blackface sheep are small, either through underfeeding or because of traces left from the old, smaller Hebridean breed, or from both causes. On an average there is, or was, one horse, or pony, to every five or six
23 crofter holdings, but their number is much reduced.
233 Actually, such Island averages for horses and sheep are somewhat misleading. In particular, either there are more
[182] horses than the average in a given district, or almost none,

233 according to the relief, as explained. Thus the Barvas
182 parish with its smooth topography permits of ploughing, and there is, or rather was, one horse between two crofts,
231 or one pair between four or five. In rocky Uig or in Lochs, however, there is only one pony between ten or twelve crofts.
492 Lending or hiring of horses has still to be practised, but
426 within manageable limits, though the increase in 'cars' had lessened the number of horses, even before the war-time introduction of tractors. Hiring is often done for cash, though this conflicts with older communal custom. Yet lending had its difficulties: "The borrowed horse", says the lender bitterly, in the Gaelic proverb, "is never tired!"

233 The number of sheep per holding is noticeably highest
184 in Harris, with one score ewes per holding. The sheep pasture of North Harris was well spoken of by Dean Monro, and the link with the home industry of Harris, its weaving, is evident.

• 241 Comparisons with the western mainland show, in
311 holdings of similar or rather large size, the diminished amount of cereals now grown there even by crofters. The increased proportion of grass reflects both the greater dependence on bought provisions, and also the fact that the West is not a land to ripen crops, but that it can grow grass for stock.

4. *The Moors as Pasture: Game and Sport*

311 In order to estimate the relative value of the rough
511 grazings of Lewis and Harris, it will be well to compare these with the moors lying across the Minch and east of Cape Wrath. There also may be found crofting communities whose economics are similar to those of Lewis, so that the stock carried on their pastures will furnish some

511 coat, was thought to be supernatural. The fishing, too, is
226 of good standard: a typical annual catch including 1700
511 salmon, 5000 sea-trout and 1800 brown trout; and it was for this, as well as for the shootings, that the moors pertaining to the different shooting or fishing lodges and hotels
137 were bought at Lord Leverhulme's sale. The absence of
233 foxes was important to sheep-rearing before the introduction of guns, and is still a favourable factor.

5. *Sea-fishing*

226 Fish have always contributed to the diet of the Islesfolk,
198 whether they fished from coracles or boats, or with 'lang wands' from the shore as they still do, and as they did in
[262] the days of Dean Monro and, no doubt, right back to
433 neolithic times. The relative importance of fishing and agriculture, however, has always varied according to place
• 241 and time.

182 Fishing in modern and historic, and also in prehistoric,
226 times—to judge from the kitchen middens of Uig—has always flourished more where there were deep sea-lochs;
241 and settlement resulted, even though rocky hillsides made ploughing difficult or impossible. Conversely, agriculture
[178] has offered better opportunity on smooth coasts with a
[172] variety of soils, though fishing was poorer there. Thus the men of Stornoway Bay and Eye, of eastern lochs and of the Harris bays, like those of Loch Roag on the west, have long been partly fishermen. In the extreme north, too, men of Ness—with the chance of choosing their fishing grounds on the north, west or east of the island and with their little rocky port giving shelter, of a sort, from south-
[467] west gales—were good fishermen; they are good seamen
[829] still. "The fishing of the Barvas folk" is an old gibe,

182 meaning that the men of that village, and its immediate
226 neighbourhood, were the last to put to sea and the first to
• 241 return. The Barvas folk could retort that they would
(829) have been fools to do anything else on a straight exposed
[461] coast; and that anyway their pony-drawn ploughs were of more use than the foot ploughs of the rocky south. A form of provender taken indirectly from the sea was the sea-birds and eggs from the sea-cliffs and islets like Rona, north-west of the Butt. This helped to support a few families in St. Kilda and on the rocky Shiant Islands south-east of Harris.

195 Fishing remained backward and primitive, however,
226 until the nineteenth century. After developing in a
(178) promising way, it was checked before the First World War, and fell into decay during and after it. Decay has,
504 of course, been widespread. In 1935 the chief ports of
501 the East Coast, from Leith with Granton northward by Fraserburgh to Wick—a round dozen—had still an average of 250 to 300 vessels, 3000 in all. These were chiefly of steam or motor auxiliary power and valued (with fishing gear) at £2,750,000. Orkney and Zetland, too, had each their 300 boats. The whole West Coast, however, from Stornoway to Ballantrae, had only 2000 boats, valued at less than one-tenth of the fleet of the East, and worth only a fraction of this, to judge from prices in the open market. Nearly 400 boats were still on the register for Lewis and Harris (Stornoway district) and another 300 for the rest of the Outer Isles. But fewer put to sea each year, even from Stornoway itself.

182 A major drawback to herring fishing in the Stornoway
226 district is the uncertainty in the movements of the herring shoals. On the Clyde, moreover, herring can be sent fresh to the city but further north they must be cured. Whereas

162 weaving and fishing, the fall in population would probably
(167) be small, if any, in 1941. This fall in the total figure was not so much a decrease in the number of families as in the
[168] number per family. The Island was only then following the restriction of population begun half a century before in the rest of Protestant Britain, though the causes, social and economic, are very dissimilar. Actually, little did occur to change either the rural situation or that of Stornoway, until the outbreak of war in 1939.

162 Since 1931 there had been no real decrease: Lewis is
178 a land of house-building, not of ruin and abandonment;
369 of increase of holdings, not diminution, and even of agri-
(657) cultural improvement. No doubt 'artificial' causes were at work: first, loans, grants and unemployment insurance and assistance—once known as 'the dole'—and, secondly,
[593] the money sent to elderly parents and dependants at home
(888) by young folk in Glasgow or abroad, or savings brought back by the young people themselves. Yet there is some
(226) fishing and agriculture still. Above all, 'hand-weaving' has grown, even if this be partly 'artificial'. Recently it
• 241 was not only the elders who had returned to the Island, but
[286] men and women in the prime of life, so that the question of resources, livelihood and population in Lewis needs to be re-examined afresh.

167 The emigration which took place from 1949 to 1951
(460) followed directly upon the losses and the unemployment in the Island's Harris tweed industry. This crisis resulted
(651) from the imposition in 1949 of a Purchase Tax on hand-
[162] woven Harris tweed of 666 per cent. If the tax had been maintained and no adequate adjustment made, the effects on population would have been far-reaching.

175 much of Britain and Europe until about 1700. A modern
511 parallel may be found in Asiatic lands with the frequency
162 of famines alternating with periods of recovery or, in others,
171 the long-drawn misery of chronic under-nutrition and endemic disease. In modern Europe, only international
(731) or civil war can now bring such extreme widespread misery. And as peace brings partial healing, so in the Island past, when good seasons returned after famines, the life of the family renewed itself.[1]

175 The narrow margin of survival even in good seasons,
593 the risks of the bread-winner's death and of his family's destitution, and the need of co-operation in so many tasks made the family too small, weak and precarious a unit to stand alone. Even with relatively little division (or specialisation) of labour, and in spite of its apparent self-sufficiency, the family had perforce to link itself with wider circles of community life.

(B) JOINT LABOUR BY SMALL TEAMS: THE EVIDENCE OF TENURE IN 1715–26

175 Romance is hidden among the rent-rolls of the Seaforth
• 241 estates, all of which were forfeited when the Earl rose for
427 'King James VIII' in 1715. For of the rents withheld from the government until 1720, on the mainland at least
(642) the loyal clansmen paid a considerable portion to their
[613] exiled chief, styled 'Marquis' by 'King James'. But the

[1] The 'ups and downs' of a peasantry living on the margin of subsistence and subject to severe disease can be studied in India, 1871–1941, where the 'net' or mean change has to be correlated with the 'variability'. This wide problem was reviewed in a series of papers to 1948; "The Social
(113) and Psychological Significance of Variability in Regional Changes of Population", with examples taken from Indian villages. (A. Geddes, *Human Relations*, Vol. 1, 2, 1947–48; cf. *Geog. Rev.* 1942 and 1948; and *Geog. Journal*, 3, vol. 98, 1941).

195 rent-rolls record something of more vital and enduring
• 241 concern, the unit of community life in the Lews. This was
427 the 'conjoint' or 'group' farm of the labouring peasantry
(476) —though it was overlaid in parts of the Island by the formation of tacks held by gentleman rent-farmers.

Both rolls are Judicial Rentals, that is to say, the
195 tenants, great and small, were convened by the Govern-
241 ment Commissioners and examined on oath as to the rents
427 they formerly paid; the accounts were then entered and totalled. Because of the Jacobite resistance, the small
656 amounts of rent and the maladministration of the Forfeited Estates, doubt was cast upon the first rental, of 1718. A second rental was therefore compiled in 1726, upon a different system, which confirms the correctness of the first.[1] All were named, including those absent or 'valetudinary'.

195 Owing to the Island's comparatively smooth land sur-
361 face and access to the sea, the people could group themselves as they chose. Whereas in the Highland mainland many
(182) a pocket of land is too small to keep more than two or three
(184) families alive and no fishing grounds are available, in Lewis the people could join together in teams of four, five or six,
(433) to work a hamlet-farm or penny-land, definable as a
[476] joint-farm of unit size, and to man a boat with "four to row and one to steer".

195 The first point of interest is the equality of the shares,
241 each man paying exactly the same as his fellow-tenants for his 'farthing',—a fourth, or other equal share of the farm.
427 An average share of rent was a little over 10 shillings sterling
(436) with additional payments in farm produce, though not (as

[1] A. Geddes, "Conjoint Tenants", etc., *Econ. Hist. Rev.*, Second Series,
(113) vol. 1, no. 1, 1948, pp. 54-60. This reconciles the evidence of 1718, reproduced in the Brand Report (1902), Appx. O, and that of 1726, edited by J. R. N. Macphail (1916).

widespread plant community in Lewis is undoubtedly the *sedge and cotton grass moors* (or ' mosses ' as they would be called in the Lowlands), which overlie deep peat generally at low levels, on flat or slightly rolling grounds. The peaty floor is waterlogged and boggy, and the carpet rises into tufts, dense cushions or mops, out of which bristle innumerable stalks, thread-shaped, sheathed, fibrous and elastic. There are few flowers apart from the bog asphodel, while heather does not thrive but is stunted. On the slopes, sedges (*Scirpus* and *Carex* spp.) and cotton grass (*Eriophorum angustifolium*) dominate, and in the hollows, sphagnum moss. Owing to slope and consequent erosion, the surface may break into hags (or ' bruachs '), separated by deep and more or less broad channels of bare peat with puddles.

For reclamation by tractor and peat plough, smoothness is essential, combined with some slope for drainage. From observation of the fragments of poor pasture topping the hags in channelled eroded peat, it can be noted that drainage alone is not enough to create good pasture, though it is the first step. In order to complement the work of drainage, fertilisers must be applied to encourage plants which absorb water in quantity and transpire it freely in the course of rapid growth. For it may be said that plants like heather—adapted to withstand drought, physical or ' physiological '—do not transpire water in any great quantity. Thus they fail to ' drain the ground from above ', as juicier grasses or fodder plants do by the vigorous ascent, transpiration and renewed absorption of water.

(5) *Heather Moor.*—The common heather (*Calluna*) dominates on many steep slopes and rocky bluffs, sometimes on acid humus, or again on decomposed rock and screes, generally at low levels. Among the chief plants

that the spade and foot-plough (*cas chrom*) were used for double the area ploughed. From Monro and from the precise Statistical Accounts of the eighteenth century, it is clear that pony-drawn ploughs were usual in the smoother parts of Lewis. In North Harris are ' abundance of Deir '. We must not forget here that ' faire ' and fertile are comparative terms for the West. " Lewis is faire and weill inhabit at the coste, ane fertile and fruitful countrey, for the maist part beire [barley], with 4 Paroche Kirkes." There is " ane castell callit Stornoway . . . with 3 salt loches, very fine for take of herrings . . . [and] infinite fresh water loches. In the Lewis there are 8 waters with take of salmont. . . ." There were also " Whales . . ." In " a cove 2 fadoms deep at the ebb sea, uses Whytuns (whitings) to be slain with huiks ", there were " very many haddocks and Men with their wandes sitting [as today] upon the Craiges of that cove, and Lades [boys] and Women also. . . . In this Ile there are many Sheip for it is very guid for the same. For they lay furth ever one mures and glens and never enters in a house and their wool is bot anes in the zeire pluckit off them in some fauldes." In Zetland wool is still plucked, not sheared.

The description of reclamation is specially worthy of note: " In this countrey all is peit mossland at the Sea cost, and the plaice where he wins his peitts this zeire [year] . . . there he sawes his corne the nixt zeire, after that he guidds it weill with Sea ware " [*i.e.*, improves or manures it with seaweed]. On " Ellan Colm Cill [an islet apparently on the east coast south of Stornoway at the mouth of Loch Erisort] Macloyd of the Lewis has ane faire Orchard, and he that is Gardener has that Ile [rent] free. . . ."

Around the coast of Lewis no absolute limit is set to

reclamation, which Dean Monro has described as he saw it. Technique and economic return must be balanced against the factors of nature. Although natural conditions are difficult, they may not form a complete explanation of the relative arrest of reclamation in the nineteenth century; for here separation from the agricultural advances of the Lowlands by barriers of mountain and sea caused the retention of unprogressive methods until the wave of agricultural improvement had spent itself by the middle of last century. To this cause must be added other influences contrasted to those leading to peasant advance in the rest of Western Europe: the political history of the Gaeldom after 1745, the revolution in land tenure and in the social life of the upper classes, the commercial, industrial and imperial development of Great Britain. All these factors help to explain the contrast offered to the Lews by western Denmark and western Norway, lands in which the soil and climate are comparable to those of the Island. Yet reclamation is proceeding, as on skinned land at Ness, where plots of ground have been steadily broken in by pick and by spade or plough.

Settlement and agricultural land are placed around the coasts with their fishing grounds. In spite of what was often said—that the Lewisman is and has always been primarily a fisherman—fishing alone is not enough to account for this distribution, for the agricultural conditions on the whole are also best along the coasts, or were so for early settlers. As Stevens remarked, the light sandy 'machar' lands are there, and the fringe of partially improved soil close by; drainage is, on the whole, better, while shell-sand and sea-ware are to be had for manure. The sea-ware also serves still as fodder, while one or two sorts are sometimes cooked for human food; carragheen

(Chondrus), for example, is used as a thickener of milk to make a cheese-like mould. Dulse is also plucked.[1]

The type of coastal form and vegetation alters the relative importance of crofting and fishing—and the balance chosen is significant. (1) Where the coastline is smooth, and leads inland from sandy machar with its clover to sand-ameliorated 'black land' of smooth topography lending itself to ploughing, and the whole is backed by extensive pastures, the tract is relatively well-off for crofting but may be ill-placed for fishing. (2) Where the coast is either indented or salient with rocky loch-sides or steep promontory cliffs, a rolling or rocky topography, little shell sand, and (on the promontories) a shortage of pasture, it is ill-placed for crofting; but it is favourable to fishing either by virtue of sheltered sea lochs or of salient promontories, one or other side of which tends to give relative shelter to the fishing ground (chosen according to the direction of the wind, to avoid being blown on to a dangerous, lee shore). Hence the site of a settlement has had much to do with the choice and opportunities for a communal vocation, from prehistory to the present time, as we shall see.

Significant local characteristics emerge in the names of the ancient districts (inset with the Map of Vegetation, Fig. 8). In the north is Ness (Norse, 'nose' or cape); along the west is Cladach (Gaelic, a stony beach); while in South Harris the western 'Machar' contrasts with the eastern 'Bays'. 'Park', a sheep-run in the early nineteenth century, was the Norse 'East-fell'. In contrast, the parishes of Lewis centre on four churches, linked to the road-system. This radiates from Stornoway in five directions: east, NE., NW., SW., and south to Tarbert,

[1] Pulling dulse (*Rhodymenia*) is one of the 'delights' of Iona as told in a poem long attributed to Saint Columba!

On the mainland, both Lowland and Highland, an outlying reclaimable patch of arable, lying near distant, litt used pasture, frequently gave a single family the chan of a living. Such a site meant solitary toil for the m and his family; but there might be advantages such an occasional deer from the forest, or a post as hunti 'forester' such as was held by many a Gaelic hunt bard. In the Eastern Highlands such a high-lying croft w known as *Ruigh* (anglicised to Ry-). Traditions of pove with individuality in isolation were handed down, example, from one of my forebears who held such a *rui* Rycorrach, one of several strung out along the 1250-f contour in a small, high valley off Strath Spey; the l of them was abandoned only recently. Such a *ruigh* m have originally been a summer shieling, only occupi when shortage of corn-land below, coupled with n possibilities of a little profit from sheep-shearing, led settlement there.

At the fringe of the Island's deer 'forests' of No Harris and Park, stalkers are still found in lonely lod and dwellings, individuals often of character and worth, they need to be; and a few isolated shepherds, such one finds on mainland sheep farms, dwell on small isl But in the Isles, isolated, high-lying spots for single cro are rare. And the clearest distinction must be dra between the true solitude of a single, isolated cottage croft and the sociability of a group of four or five, or ev two or three, crofts, such as those of lobster fishers; even a few families form the germ of a community, in w and in leisure.

The potentialities of co-operative practice were ov looked by agricultural reformers, excusably enough. when new methods were required, run-rig kept back pace to that of the slowest, virtually arresting reform. So

through division of labour or united effort, but simply for the sake of mutual stimulus and pleasure!

(10) THE SHARING OF MACHAR, MOOR AND SEA

Embracing several joint-farms, each with its team or crew, came the township. The township had not only its common pasture, it had a special extensive system of run-rig on sandy, coastal machars, as in parts of the Island and in Uist—a system continued to this day.

On the machar of Barvas, cultivation strips are still re-allotted periodically, as they were annually on all the Island machars. The machars behind the 'storm-beach' dunes of the Outer Hebrides closely resemble one another, from the Butt of Lewis to Barra Head. The immemorial system was noted by Walker and more fully by Carmichael, who called it 'intermediate run-rig' to distinguish it from the run-rig of older joint farms on boulder clay, and it persists at the present day.[1] In North Uist the machar land is laid off in large scatts or fields. Each scatt is divided into as many rigs as there are crofts in the township. There may be a dozen scatts in all, and usually half the number are lying out in natural pasture, but they are put under crop in rotation, so that each year one or two scatts will be brought into cultivation, and the others left out after a course of cropping. When a scatt is to be brought into cultivation the township 'constable' (who holds sway under the district ground officer) appoints a day for allocating the rigs.

[1] Walker (1808); Alexander Carmichael, appendix xlviii and xxix, pp. 213 ff. and 451 ff., Report of the Crofters' Commission, 1884. Socially these form the most significant evidence in this antiquarian's Report. See also "Creasing and Agrestic Customs", *Celtic Review*, 1905. Ct. C. Macdonald, *Scot. J. Agric.*, 1919. See also his lively accounts of machar and pasture: *Highland Journey: Sail air ais*, 1943.

rigs. The rigs are numbered and then balloted for by a double ballot. First the men approach the hat in any order and pick out a number: this is to decide the order in which they will approach the hat in the second draw. The second draw then decides the number of the rig. The crofter retains the rig while this particular scatt remains in cultivation, usually for a period of two or three years. The machar is shared by the whole township. The crops grown include a light type of oats, barley, a little rye, and potatoes; and clover may be cut.

In the division of the machar for potatoes at Barvas, there are now no such hard-and-fast rules. The Common Grazings Committee select a certain area for cultivation and each crofter is allowed to take as much land as he requires within this area. This land is only cultivated for one year in six to ten years, and then reverts to grass. If cultivated for two or more years in succession there is a danger of the sand being blown away, and grass would be difficult to establish again. Potatoes are now the only crop grown on the Barvas machar.

Beyond the machar of the Isles lies the moor with its fringe of reclaimed croft land. By Carmichael's day this was held in individual portions, though, as he said, most of it was once held in 'farms' in run-rig practised by small units, not by the whole township. Why this difference between the arable of the machar and of the moorland? Carmichael did not explain it.

Three explanatory points are, first, that the whole cultivated land of the scatt or the machar is continuous, whereas the moorland is hummocky and boggy by turns, and cultivation is therefore patchy; secondly, that, unlike the stony clays, the light shell sand is easily forked or ploughed and needs no 'team' to plough it; and thirdly,

that no initial reclamation had been needed on the scatt. In each year of cultivation, it is true, manures of a sort, principally seaweed and sooty sods from the roof, are applied; but they form a temporary improvement only for the crop to be taken, and do not constitute reclamation. After manuring, the grasses and clovers are simply turned over and the land, 'rested' and manured by cattle, straight-way gives its best crop.

It is otherwise with what is won from the moorland. As Dean Monro wrote of the reclaiming Lewisman in 1549: "In this country all is peat moss-land at the sea coast" (the long machars of the west of Uist give place to rocky coasts round much of Lewis), "and the place where he wins his peats this year, there he sows his corn the next year; after that he guids it weill with sea-ware". Even where the slopes are fairly smooth, the peat land has not the uniformity of the machar and the continuity of its arable strips. In addition to sea-ware, sand may be brought by creel or by pony pannier to reclaim peat, forming a heavy burden. Moreover, the first crop is always a poor one, and may be almost lost. Although in his brief notes Monro used the singular 'he', we know that the peat was usually cut co-operatively by teams. Hence most of the hard labour of reclamation may, indeed must, have been done co-operatively too, but by small teams, not by the members of a whole township together.

The sharing of common pastures is the last, but important, feature of land holding in common. The two kinds of pasture required were, firstly, those close at hand, animals being tethered or herded in the crop-growing season, and secondly, the more distant summer pastures. The people of certain townships, which were without a large outrun close at hand, had to go some distance to

reach their shielings. From Point district (Eye Peninsula) the cattle are still brought inland to the moors south-west of Stornoway. And from Bernera on the west the cattle are swum to the hills of the main island, just as they once were swum from Bute to the hill-pastures of Cowal in Argyllshire across the Kyle at the 'Strait of the Swimming', Colintraive (Caol-an-t-snaimh). Nothing could be more natural, indeed inevitable, than pasture in common where large, open moors were to be found. The number of animals allowed to each holding was duly apportioned and then, as now, was known as the summing or' souming', still checked at the annual gathering (*cogorsach*).

Thus a cluster of conjoint farms shared "the grass on the Ben and the tillage on the machar" (*Fiar air beinn agus peighinn air machair*). Along the shore, sea-ware, drift-wood and the like were allotted, too. And, as Carmichael put it, there was even "run-rig at sea", for the fishing banks were allotted among the available crews. Most of these rights are still shared by the members of a township. But any crew can now fish freely where they choose, and no township can legally keep away strange boats, nor even steamers beyond the three-mile limit. This loss of communal rights stands in the way of remunerative fish-farming and its promise.

Profound social implications distinguished these three concentric circles of community: the family; the farm-team and boat's crew; and the larger, township group. These implications concerned labour, duty and right. The labour of reclamation gave a' right' to the land thus won from the moor; and the duty of labour together, for fruits equally shared, gave the farm-team and fishing crew cohesion on land or sea—team and crew working for a common purpose. On the other hand, as individual sharers in the common

(a) SACRAMENTS AND RUNES OF LABOUR, IN FAMILY, TEAM AND TOWNSHIP

Labour given to the winning of food, shelter and clothing was begun and blessed by poetic, rhythmic prayers or 'runes'. The words were usually reinforced by a symbolic gesture or simple rite. By help of the runes the people sought spiritual preparation for work, invoked aid and finally consecrated the thing made for use.

Wherever work was rhythmic it was carried on by working songs. Songs of hunting or herding recalled the hill and pasture, or praised the landscape with an exuberant flow unequalled in any tongue we know but old Irish, with which Scots Gaelic is so closely linked, or Welsh, of which the nature classics are linked to the epics of the sixth and seventh century thought to be composed in Strathclyde.[1]

Yet it was not these but the rhythmic prayers or runes which initiated labour, stage by stage. They are paralleled among many peoples, but those of the Gael possess rare fullness of meaning and beauty of imagery, words and form. When labour was ended, the food won or the clothing made was consecrated for the use of family and friends, of the poor and the stranger-guest.

In the struggle for food, the sowing and reaping of corn ranked highest, followed by its parching and grinding (*Carmina*, Nos. 88-92). The preparation of seed for its sowing was accompanied by its consecration, *an coitreageadh sial*. Similarly for reaping: "Laying his bonnet on the ground, the father of the family took up his sickle and,

[1] Examples of these nature poems are given in scholarly prose translation by Kenneth H. Jackson (1937 and 1950). Songs with their melodies will be found in Arthur Geddes (Ed.), *The Songs of Craig and Ben*, vol. i, 1931.

facing the sun, he cut a handful of corn. Putting the handful three times round his head, the man raised the '*Iollach Buana*', reaping salutation,—and the whole family then took up the strain." While these notes by Carmichael describe the custom after the abolition of the farm-team, he also tells of "all the people of the Townland going together to reap" (*Carmina*, No. 89, cf. Note to No. 90). In the days of close partnership this was no doubt a team blessing, said by the chief reaper among his neighbours in mutual aid.

Grace before meals survives in Presbyterian households; and ancient graces are recorded in *Carmina*, vol. iii. The unpublished examples given here are from Miss Annie Johnston (or NicIain), Barra, to whose knowledge Gaelic lore owes so much:

1. O God, bless our portion, and our people.
2. O God, be about the beginning of our life (or food) and about the end of our life (*lit.* of our world).
3. O God, let nothing enter our bodies that may harm our souls.

A Dhia, beannaich ar cuid 'us ar cuideachd.
A Dhia, bi mu thus ar bithe (or *bidhe*)
'us mu dheireadh ar saoghail.
A Dhia, na leig dad 'n ar coluinn a ni lochd do'r n'anam.[1]

[1] The reader will note the meaning in translation; but he should also scan the Gaelic, and the assonance of the vowels. In the first and shortest there is a simple play upon sound and meaning: *ar cuid 'us cuideachd*—" our share (of things) and our (share of) people, friends and family". In the second, Miss Johnston thinks there may be a play upon the words 'life' and 'food' (of which the sound is almost the same), reminding one that food is the means of life and of all that life means. In the third the apposition of ideas is characteristically emphasised in the pattern of the accented vowels in the words "*dad 'n ar coluinn a ni lochd do'r n-anam*"; here again the form, by means of which it sank through the senses into the heart, marks its native origin. Contrast with these the translation into Gaelic of a common English Grace. As in the English original, its prose lacks poetic form: *Tha sinn a tsart taing dhut, A Thigearna, airson san tiodhlaicean a tha Do mhaithes a' bailseachadh sinn, troimh Iosa Criosda ar Tighearna.* Amen.

magic is always efficacious—however desperate the need, however pure the motives of those who ask. These men were said to be the most successful fishers in the place; they were also Elders of the Kirk, who saw no wrong in what they did. They did not inform the minister; but the good man was not a fisherman and did not understand either the mysterious ways of fish or the incitement of a crew!

While this *neid fire* was kindled in all earnestness, a miming song-dance I have seen in Eriskay is pure fun: "the Carline or Witch-wife of the Mill-dust' (*Cailliach an Dudain*), who falls down dead and is brought to life again! Once, perhaps, a half-remembered symbolic 'play' of the seasonal fall and resurrection of seed, it is certainly in form and spirit a thing of happy laughter now! Tales were retold by Martin and a seventeenth-century English skipper, of offerings made to a sea-god, Shony, at Eoropie, Ness, for the sake of seaweed, followed by feasting and drinking in the chapel there.[1] The story may be garbled or, if true, may record a pre-Christian survival turned to merriment and of no more significance to the people of the time than 'the Carline of the Mill-dust'. The prayers for the seaweed necessary for agriculture and daily bread are Christian in spirit.

When the people were at the mercy of periodic famines, diseases and sudden death, there were ample grounds for fears. Hence a word must be said of a belief widespread and ancient in the Old World, 'the evil eye' (*droch shuil*). In the absence of clinical diagnosis, a malady, or a misfortune to oneself or a valued possession, might cast suspicion on someone present when it occurred; and

[1] W. C. Mackenzie, 1919, pp. 143-208. Contrast *Carmina*, vol. iv, pp. 33-35.

175 death of Sir James had left his widow in possession of the
423 estate, a lady with little training for its responsibilities.
In south-east Lewis, in November 1887, a body of landless
466 men attempted to settle on the peninsula of Park, Loch
Seaforth, after which some of the illegal settlers or raiders
were tried and acquitted, and fourteen small crofts with
outrun were provided. In January 1888, 300 men marched
from Barvas to petition Lady Matheson that the sheep
farm of Galson should be allotted to some of them at a fair
valuation, as they could not live on their tiny plots. Lady
Matheson refused to consider the petition until the arrears
of rent due by Barvas tenants were paid. Less than a week
after, sheep were driven off Aignish (Eye) and police, rein-
forced by marines and soldiers, arrested eleven men. Two
days later, more sheep runs were invaded, fences de-
[701] molished, and sheep driven off. On January 20, 500
marines were ordered to Lewis (of whom 200 actually
[681] sailed). On February 2, the Aignish raiders were found
guilty and sentenced to terms of from nine to fifteen months'
imprisonment. After this the disturbances gradually
passed away. Yet the seeds of trouble only lay dormant;
they were to spring up a generation later, and again after
the war of 1914–18.

175 In defending the Napier Commission's plan to recog-
637 nise the township, one may accept their definition of it as
427 a farm held by tenants, singly or in common. Yet it must
be remembered that the word 'farm' had come to have a
very elastic meaning. The joint farm-group was once the
• [241] active group for labour in common; but if the 'township'
included several joint-farms, as it generally had in the
Island, its people formed a relatively 'passive' community.
Members of the township enjoyed rights in common, and
shared in duties of observance; but they had seldom to

175 co-operate in active endeavour. It was all the more
632 important to have an elected 'official', the Constable,
427 one of themselves but placed in authority. There could
be no restitution of the old joint farms where they had
• [241] been broken down by migration. Yet it should have been
[624] still possible to extend the old spirit to the larger townships,
as the Commissioners held.

175 Again, the constitution of the township is bound up
632 with the rights of common pasture upon the moor all the
423 year, and in winter even on unfenced arable; but the
671 Crofters' Act failed to regulate the rights and obligations
of Common Grazings. It slackened the authority of the
estate without restoring the hold of the tenant community
upon its members. After five years the Government began
to recognise the mistake, and passed the first Crofters'
Common Grazings Regulation Act, permitting the crofters
to elect a Common Grazings Committee. But it was ill-
considered; most of all because non-crofters, that is,
[733] cottars and squatters without legal tenure, were not bound
by the Regulations. On one hand they could not get per-
mission to 'resume' (or enclose) a portion of the outrun,
in order to reclaim it as a croft, without first obtaining the
unanimous consent of the township's crofters; and in large
townships there might always be an objector. Yet each
cottar could, and did, put on stock, a cow or two and a
few sheep, ignoring the possibility of discipline.

In 1908 a second Act was passed; but twenty years
had allowed tradition to lapse and difficulties to accumu-
late. In Isle Scalpay (Tarbert) for instance, by 1909 there
were only forty legitimate crofters, but eighty cottars; and
the legal crofters would not take part in depriving any
[476] cottar of such grazing liberties as he exercised. All were
[462] neighbours and most were relations, and their principle

175 rural Islanders throughout the nineteenth century and even
182 today.
197

From 1887 the State made efforts to improve the
crofters' lot. Crofters' claims to stake shares upon the only
175 available reclaimed land in the Island, that of a few farms,
654 had been refused in the 'eighties, but came to be granted,
• 241 in principle and in fact, after 1900. During the war of
429 1914–18 the Government reaffirmed its promise to divide
sheep farms into crofts for men returning from the Services,
and the Land Settlement Act became law in 1919. Yet in
spite of tentative experiments and schemes, a determined
effort to see the Island possibilities and face its problems,
as a whole, still remained to be made in the twentieth
century.

175 When war broke out in 1914 over 5000 men left Lewis
161 to join the Services, and corresponding numbers left from
72 Harris. Others, too, served in the Merchant Marine, ex-
701 posed to U-boat warfare. From the first months of the
war, Lewismen in the Seaforth Highlanders, and men from
Harris in the Cameronians, fought in the Highland Division
as shock troops in its attacks which cost the Division
the highest casualties of any in the British Army. The
Lovat Scouts, the Mountain Battery, the Garrison Artillery
and other units, also enrolled their men, and suffered loss.
175 The last blow to the Island came after anxiety had ceased.
161 Early in 1919 the transport *Iolaire* struck a rock and sank
at the entrance to Stornoway harbour; and 200 men who
731 had withstood dangers and hardships during four years
of war went down in the dark to offer him elsewhere, they stood
within call of their waiting relatives massed on the pier to
welcome them.

362 of new steadings. The average amount of loans (totalling
652 £166,000) was under £150; repayment has been satis-
factory, and the arrangements made by the Department
of Agriculture won general praise among the people. Yet
433 crofts less remunerative than the farmer they dispos-
427 sessed; even together they may show little more total
production than the farmer. Nevertheless, these ten crofts
• 241 each allow a part, at least, of the basis for a country home.
[423] Hence the weight of public opinion supported, nay, insisted
654 on 'giving back' the land to the descendants of those who
423 had worked it sixty or a hundred years before. The State
bought the farm stock at a high valuation, and till lately
without adequate reform of crofting use and wont. The
farms having now been divided, a great emotional issue,
which had smouldered for half a century, has been brought
to an end. Although the practical results are small, the
crofters feel that justice has been done, and that fact may
311 be a great gain. Now that there is no more green reclaimed
land to be had, the reclamation of the peat moor, or the
grey 'skinned' boulder clay has to be faced.

By financing the renewal of Leverhulme's brief attempt
to reclaim deep peat on Arnish Moor, south of Stornoway,
the Canadian, T. B. Macaulay, made a resolute attempt to
[241] solve the island's main agricultural problem. Good crops
were grown, potatoes and silage produced, and a dairy farm
established. But the difficulties called for continuity of
effort and research. From the practical point of view of
'demonstration' it had been a mistake to tackle deep and
almost level peat, black in colour and viscous in consistency.
[407] There was not the light machinery required for cultivation.

311 And when laid down in permanent grass for the dairy herd,
the land became water-logged in wet weather. The war
called a halt to progress; and though much was learned, the
farm was not a demonstration of success. Smaller experi-
ments were made, with some success, in improving
'skinned' land. For both types of land, the cost of fertil-
isers, even more than of labour, was the chief economic
difficulty.[1]

A difficulty which aggravates 'congestion' in crofting
311 townships is that even a small croft may consist of several
• 241 plots. This was only too well illustrated, as late as 1935,
423 by the dilemma in which a crofter found himself, in a
township north of Stornoway. This crofter's land was in
at least five separate strips, mixed up with the land of four
neighbours. The township and the plan of the holding are
known to me. As the crofter complained, he could not walk
round his present cottage, nor bring building materials for
a new house to the site, without trespassing. He could
not even put up scaffolding because the stays at each end
would project on to the holdings of his neighbours, who
objected. The Land Court has power to re-allocate the
land in self-contained holdings. This crofter had twice
asked for this to be done, but on each occasion neighbours
opposed the application, and it was not granted. As he
could not replace his present house by a modern one, he
applied to the Stornoway Estate Trustees for another croft
in a neighbouring township. When the Trustees saw a
[241] plan of the holding they described it as a jig-saw puzzle;
but having no holding to offer him elsewhere, they could
only ask the Factor to try to make an amicable arrangement
with the man's neighbours. This case is extreme; yet it

[1] W. G. Ogg and Angus Macleod, *Scottish Journal of Agriculture*, 1930–36.

311 illustrates the narrow margin of habitability on these frag-
• 241 mented holdings.
423

Now, in Lewis periodic pooling and exchange, or the
practice of *movable* run-rig on the small joint-tenants'
241 farms, was abolished early in the nineteenth century, except
423 upon the machar, where it still continues. Apparently the
strips were simply fixed where they had last been appor-
476 tioned by lot. Subdivision of the little crofts among sons
198 and grandsons followed, owing to inheritance without re-
[175] clamation. Fairness gave 'the patchwork quilt' described;
but it was fairness pushed to the point of folly, for differ-
ences in soil from one adjacent strip to another were slight!
It is otherwise with the long, narrow plough-strips which
run from the houses on the pure boulder clay down to the
sandy shore: run-rig, movable or fixed, is understandable
and necessary there. The case just cited shows how a
sensible communal tradition, such as that of '*movable* run-rig' with periodic pooling, may degenerate into ab-
surdity by fixation. Happily the machar still shows the
same maintenance of a tradition, the pooling of resources.[1]

182 In 1924–25, widespread distress in the Isles, the failure
161 of the Leverhulme endeavour, the crofters' refusal to own
their own crofts, and the emigration which followed, caused
many outsiders to forecast rapid depopulation. It was all
182 the more interesting to note the confidence in the Island's
161 future shown by buyers of the great estate, all of whom
471 knew what they were about, for they were men with
experience of the Island, of its rates and rentals and of its
people. To a wealthy man who repurchased a sporting
[113] Apportionment of lands held in run-rig in the Carloway estate is described, and the principle discussed, in *Scottish Land Court Reports*. (See *Scottish Law Rev.* vol. 58, 71: July 1940, pp. 51–54.) At the same time 'mechanisation', or the co-operative utilisation of tractors had led to plea for 'collective farming'. (*Stornoway Gazette*, February 1944.)

464 For a year or two after the war many men and women
[286] returning from the Services, the sea or the factories found
[192] employment in the flourishing Harris Tweed industry.
This included work in the spinning mills and hand-weaving
at home—work in which the male weaver was helped by
[220] his family in jobs such as bobbin winding. Few fishermen
[198] dared to risk capital in new boats and risk losses
[462] such as those sustained after 1920. Few women wished to
return to the hard, uncertain work of gutting. The whaling
station, built on West Loch Tarbert before 1914 and open
for a short time between the wars, was reopened in 1950,
and employed some 30 men for 18 months before it closed
• [241] in 1952. Crofting was lightened by some mechanised
cultivation. The war-time construction of air-fields had
[722] ceased, though some harbour-work and road-making was
[654] assisted by government grants.

In 1949 the Harris Tweed industry, now the Islanders'
288 main source for earning, was crippled by the imposition of
[651] a 66⅔ per cent purchase tax on hand-woven Harris Tweeds.
[416] Parliament decided that as a non-utility product, its export
[433] sales alone could be exempt from tax. Viewing the
[171] position of the tweed industry in Britain as a whole, there
were strong arguments for the extension of the tax to
Harris Tweeds: the high-grade industry of the Scottish
Border or the manufactures of the West Riding should not
be subjected to unfair handicap. At the same time the
crippling of a handicraft practised by peasant or artist
favours mass-production to the loss or ruin of traditional
and experimental workmanship or design to which, in the
end, the mass-production is an unacknowledging debtor.
The obvious economic handicaps of Island hand-weaving
[439] may surely permit some latitude. The export trade in
[456] Harris Tweed, in which the imponderable 'sentimental

after 1800, John Walker wrote that run-rig, " formerly very general in Scotland, was abolished with improvements but still subsists in many parts of the North. A number of tenants of the same farm have a common pasture for their cattle, and the arable is divided among them, by ridge and ridge alternately, which each cultivates for his own behoof. This gives them all a common interest in the crop and, when there was no inclosure by dyke or hedge, might be of some advantage " in giving each person some protection " against the encroachments of his neighbour's cattle ". Speaking of joint possession this time, though without reference to survivals, Walker wrote that in the Lowlands " in old times a large farm might be occupied by a number of conjoint tenants who cultivated the farm in common and divided the produce. In this way the interest of each became the interest of the whole. They were ready, and were frequently called upon, to defend the common crop and cattle against depredations. There was then a necessity for such an allotment of land, especially in the Border country and in the Highlands." The team, in other words, was a unit of defence. But " nothing like improvement can be expected from farmers placed in this situation . . . [and] no community can ever equal the carefulness and industry of an individual in the management of his affairs ".[1]

So far as it goes, such an analysis is incontrovertible; for Walker was one of many contemporary observers who could contrast both the " improvement, industry and carefulness " of the best individuals under a vigorous landlord, with the sluggishness of old-fashioned ways on backward estates. The fundamental reason for sluggishness was that

[1] John Walker, *Oeconomical History* [descriptive account] *of the Hebrides*, 1808.

175 the cultivable land and pasture having been shared out to
178 minimal fractions, they called for a minimum of labour by
241 the men—though housewives and mothers had always
476 plenty to do. The morrow's tryst for work might prove
654 a tryst with no work done. The men might foregather
423 on the moor to cut peats, for instance, but if one of their
[181] number was late, become so absorbed by telling stories of the Fenians that, ere work had begun, it was time to go home—resolved to meet for work some other day! As a result, reformers advocated breaking-up the joint-holdings; and this was done in Lewis by 1830, as noted in the Brand Report. But mere division of the land did not increase its total amount.

175 Yet while noting the progress made by the liberation
178 of individual initiative, we can see the drawbacks of
654 individualism: the evictions made with no provision for
362 new homes, and later the monotony and the loneliness of modern farm life, the mutual distrust of employer and employee, and the general inability of farmers, as yet, to
423 co-operate. At the present, when planning, purchase and
476 sale are required on a large scale, particularly among small-
829 holders, the interest of each is still "the interest of the whole". The team-spirit must be recovered from the work (not simply the play) of school onwards to further education and communal effort.

175 To sum up, every farm-hamlet was held jointly and on
241 equal terms, each joint holder being responsible for an
427 equal share of the rent, and the movable run-rig system ensuring equal quality, as well as equal quantity, of land.
476 Common interest was assured, and there was mutual sup-
423 port in distress or sickness, as when one member, named in a deposition of 1718, was 'valetudinary'. Lastly, work was done in common not only when it led to efficiency

APPENDIX I

be high until 1948. The year 1947 was the peak year for the production of Harris Tweed, with over 5,000,000 yards (of which 3,765,000 yards were stamped, and some 1,500,000 unstamped). In 1948 the production of unstamped tweed had fallen to 500,000 yards but stamped tweed came to 4,380,000 yards.

Then, in the year 1948 the imposition of a 66⅔ per cent purchase tax struck the industry a crippling blow. The rise in prices of wool increased difficulties, and by 1950 few orders were being booked and men were being paid off. A few small men who had relatively large stocks frozen by the purchase tax were able to sell them off, but this minor compensation for losses was short-lived. The outlook is disquieting.

(ii) *Agriculture, Peat-making and House-building*, 1938

(a) *Agriculture.*—The estimated agricultural output shows a total value of £189,100, and of this total the quantity fed to animals was valued at £103,000. This leaves £86,100 as the estimated value of crop produce consumed on the Island. Adding this figure to the gross livestock output we arrive at a total valuation of the agricultural production of Lewis of approximately £194,100. To arrive at the average output per croft there was deducted the farm production, estimated at $\frac{1}{10}$ of the total by calculation from known crop and stock returns. This gives a figure for crofts alone of £184,400. By dividing by 3750, we obtain an average value of the gross annual production by crofters as £49, or say £50. The inclusion of squatters' produce would add so slightly to the total figure as hardly to affect the average for rural households. Outlays being small, most of this net output may be regarded as 'net earnings'.

(*b*) *Peat.*—To this sum must be added firing and some share in housing. The peat cut has been valued at £90,000, an average of £24 per croft; it demands much labour. As peat is freely cut by cottars and squatters, etc. (estimated at 1050 or so), the average value might be given as £19 per rural household. In Stornoway the chief fuel is coal.

(*c*) *House-building.*—From 1920 to 1940 the Department of

APPENDIX II

RECENT STATISTICS (1953–54)

In briefer form, the basic economic data can now be reviewed, in the same order, for 1953, or the period April 1953 to March 1954, as available. The results are shown on the second pair of Tables, pp. 318-319.

(i) *Tweed Industry* (1953–54)

Taking 5,000,000 yards as the 1953–54 total, and accepting an estimate of 1s. 2d. paid to weavers per finished, mill-shrunk yard, payments to weavers in Lewis-and-Harris (and a few in the southern Hebrides) would amount to some £291,700. After subtracting the output from Harris, this corresponds to an informal estimate by the Lewis Association for Lewis proper of well over £250,000 and more, probably £275,000 for the period. Adding the wages of spinners in Stornoway mills, and also of carriers, dockers, etc., it is thought safe to double the figure, with £550,000, for Lewis, rural and urban. Most of the weaving is rural. The increased use of daily bus transport allows rural dwellers to come to Stornoway daily to earn and so has increased the ratio of rural to urban wages by spinning and other labour. For rural carriers and mill-employees, a fifth of £275,000 is taken here, making £55,000. As no estimate for the 'net earnings' in Lewis is available, the same ratio to wages is taken as in 1938, making £1,200,000.

(ii) *Agriculture, Peat-making and House Building* (1953)

(a) *Agriculture.*—First, the trend of crop and stock production can be indicated by selected figures for the Island for 1918, 1939 and 1953. The areas both of oats and rotation grass increased, the three successive totals in acres being, for oats: 4460, 5020, 5440; and for rotation grass: 390, 1385,

178 for an average year (such as 1953) for Local Authority Housing,
362 we may allot half this to net output of local materials and to
647 wages earned by Lewismen, some £65,000, of which rural
63 wages were a small fraction, say £20,000.
435 For crofters and cottars, however, in 1953, a fairly typical
year, there was much local effort and achievement, by help
434 of 180 loans and grants from the Department of Agriculture
647 for Scotland, totalling £81,000 for new houses or house im-
654 provements (with a very few steadings). £80,000 may be
allotted to local materials and to labour paid or given by house-
426 holders themselves.

133 Over most of the parish the natural landscape is a series of low plateaux, generally below 250' O.D. around East Loch Roag, but rising westwards to an extensive platform with many summits around 500'-700'. Into this platform, towards its western edge, is inclised the narrow trough containing Little Loch Roag. Above it rise the deeply dissect mountains of North Harris and south west Uig, with many precipitous slopes reaching to 1,500' or more and summits to 1,885'. The discontinuity between plateau and mountain is particularly well displayed along the Atlantic coast, where it corresponds roughly wit the junction of granite and gneiss; an even more severe discontinuity, but formed entire in gneiss; is to be seen near the south end of Loch Langavat. Liuthaid (1,611' O.D.) rises more than 1,400' in less than a mile. The mountains, although lacking height, ar therefore spectacular in appearance. The low plateaux are far from featureless, too; their surfaces have been roughened and scraped bare by ice action and numerous hollows preserve shallow lochans and a few larger lakes. Occasional rocky hillocks rise 20'-1 above the plateaux; their abrupt discontinuity with the smooth surfaces is entirely comparable, though in miniature, with that of the mountains. They resemble nothing more than tropical inselberge and have no apparent structural explanation.

Unconsolidated superficial material, such as would provide sub-soil drainage and suitable raw material for soil formation, is rare. The characteristic surface almost everywhere is bare rock, often blanketed by peat at lower levels and on gentle slopes. Morainic material is most commonly preserved in hollows; peri-glacial conditions and,
135 more recently, heavy rainfall have swept clear most of the higher and steeper places. I the east and north east, e.g. around Loch Carloway, a sticky grey clay with large boulde is sometimes seen; the coarse gravelly drifts of south Uig have already been mentioned. It is impossible to make any useful generalisations regarding the characteristics and distribution of the boulder clays because their occurrence is so sporadic and exposures, beneath the peat blanket, are rare. Very occasionally, e.g. in Bernera, a finely bedde
[317 dull bluish or greenish grey clay is seen which is said to have been used for coarse pottery. This may be a lacustrine deposit of late glacial or early post glacial times or it might be a marine clay of the same period; there is however, no clear example of a raised beach in the area, which, were it present, might support the latter suggestion.
[317 Since our visit a lacustrine deposit of diatomite has been exploited on a small scale in Bernera.

Extensive deposits of fine white sand occur around Uig bay and in the Valtos-Kneep-Reef area; smaller deposits occur at Mangersta and Mealasta. Except at Cliff bay, Valtos, where it contains a high mineral content, the sand consists largely of finely broken shell debris. This blows readily and is found inland for half a mile or more and as high as 100' O.D., thus providing a natural surface dressing rich in lime. There are extensive machairs (sandy plains) at Kneep and Reef, and smaller ones at Uig bay, Mangersta, and Bosta (Bernera). Little cultivation takes place on the machairs nowaday

133 In the whole parish little soil, such as would be recognised by a lowland farmer, is to
134 be found. The most usual surface features are bare rock and blanket bog; arable land, h
407 meadows and improved pastures are generally made on peat, gathered together into long
[23] narrow beds - so-called "lazy beds" - separated by deep ditches. This expedient may mean that the use of tractors is impossible; since horses have almost disappeared, cultivation in such cases, if carried out at all, must now be by the spade alone. This is
133 the traditional method of lazy-bed work; it may be very productive in terms of yield per
134 square yard but it is pathetically unproductive in terms of man-hours. In some areas it
241 is clear that it has led to soil erosion. Even where the size and lay-out of the beds permits tractor work the tractor probably spends as much time manoeuvering into position and turning, as it does ploughing. In a few places, e.g. some of the East Loch Roag

.

It is worth noting that the rental charged for the newly cleared farm of Carnish was £55 - being £20 less than had been paid by the crofters. Thus it cannot be said that the latter were evicted purely in order to obtain more rent. The proprietor must have been taking a long term view, looking for land improvement rather than immediate gain. By the 1870's the farm rentals had increased by 55%, those of the crofting townships by only 15%. And the latter often remained unpaid.

Thus, whilst the farmers prospered, the tenants became crowded in their townships which were correspondingly less and less able to support their increasing numbers. The crofts became so reduced that in an average year the produce of the land might keep a crofter and his family for only six months; for the rest he had to find other means of support. Fortunately, after the hungry years of the 'forties', fishing provided just this. Starting in 1851, an annual migration began, first to Caithness and later to the whole east coast of Scotland and England. By the 1880's not only were most of the able-bodied young men following the herring as hired men on east coast boats, but many of the women-folk, who had learned gutting, packing and kippering from English girls brought to Stornoway for the purposes, were also earning. This was summer work, and fitted well between seed-time and harvest. In the winter, small local open boats worked long lines for white fish which were dried and salted for local curers as they still are today on the Norwegian coast. Between the 1850's and 1880's there was a "condition of plenty" in Lewis "which would not have been credited by those who judged of the condition of the people by the external aspect or sanitary arrangement of their dwellings".* It was this "condition of plenty" which encouraged the people to stay at home, to sub-divide their crofts, and to live on the proceeds of paid labour rather than on the produce of the croft.

Re-settlement, 1878-1935.

The process of sub-division ceased only when economic conditions became less favourable and emigration began to exceed natural increase. In the 1880's fishing and farming suddenly became less profitable. Simultaneously, and given extra point by the particular distress of the time, agitation for land reform, and in particular for the relief of the most congested districts, became a political issue. This began in Uig in 1874 when an attempt was made to evict 56 crofters from Bernera; hundreds of crofters resisted by force and subsequently marched on Stornoway. They were well received by the proprietors - who appear to have been unaware of the summary and inhumane behaviour of their chamberlain - and to the credit of all concerned the matter ended peacefully. But land agitation continued.

The position in Bernera was eased in 1878 when Linshader farm was deprived of the old township of Kirkibost which was resettled by crofters from Bosta, the latter being let to the Tobson crofters as an enlargement to their pasture. In 1880 new holdings were formed in Hacklete, which had been the grounds-officer's farm (but which, judging from its population, had always contained a number of cottars or sub-tenants). The grazing of Laimshader was probably returned to the Borroston crofters about 1886, having been part of Linshader farm and, in 1891, six new holdings were formed at Lundale, also part of the same farm. At the same period, under the new Act, the crofters of Crowlista, Valtos, and Kneep applied unsuccessfully for enlargements from the farms, but during the nineties the islands of Little Bernera and Eilean Kearstay were taken off Linshader farm and added to the townships of Bernera, and Valtos obtained Pabay Mor.

---

*Report....on the Condition of the Cottar population in the Lews. (C.5265), 1888, p.4.

175 427 Thus, towards the end of the nineteenth century, the proprietors were obliged, by pressure of population within, and of public opinion without, to made some concessions to their small tenantry. It may be relevant to point out that this was a period of falling agricultural prices and declining farm rentals; indeed the time was not far off when some farms would not find tenants at any rental:

TABLE 7

Farm:	Rental at c.1875/80	Rental at c.1885/90
Mealasta	£130	£85
Mangersta	£132	£95
Ardroil & Carnish	£285	£245
Timsgarry	£108	£80 (1)
Linshader	£349	£278 (2)

Notes: (1) Small reduction for enlargement to Glebe.
(2) £22 reduction for Laimeshader and Grimersta Lodge.

175 526 [161] [162] [231] 288 175 [653] The crofters of south Uig were in particular difficulty at this time for here fishing declined earlier than elsewhere but the townships remained greatly overcrowded. In 1910 Breanish and Islivig had 14 cottar families, (most of them sharing crofts with the official tenants), and three of squatters, i.e. on the common pasture. Here fishing had almost ceased and the people were almost entirely dependent on their crofts or on employment away from home. In Valtos and Kneep there were 21 cottar families; they had 31 cattle and sheep flocks. Here, too, fishing was on the decline. It was perhaps because of this that commercial weaving was developed in South Uig earlier than in most parts of Lewis. As early as 1900 Uig was classed with Harris, by the local committee of the Congested Districts Board, as producing a superior quality of tweed. Two 30 gallon iron pots were sent out so that enough wool could be dyed at one boiling to obviate irregular colouring in any one tweed. The C.D.B. also made grants for roads, footpaths and "marine works". Amongst the latter the pier at Valtos (1899) was an attempt to resuscitate local fishing, but it came too late.

175 653 175 657 427 [241] The Congested Districts Board was the first government agency with funds at its disposal to aid the crofting townships. One of its largest grants went in aid of the Carloway Road (or Pentland Road as it is now known). This scheme arose out of an abortive proposal for a railway from Loch Carloway to Stornoway. It was thought that this could enable trawlers and other large fishing boats to land their catch for quick transport to Stornoway and so to the mainland whilst the fishing vessels returned to sea with minimum delay. The road, an excellently engineered one, is still not properly surfaced. A more effective C.D.B. - aided scheme was the resettlement of crofters on Mangersta Farm, the rent of which had fallen to £70 and which the proprietors were willing to break up. Thirteen new buildings were formed here and the first harvest was taken by the new settlers in 1911. The crofters' rent was fixed at £73 and the C.D.B. paid £566 in grants to purchase the sheep stock and improvements, and towards the cost of fencing. About the same time the Board paid a grant to the township of Garenin for fencing a substantial enlargement to their pasture, obtained off Dalbeg. Here, and at Reef farm, smallholding resettlement schemes were vetoed by the Crofters Commission whose experts regarded the areas as unsuitable. Both have since been re-settled by crofters.

241 sists of the sporting estates of Grimersta, Scaliscro, Moregail and Uig Lodge, on some
311 of which a few cattle and sheep may be grazed, and a few small farms.

632 There are 37 crofting townships. In area they extend from 9,000 acres (Linshader)
311 to about 500 acres (Croir, excluding de facto shares in Bernera Shielings). The number
427 of crofter tenants ranged from 4 in Ungshadir and Earshadir to 61 in Breasclete, and the
162 average amount of land available to each crofter is 7.2 acres of inbye and 126 acres of common pasture (table 10). Averages are misleading. As the table shows, between districts the amount of land available per crofter varies from about 50 to 500 acres; as between townships the range is even wider (table 11). To some extent this contrast is the result of resettlement schemes which, in general, attempted to provide new holdings sufficient to yield a family living. The extent to which they were successful in this respect was limited by political pressure, especially in the 1920's, to provide the maximum number of holdings. Nevertheless the re-settled holdings have twice the average areas of both inbye and common pasture (13.3 against 7.2 acres, and 225 against 126 acres, respectively).

TABLE 10

Average acreage of land available for each holding and working unit.

241 233 311 427

CROFTING DISTRICTS:	INBYE LAND: Acres per holding	INBYE LAND: Acres per working unit	COMMON PASTURES: Acres per holding	COMMON PASTURES: Acres per working unit	NUMBER OF: Holdings	NUMBER OF: Working units

	7.2	9.0	126	157	699	580

NOTE: The distinction between "holdings" and "working units" is explained in the text.

427 Even amongst the old-established townships there is a tremendous range in amount of
632 land available per tenant, the southern districts being best placed and those in the north
311 worst, a situation which still remains. Indeed, the contrast in land available as between tenants (table 11) is a fundamental one; surprisingly, it is not on the whole reflected by a corresponding contrast in stock carried. Together with the rarity of effective fences between or within township pastures, the impossibility of properly hefting sheep to the hills when each crofter keeps his own little pack, and the excessive sheep/cattle ratio, this gives rise to serious problems which will be examined in Part III.

TABLE 11

Land Available by Numbers of Tenants

162 241 427 233 632

Acres:	INBYE LAND No. of tenants: (a) in whole parish: (a)	(b) in 'new' townships: (b)	Acres:	COMMON PASTURES No. of tenants: (a) in whole parish: (a)	(b) in 'new' townships: (b)

7.6-10	66	23	301-400	32	32
10.1-15	56	23	401-500	8	8
15.1-20	30	17			
20.1-50	29	24	940	10	10

Note: 'New' townships, for this purpose, are those settled since 1900.

361 In detail the arrangement of the townships varies. Certain features are common:
632 all inbye land and, consequently, all settlements, are coastal (except Lochganvich). Each has common pasture adjacent to the inbye and many have further areas of common - former shieling grazings - some distance inland (figure 1). This division of the hill grazings is to some extent nominal because fences are often absent or ineffective. Uninhabited islands, on the other hand, require no fences, and are particularly valuable for winter grazing; the smaller of them provide convenient natural paddocks for bulls
171 and tups when out of season. The management of all these common pastures is controlled by the township committees. Unfortunately the most important aspect of stock management - control of numbers and maintenance of a proper balance of sheep and cattle - is almost universally neglected.

233 The total stock which each croft may put on the common pastures - the 'soum' - is
427 defined in the Regulations. In the case of townships re-settled in the present century a
656 specific soum is placed on each croft but, in most other cases, the old practice persists of stating the soum in terms of rent. Thus the soum of each croft may be defined as 1 cow, 1 two-year-old and 8 sheep per pound sterling rent (this is a very common souming). Such soumings have been in existence since time immemorial; they are mentioned in 1836*. Many of the Uig townships had their soumings stated by the Land Court in 1912; in most cases the soum was given "per pound sterling of rent" (presumably 1912 rent), but in a few "per pound sterling of rent payable in 1886". The rents had been substantially reduced in 1891, thus 1912 and 1886 rents were very different. Any township has a certain limited, stock-carrying capacity; therefore, if the total rental is thus changed without

113 * New Statistical Account, Vol. XIV, p.148.

[TEXT CONTINUED ON PAGE 29]

233 change in area, then the amount of stock allowed, per pound sterling of rent, ought to be
427 changed, too.
656

This does not appear to have been done in Uig although in Stornoway parish the soum
175 per pound was increased after rents were reduced in the late nineteenth century. More recently, the Crofters Commission, in re-stating soumings for some townships, has generally (but not invariably) applied the soum to the 1886 rent, regardless of the wording of the 1912 regulations. This may appear to have the merit of consistency and, insofar as crofters pay any attention to the Regulations, it satisfies them because the greater (1886) rent gives them a larger soum and less likelihood of being criticised or penalised for overstocking. However, it perpetuates inconsistencies which originated during the nineteenth century when the stock allowed per pound sterling rent was not reduced although total rentals were increasing as squatters' and cottars' holdings were added (see page above). Moreover, the old souming referred to the old type of highland cattle which were much smaller beasts than those kept today, and it assumed that the shieling pastures would be in full use. A further complication arises because about 1920 some townships acquired substantial enlargements but the soumings do not appear to have been adjusted. Altogether it is little wonder that the Grazing Regulations are seldom observed, for they seldom bear any close relationship to the grazing capacity of township lands. Proper observance of carefully revised Regulations, in which unlimited substitution of sheep in place of cattle was specifically forbidden, would be of considerable benefit to the crofters.

241 The inbye, or croft, land is invariably separated from the common pasture by a ring
233 fence, the gates of which are generally closed for protection of crops from May to
417 November. Progressive townships are installing grids to obviate the twin nuisances of traffic interference and straying stock. The fencing of individual crofts was rare until the
178 1930's and is still by no means general. The inbye land is, in many townships, the best winter grazing and its division into innumerable tiny fenced patches, whilst advantageous for cultivation, would restrict the movement of stock in search of water and shelter; in a predominantly pastoral economy complete enclosure of individual holdings is not necessarily an advantage. This problem will be discussed in Part III but, in the present
184 context, it is relevant to point out that the small crofts of Lewis contrast strongly with the larger ones of, for example, the Uists and Tiree. Therefore, what may be advantageous in the latter may be retrograde in much of Lewis.

The lay-out of the crofts aggravates this problem. The long narrow strips of the 1850 lotting, well-suited to spade cultivation and common winter grazing, may require four or five times the length of fencing required by an equi-dimensional croft of similar area. If fenced the stock may be deprived of both water and shelter; since arable cultivation has become relatively unimportant a suitable solution to this problem might be to fence a small potato plot near the house and to put the rest of the inbye down to sown grass in three or four communal parks in which grazing could be properly controlled. A particular problem is posed by crofts which have been sub-divided. These may take the form of strips as much as half a mile long by 10 yards wide or, more commonly (and much worse), of piece-meal sharing of innumerable plots, a system known locally, but incorrectly, as 'run-rig'. This is seen at its height in Kneep (fig 22), where every croft in the township is affected. The problem does not arise in townships with large crofts, which are usually more nearly equi-dimensional. These are mostly the result of re-settlement schemes and have long been fenced, (see, for example, figure 15).

Crofter-tenants.

162 An analysis of crofter-tenants according to age, sex and occupation (table 12) provides
427 several important clues as to the present unsatisfactory state of crofting. More than
463 one-third of the tenants are over 65 years of age; a further 16% are absent, some of these may also be over 65, others are younger people working away from home, a few are tenants

162 of crofts in other districts, despite the legal requirement that a tenant shall reside w
427 two miles of his croft. Thus half the crofts in the parish are tenated by persons wh
463 cannot be expected to make the best use of them. This implies no criticism of the p concerned, it is a criticism of the system. Of 314 resident tenants under 65 years o age, 43 are women; of the men, 170 have regular employment including fishing or w 55 take casual or seasonal work as and when they can get it. Only 46, or 7% of all te are "full-time crofters" and, in fact, most of these are either invalids, disabled, or 60 years of age. Thus in Uig, unlike the southern Outer Hebrides, most crofts are best a spare time occupation, at worst merely a house site carying special privilege The table also demonstrates that the size of crofts has little bearing on occupational status; this is inevitable in a rigid system under which a man has no control of varyi the size of his holding according to his needs. Some young tenants inherit crofts far small for their family needs, whilst many elderly tenants, and women, have crofts w are too large for them to maintain.

241 It is not surprising, then, that many tenants do not wish, or are not able, properl
427 to cultivate or stock their crofts. A few, however, are particularly interested in agricultural production as a means of livelihood. Some of these have acquired extra crofts, and so built up much larger units. This may be done by acquiring tenancies in the crofter's own name or that of his wife or a close relative, or by sub-letting. 30 crofters in Uig are tenants of more than one holding, at least 20 work holdings hel the name of close relatives, and at least 120 have sub-let holdings. These figures a certainly too low; sub-letting without the consent of the proprietor or Crofters Comm is illegal. Nevertheless it is common, and it is generally unsatisfactory because the tenant has no security of tenure and no right to compensation for improvements; con- sequently sub-let crofts are often neglected and sometimes over-grazed as well. Co sub-letting, for a stated minimum period and with the right to compensation, would regularise a well established practice and encourage the formation of larger units, be able to support a family.

A converse of sub-letting is unofficial sub-division. There are a few cases of co usually relatives living in a second dwelling house on the croft - sharing the croft wit tenant; but this formerly widespread practice has all but disappeared. Such de facto "crofters" share the common grazings, as do "squatters" - persons with houses on th
162 common land - who keep stock. Thus neither the number of crofter-holdings on the
241 (699), nor that of crofter-tenants (660), is any guide to the effective number of potenti
427 agricultural units. Of the crofter-tenants, 100 are absent and some of those who are resident sub-let their crofts. After making these allowances the number of de facto holdings becomes 518; to these must be added 39 cottars, squatters and others (inclu a few tenants of council houses) who keep at least a cow or five sheep, and 23 agricult holdings without crofter status. Thus there are 580 potential agricultural units in Uig

233 That is not all. Of these 66 have no cattle, and 162 carry less than half their sou
241 of which 22 have no stock at all. Little more than 400 holdings can reasonably be sai
427 be agriculturally effective. This is an indictment, not of the crofters, but of the agricultural structure of the system. This neither provides viable holdings nor does enable those who wish to acquire enough land to be agriculturalists to get it, even thou much land lies unused or ill-used. In short, the system is too rigid. In consequenc de-population goes on apace whilst potential resources are neglected. Three-quarte a century of legislation and financial aid have, in the main, encouraged the developme crofts as homes for the elderly and as hobbies for those in other employment. Very reasonably, many crofters complain. But very few realise-or are willing to admit - the security of tenure and other privileges won in 1886, if too rigidly maintained, may ultimately bring about the decay of the very communities which they were intended to protect.

491
494 Brenish, at the end of the tarred road which also serves Islivig, is forty miles from Stornoway. On the thrice weekly bus the return fare to Stornoway was £1, and freight cost half-a-crown for a hundredweight, but because of competition from privately owned vans the bus service ceased in 1960. Mangersta is reached from the same road by about a mile of untarred side-road of indifferent quality; formerly the only access to it was by
362 a footpath over the sands to the south. General merchandise, fish and meat are supplied
205 by weekly vans; there are no shops. There is a post-office at Islivig; banking facilities
453 are supplied by a mobile bank.

311 The majority of the crofts are long narrow strips, with those in Mangersta being some-
427 what more compact. The area ranges from two to nine acres, with an average of about four acres; in Brenish and Islivick only about half is usually arable. All the crofts - or croft-units - are fenced, the work having been completed in Brenish in 1959. There are twenty-nine crofts in the rental for Brenish, ten for Islivick and thirteen for Mangersta; but, owing to amalgamations of various kinds the number of operative units is considerably less - fourteen in Brenish, five in Islivick and ten in Mangersta. There are no cottars.

134 As soils are reasonably good and comparatively free from rocky outcrops, the arable
407 patches are large enough to be cultivated with a horse or tractor. There is a tractor in
231 Brenish, and four horses, a horse in Mangersta and two in Islivick. All of these are hired for ploughing and carting peats. Very little work is done with the spade, unlike many of the other Uig townships.

233 While the general rhythm of township work through the year is similar to other areas, here the sheep are wintered up on the hills; some crofters winter lambs on their crofts. Brenish crofters are allowed to winter eight sheep, (or sixteen hogge, or four year-old heifers), on Mealasta Island - hogge are usually sent since their loss, by falling over the cliffs, is less serious than the loss of heifers. Eilean Molach is used by Mangersta crofters, who are allowed two sheep each in summer.

241 The only crops grown are potatoes and oats, with "black oats" (Avena strigosa) on the sandy soils in Mangersta. Since seed for "black oats" is unobtainable commercially, the crofters save their own. A grass mixture is sown by the majority of crofters for hay, to qualify for the subsidy.

233 The extensive hill and mountain pastures are not separately fenced; sheep from all three townships graze over all. If the total sheep stock of the townships (about 3,300) is compared with the souming figures it is found to exceed the soum by about 50%. On the other hand, fewer cattle and horses are kept than formerly so that taking the total stock for all animals (horses, cattle and sheep) and comparing with the actual stock now carried, the area carries only 87% of the stock which the soum allowed. In the two older townships the souming was reckoned according to rent, being one cow, one two-year old and eight sheep for each £1. In Mangersta, however, the soum was one horse, three cows, one heifer, two stirks and twenty-five sheep for each croft.

Lambing percentage is about 80, and ewes form about 60% of the total sheep numbers
236 (excluding lambs). In this district some wedders are kept for three years and then sold
435 for meat, but the main income is from wool, about three pounds weight from each sheep, which sells at up to four shillings a pound.

231 Most crofters keep one or two cows, and the calves are normally sold in the autumn or spring sales. Brenish and Mangersta each have a bull, and in the three townships there are sixty-seven cattle and thirty calves. Shielings, formerly used for about seven weeks in

231 summer, were last used for cattle six to eight years ago by people in Brenish, but none are in use today. These shielings were at the western foot of Mealieval, only about a mile from the township. The Brenish 'distant' shellings, about six miles to the south-east of the township across the mountains, were not used after about 1920, while the adjoining Islivig shellings were last used in 1922. Mangersta may have had its original shielings to the east of Loch Melavat about a mile south of the township, but after obtaining the enlargement from Mealasta farm, until about 1939, shellings were used in that area.

314 No peats are cut on the crofts; the peat-cutting areas for all three townships are near the road and in no case far from the township. The common pasture near the crofts beare
241 evidence of former cultivation, but it is at least fifty years ago since crops were grown on it. At this time the townships of Islivig and Brenish were over-populated with many cottars living on the crofts and all possible land on the crofts was already under cultivation. Today, less than half this 'old arable' is being cultivated, and in several cases the land is used solely for hay and grazing.

342 There are now no thatched houses inhabited in the townships and most houses have kitchen and other extensions added. Some crofters have built concrete two-storey byres
312 of modern design. In Brenish, where the hills to the east provide a good catchment area and the Brenish river a good source of supply, all the crofts have their own private piped water supplies, while in Islivig and Mangersta most crofts now have, or are getting, a
377 water supply. All croft houses are supplied with electricity from the grid.

226 Commercial fishing has long ceased and as there are only three boats there is now very
301 little fishing for domestic use, the principal use of the boats being to ferry sheep to the off-shore islands. Weaving is an important occupation. There are seventeen weavers -
286 nine in Brenish, two in Islivig and six in Mangersta, and during 1959 they were kept busy;
461 in 1958, however, few orders were received. Weaving cannot be said to bring in a steady
434 income here, and some of the weavers, and others, find additional employment outside the township - this includes four men at the hydro-electric scheme at Gisla, three at Mangersta Ministry of Civil Aviation station, three at Aird R.A.F. station and at least
407 one in the Glen Valtos quarries. In addition, one man owns at tractor which he hires
495 out, and one, owning a lorry and van, does haulage work. Altogether, out of a total of twenty-seven men under sixty-five who do work, all but three (one just out of school and one a semi-invalid) have other employment in addition to their crofts.

162 The total population for the three townships is one hundred and twenty-one residents, and fourteen permanently away from home. Of the residents, twenty-eight (or 23%) are children of, or below, school age, forty-seven (39%) are in the 15 - 45 age group, 15 (12%) are in the 45 - 65 age group, and 31 (26%) are over 65. Of the resident tenants, thirteen are over 65, twelve under 45, and five between 45 and 65.

181 The relatively young population may help to account, together with the better soils, for this area giving an impression of a fairly prosperous crofting district compared with some of the others in Uig. Amalgamation of crofts into larger units has also gone further. The use of a tractor or horse for ploughing, extensive use of artificial fertilisers, the sowing of grass seeds and the sale of sheep for meat, all seem evidence of a group of people who are determined to make the most of their limited resources.

233 One enterprise, that of the Aird Bheag sheep farm, deserves special mention. Four crofters (three from Brenish and one from Islivig) have purchased from the Uig shooting estate about 2,000 acres of land on the Aird Bheag and Aird Moire peninsulas, five miles south of Mealasta. Here they are running a flock of about five hundred sheep. There is

142 The circular, corbelled stone "beehive" huts, some still in good repair, are of uncertain date. The best preserved are on the Morsgail Deer Forest, in remote situations which make it almost certain that they were only occupied seasonally; those on the Garynahine common pasture are associated with assymmetrically ridged, curving, lazybeds. This, however, need not imply permanent occupation of the site, nor does it solve the problem of age; such lazy-beds are certainly old, possibly pre-potato (c.1790 here) - but the huts do not decay with age and may be very much older.

195 42 [64] Early in the eighteenth century the present area of the parish of Uig was held from the Seaforth clan chief by 26 tacksmen, whose names are recorded in the judicial-rental of 1718, (Fig.4). They, presumably, had sub-tenants but of these there is no record. Elsewhere in Lewis the same rental records many small tenants holding direct off the chief but in Uig, apparently, the tacksman and sub-tenant system remained intact. Although we cannot be certain of their precise extent, the distribution of the tacks coincides fairly well with that of the better agricultural ground (Fig.2). 241 Five of them cluster round Uig bay, four were in the Valtos-Reef area, and three around the strait of Little Bernera. All these districts have machair; together they accounted for three quarters of the meal and more than half the sheep and money rents. What is more, these rents represented 27% of the total rental of Lewis, whereas by 1887 Uig yielded only 17% 178 of the rental and by 1901 the proportion was reduced to 14%. The relative decline of 369 Uig is largely due to the growth of Stornoway; this shift in the centre of gravity of Lewis has tended to exaggerate the remoteness and isolation of Uig in the present century.

161 175 [172] 407 [494] 000 By the end of the eighteenth century the tacksmen seem to have disappeared; at any rate they are not mentioned in the remarkably detailed account of the parish given in the Old Statistical Account, 1792. Meanwhile the small tenants had multiplied: whereas in 1755 the old parish * had supported 1,312 persons, in 1792 the minister recorded 1,898. At this time there was neither plough nor cart in the parish. The minister was cultivating potatoes and his family were eating them

TABLE 3

AVERAGE STOCK HELD BY EACH FAMILY

	1792	1959
Cattle and calves	9.2	2.1
Sheep	13	37
Horses	1.8	-
Goats	0.8	-
No. of families	387	450

Note: the figures for both dates refer to the area of the old parish.

* The old parish of Uig excluded the Loch Carloway district, from Kirivick north; this area lay in Lochs parish until 1891. Unless the old parish is specified figures quoted have been corrected to conform with the modern boundaries.

1. [See p. 2--Analyst]

33 townships and at Islivig and Breanish, the peat is thin (or has been stripped) to reveal a
34 gravelly dirft,[1] free-draining on suitable slopes. In such places a black loamy soil has
been developed by cultivation; the many ditches of lazybed cultivation are not necessary
and, if the area is large enough, it can be worked by tractor. Such soils, in the climate
of west Lewis, are eminently suitable for rotation grass, for hay or pasture, and much
more could be done with them under knowledgeable management. Where shell sand has
been blown inland on to peaty soils the natural top-dressing has had a remarkable
ameliorating effect on texture and acidity. Such areas are all too limited, the most
important are at Valtos, Kneep and Reef, and around Uig bay; smaller areas are at
34 Mealasta, Mangersta and Bosta (Bernera). The hill grazings are dominated by a thin
heather cover, blue moor grass and, in wetter places, sphagnum and cotton grass. Sin
35 the cattle population has been declining many older residents claim that the pastures,
particularly near the townships, have deteriorated, the proportion of grass declining and
coarse heather increasing. "The hills that were green when I was a boy", said one, "ar
now black". Neglected arable and pasture land, too, soon reverts. Rushes and flags
invade the ditches between the old lazy beds and, if the ground is at all waterlogged, soo
invade the beds as well. Drier ground, if not well grazed, soon reverts to heather. Th
limited machairs are little better; almost devoid of humus, they show little development
of soil profile, only a thin grey layer of turf roots; rabbits, or injudicious cultivation
readily set off wind erosion. Only where the wind has provided a natural blend of peat
and machair are conditions better. Such areas are very limited.

32 The climate is in many respects severe; no local statistics are available, but some
for Stornoway and Benbecula are appended. The frequency of high winds has a bad effec
on both vegetation and stock, but to some extent wind counteracts excessive moisture.
Near sea-level, where all the townships are situated, frost and snow are almost unknown
Thus it is exposure to the wind that limits the outwintering of stock, not low temperature
this suggests that if pastures could be improved in suitably sheltered places far more
advantage might be taken of the relatively mild winter temperatures. It is believed that
the sunshine record is particularly poor in the south, where clouds can frequently be
seen hanging over the mountains when the sun is shining on Bernera and the area north
36 east of East Loch Roag. The relatively dry and sunny period which commonly occurs in
May and June ought to make for a good hay harvest; unfortunately the natural meadows,
such as they are, are late starters, and the custom is to cut the grass when it has gone to
seed. Thus hay is often being taken in September - one of the wettest months in the year

CHAPTER TWO

SOME HISTORICAL ASPECTS

2 Evidence of pre-historic and other early settlements in the parish is afforded by the
occurence of standing stones, brochs and duns. The Callanish circle and its satellites
are by far the most remarkable ancient monument in the Hebrides, and testify to the
former importance of the site even though today their precise significance may not be
clear. Most of the duns are now little more than circular heaps of stones, but in that at
Doune Carloway the double walls still stand to a considerable height. A later phase of
settlement is recorded in the place names, a very large proportion of which contain Norse
elements such as -nish, -vick, -bost and -shader; it seems probable that most of the
present township sites have been more or less continuously occupied since Norse times.

ARDROIL CARNISH and TIMSGARRY - lay-out of crofts formed from farms in 1921. Compare fig. 14.

/facing p. 37/

361 Many of the original houses are ruined or used as byres. Figure 14 shows that new
491 houses have been built near the sites of the old ones but sometimes nearer the road - all
[487 but four houses have easy access to the road. Crowlista is linked to the main road by
499 two miles of rough gravel side-road, and by a footpath and ford via Timsgarry. Vans call
205 but there is no Post Office, store nor bus service. At present water supplies are poor -
366 two wells only are in use.
494
312]

Carnish is served by a short unmetalled road and all houses have good access to this. W
supply is good; water may be stored on the high part of the crofts and piped into the houses
The roads serving Timsgarry too, are unmetalled, but the main road is less than a mile
away. This 'main road' from western Uig to Stornoway runs through Ardroil and all
[366 except one of the houses not near to it have good drives suitable for lorries. Ardroil has
205 a store and Timsgarry a Post Office. One butcher's and two grocers' vans call weekly
453 and the travelling bank fortnightly. The thrice-weekly bus service to Stornoway (return
494 fare almost £1) ceased in 1960 because of competition from privately owned vans and cars.

241 The cultivated land is in strips usually large enough for horse or tractor work; the
[23] smaller potato patches are hand dug. Few horses are kept now, Timsgarry, Ardroil, and
407 Carnish have one each and Crowlista none. Crofters hire these horses or tractors from
Brenish or Enaclete. Oats and potatoes are the only crops grown in quantity, small
patches of turnips are found and most crofters grow root vegetables. Kale was seen growing on one Ardroil croft; this was an experiment and seemed to be very successful. Bere and rye are no longer grown. Grass mixtures are sown in order to qualify for cultivation grants. Oats are undersown, or grass seed may be sown after the oat harvest, and left for hay for several years - some sown twelve years age was said still to be giving very good hay, but on the whole very little grass is sown in Crowlista. The acreage of natural grass cut for hay varies a good deal with the weather and the time and labour available. Crofters find this difficult to estimate as well, as often small irregularly shaped pieces are cut, and the figures, therefore, may not be accurate. (Appendix A).

One excellent garden showed that a rich variety of vegetables, fruit and flowers can be grown if adequate shelter is provided and the time for cultivation is available, but few crofters have the necessary knowledge or interest.

242 Lime, dung and artificial manure are widely used, though on some Crowlista crofts
[134 the compound fertilisers were in use for the first time in 1959. Shell sand is used on the
324 crofts which have peaty soil. Although it is agreed that seaweed and dung are the ideal
fertilisers for potatoes, seaweed is only occasionally used. It is becoming difficult to obtain locally and much heavy work is involved.

231 Each of the thirty-five operative units which carry any stock at all has a cow for domestic milk supply and manure. If the family is large or many visiting relations stay on the croft during the summer the calf has to be sold early; otherwise it will be reared until the cattle sales in September or May. Only eight crofters had two cows; fifty years ago four were commonly kept. Only thirteen of the units had young cattle other than calves. One crofter was rearing a kid for milk.

The bull supplied for these townships and Mangersta is an Aberdeen Angus which is wintered on the Ardroil machair.

233 It was sometimes difficult to obtain factual information about sheep and it is difficult
to generalise. Operative units without sheep were those where no suitable labour was available. In a few cases crofters considered that sheep were 'not worth the trouble' - but others were building up their sheep stocks. Individual flocks ranged from ten to two

233 hundred and thirteen - but most crofters had from forty-five to one hundred and twenty. Wedders are sold at two-three years old when the mutton is said to be at its best.

231 Parts of the common pasture - usually the machair, are set aside for wintering hogg
but the usual practice is to keep as many as possible on the croft. The soum as a whol
[427] is not enforced but shares in the wintering parks are adhered to. For example:- Tims
Glebe is leased to Crowlista and one share entitles a crofter to winter twenty-five hoggs
on it. In Ardroil one share allows one cow or four yearlings or eight sheep or eight ho
[232] on the machair - in practice it is the best hoggs that are sent. The minister at Timsga
who is much interested in sheep husbandry, has bred a heavier sheep with longer legs b
crossing the Hebridean blackface with Swaledales and these seem to be doing very well;
the minister is more attentive to his sheep than are many of the crofters, but some loca
crofters are showing interest in this crossbreed. The lambing percentage, so dependa
upon the winter and spring weather, was about 80% in 1959 and this was regarded as goo

Enquiries show that some crofts in each township far exceed their souming but because others carry no stock the four townships are understocked according to the total soum, here expressed in cow units. Sheep stocks in Timsgarry approximate to the she soum, Crowlista is overstocked by 130%, while the other townships are understocked.
[233] Some of the figures used for sheep stock were approximate or estimated. Nearly all cr keep some poultry and surplus eggs may be sold to the grocery vans.

The rhythm of work on the croft during the year is shown on Figure 16, overleaf.[1]

241 Part of the hill common west of Crowlista was cultivated until the beginning of the
175 present century, at which time the township was overcrowded with two or three houses o
[361] each croft. A similar area west of Carnish was cultivated and old lazy beds, now graze are to be seen on slopes south of the road in Ardroil, in the valleys of Amhuinn Thoragha and Allt a'Gharaidh and on the Borranish peninsula. The ruined shieling huts for this a still to be seen around and beyond Loch Suainaval were in use until 1934 - '35. (Figure 5).

464 Ancillary employment is sought by all but nine of the thirty men under sixty-five in
these townships and the wives of two of the 'full-time crofters' have regular employment.
228 There is no commerical fishing by local boats though the Bernera lobster boats are seen frequently off Uig Bay. The ruined curing house and piers at Crowlista, and the 'port' shown on the O.S. map near the site of the clachan in Carnish, point to the former importance of fishing.

288 At present the weaving of Harris tweed from yarn supplied by the Stornoway mills is more lucrative. There are two looms (plus one other weaver) in Carnish, two in Ardroi three in Timsgarry and two (plus one other weaver) in Crowlista. All these looms were in use and two tweeds woven a week bring in a useful income but the supply of weaving is irregular. The future security of these weavers depends on the prosperity of the Harris tweed industry.

464 Mitchels's sand and gravel quarry at Carnish provides employment for from three to
316 ten men. Five men from Ardroil and one from Carnish are employed there at present.
712 The Aird R.A.F. station draws most of its civilian employees from Aird Uig but two
377 Ardroil men work there. One Crowlista man is employed at the hydro-electric shceme
[426] site at Gisla and this work will last for another year or two. Employers recognise the particular needs of their crofter employees and 'days off' are allowed for sheep fanks and other necessary work.

* The minister's ewes gave 103%.

/facing p. 44/

427 Tables 16 and 18 support the definition of a croft as a small livestock-economy unit,
311 primarily concerned with the provision of milk for the family and young cattle and wool for
sale. There are no cash sales of crops - the whole of the land-use is directed towards
231 the subsistence of the crofter and his stock. The cereals (almost entirely oats) and the
[241] hay (occupying a very small proportion of land for a livestock farming region) are grown
for winter fodder for the cattle and sheep. The larger part of the croft is given over to
[246] grazing - usually of poor to medium quality - which receives very little attention from the
crofter. Less than one third of the holdings have sown grassland (and in these few cases
it is normally less than half an acre) - a fact which suggests a passive rather than active
attitude of the crofter towards his land.

[244] In addition, every croft has its own small potato plot - rarely more than half an acre
to provide for family needs, and most crofts (58%) possess a vegetable garden - again for
house use.

[435] Nearly all the crofts carry one or two cows - the second cow ensures a milk supply all
the year round. Young stock are sold at one year to eighteen months old, rather than as
calves - a result of the incentive offered by the calf-rearing subsidy. The milking stock
is replaced very infrequently.

427 Where one croft differs from the next is in the numbers of sheep stock. Table 17
233 shows an even distribution of crofts with more than fifty and less than fifty sheep; but, in
[434] fact, over one third of all crofts have less than twenty-five sheep. Sheep are the only
source of money income on the croft, except for the annual sale of the calf, and subsidies,
and there is a considerable difference in the size of sheep stock between the truly subsis-
tence and "retirement" crofts on the one hand and the "commercial" crofts on the other.
Hence the souming figures, and here note the contrast between Valtos with the sheep stock
equal to 111% of the soum and Kneep - 353%!

∞ An attempt has been made in Figs 19 and 20 to relate the size of the stock carried on

TABLE 18

Sown grass (hay)	5.5	1.0	5.5
natural hay	3.5	10.0	4.0
natural grazing	75.5	76.0	75.0

427 633 311 Joint tenants of one have moved to Geshader while continuing to work the Ungshader land. Another is preparing to move to Enaclete and yet another lives on a feu at Loch Chroistean Cottage. At present, three working units remain. Enaclete consists of nine crofts with ten units, one being rented by joint tenants.

221 The rhythm of work is similar to that in other parts of western Uig. Potatoes and oats are planted in April followed by lambing and peat cutting in May. In June and July the sheep are shorn and subsequently sent to the common grazings. In August the peats are carted, once they are dry, by lorry direct to the crofts. Hay-making follows. The lambs are weaned in September, harvest is then carried in and tupping and statutory dipping take place in November. The sheep are then returned to the township grazing though the lambs 241 may be fed with hay on the croft. There is little regular crop rotation and only a small number of crofters seem to undersow oats, thus improving the quality of future hay crops. Gardens are not important and only provide for family needs but Caryshader particularly has a number, some growing flowers as well as vegetables. Fertilisers vary widely from croft to croft as well township to township. Enaclete potatoes are still grown near the shore and thrive on seaweed; those of Caryshader are usually fed on artificials.

231 Most crofters keep one milk cow with a calf; a few rear a young beast for the autumn sales in Caryshader. However, some now rely on their neighbours for milk in return for grazing and one croft has turned to goats, as giving less trouble. The bull for the whole district is a beef shorthorn and is kept on Geshader -Ungshader common grazing as it is completely fenced; and Geshader is responsible for its upkeep.

233 Lambing seems to have been generally good in 1959 but it was not easy to get exact figures. The Morsgail Estate and Gisla farm also run considerable flocks. The common pastures total 3,119 acres with an enlargement, formerly used as shielings, of 1,215 acres for Enaclete, Geshader and Ungshader near Loch Suainaval, and for Caryshader 88 acres [314] on Floday island. The shielings have been disused since the war. Peat is normally cut to the west of the road but at least one elderly tenant in Geshader has kept a section of his croft for this purpose to save the effort of working further afield.

241 178 231 Generally speaking the land now cropped only represents one third to one half of that worked by spade 20 - 50 years ago when the crofting population was larger and when much greater numbers of cattle were kept through the winter, thus requiring more potatoes and more oats. The cattle numbers are much less than the total souming but sheep are in excess. In Enaclete, at least, overgrazing by sheep has caused a decline in grazing quality.

464 Clearly in these townships, apart from the very few crofts still fully cultivated, the means of livelihood is sought elsewhere. At present there are altogether fifty-three men in the working age group (15 - 64) in all four townships. Of these fourteen are away, nine permanently and five periodically. Thirty have regular or periodic employment besides crofting and of these seven work at Gisla on the hydro-electric scheme, seven weave, some of them part-time, four hire out vans, two do post-office work and others have varied occupations while only three are full-time crofters. At present there are few men in the Merchant Navy and fishing does not provide an occupation although many share rowing-boats in their spare time, and fish for domestic use.

162 [164] The population as a whole is ageing and of the group between 15 and 64, forty-four (roughly 30%) work away permanently or have emigrated. It is noticeable that there are few crofts worked by people with young families

000 In conclusion it may be re-emphasised that the fate of the crofting townships depends more

Notes:

(a) The total areas of common and inbye land for each township are given in the text.

(b) Soumings have been calculated according to the rent operative at the date when the grazing regulations were first made unless some other rent is specifically quoted in the regulations.

(c) The sheep totals are known to be incomplete but the proportions (ewes/lambs/others) are as reported (see Appendix A (2)).

(d) Where there is a specific sum for a horse this has been added, (half to the cattle sum and half to the sheep sum) after allowing for any horses actually present.

(e) Where there is a sum for two-year old cattle this has been included in the cattle sums at the rate of 2 two-year olds to one cow.

55

As yet the tourist trade is almost entirely restricted to visiting relations but many houses offer suitable accommodation for people who would appreciate quiet holidays in these very beautiful surroundings. The distance from Stornoway, the difficulty of obtaining varied food supplies - and the weather - were cited as disadvantages! Passengers on a weekly coach tour from Stornoway are supplied with meals at an Ardroil house which has good access to the beach but otherwise the crofters show little interest in the possibilities of tourism.

In common with other crofting townships, the greatest problem here is that of an ageing population because the younger people seek employment outside their township. The diagrams[1] illustrate the age-heavy structure of the permanent resident group and also the numbers of the insurable population periodically or permanently away. The lack of suitable work, for young women particularly, is also shown. The ages of the tenants also illustrate this problem. Of the thirty-seven tenants here, twenty or 34% are over sixty-five. Serious, too, is the loss by emigration of people between fifteen and sixty-five. Of the total 'working population', 35% have left this region since 1939. The corresponding figure for Crowlista alone, the older settlement with smaller crofts, is as high as 42%.

We found in this part of Uig some crofts efficiently and energetically worked by young tenants, and if reasonable stock prices are obtained the larger crofts can be worked profitably. However no croft will fully support a family; ancillary employment is always sought by crofters with growing families yet many crofts are carrying less stock than they might because some tenants are not interested in, or able for, agriculture. The croft is increasingly thought of as a home, as part-time employment - often for older members of the family - and as a place for retirement.

It is easy to list schemes for improvement and change:- dairying to supply Stornoway with milk, poultry and pig keeping on a commercial scale, cultivation under glass, the tourist industry, forestry on a small scale, lobster and crab fishing, etc. Such schemes would require capital not available in the townships, careful planning, and tactful administration by people with real knowledge of this area and its people. Meanwhile even the potential production of the crofts is by no means realised.

CHAPTER SIX

AIRD

by

Madge Phillips.

The little township of Aird is an isolated and old-established crofting settlement along the western side of the steep and narrow valley of the Amhuinn Gil na h-Airde three miles north of Crowlista. After leaving Loch Meacheit, the river flows northward through a gorge (at the mouth of which are the ruins of the old corn-mill), then across a narrow flood-plain into the rocky bay of Camus na h-Airde. The crofts, roughly fan-shaped in arrangement and varying in size from 3½ to 7 acres, each originally included a narrow strip of the flood-plain, stretching across from just beyond the right bank of the river, up the steep, rocky slope above the left bank and widening out over the more gently slopes between the 100 ft. and 200 ft. contours. A number of the crofts were subsequently enlarged, gaining extra land on the right bank of the stream, whilst others received additional ground to the north or south.

1. [See figures 12 (facing p.34) and 17 (facing p.39)--Analyst]

133 The 1,700 acres of common pasture stretch to the east and west of the crofts, across
[231] the peninsula which terminates in Gallan Head, extending to those of Crowlista and Valtos
in the south. The whole coast is broken and rocky, the land inland is peaty, and Aird
654 lacks the advantages of the machair land found further west. To the north of the village
there is now an R. A. F. radar station on Rudha Caol, built on what was part of the common
pasture. It dominates the landscape and makes a considerable difference to the life of the
inhabitants.

361 The township, though isolated, is reached by a good road which leaves the main road
[497] at the western end of Glen Valtos. Grocery vans call on Wednesday and Friday, a
[443] butcher's van on Saturday, and the local people are also allowed to shop at the N. A. A. F. I.
within the Camp. The road through the village approximately follows the line of the 100
ft. contour and all the houses are built directly on to the road, with byres, weaving sheds
and other buildings behind, whilst in most cases hens are kept on the steeper slopes below
[205] the road. Thus the settlement has far more of the appearance of an English village than
[342] have most crofting townships, but there is no shop or post office. The majority of the
houses are stone with slate roofs and fairly large, though some of them have been built for
[354] more than fifty years. All have electric light and their own water supply and several have
[312] modern byres.

427 There are ten crofts, as the enlargement of one of the original nine was subsequently
311 split off to make a separate croft. Of these, one tenant is an absentee and another an
elderly woman who does no cultivation. In both these cases, grazing is let to others so
[49] that there are actually eight operative units. The crofts are fenced in their upper portions,
but in most cases the fencing does not extend down to the river and there is free access to
the single concrete footbridge which spans the stream.

241 The only crops now grown are oats and potatoes and a few vegetables, with some sown
grass; natural grass provides most of the hay crop. Lime and shell sand and artificial
fertilisers are used; the two former particularly on the ground near the river where the
cultivation is in narrow strips separated by drainage ditches and ploughing is done by horse.
[407] Most of the cultivated land is on the gentler slopes behind the houses, where the use of a
[24] tractor is possible. Before 1914 most of the land within the original turf dyke was culti-
[824] vated; bere was grown and ground at the mill for meal for barley bread. Seaweed was
[231] extensively used as a fertiliser and most of the families kept eight or nine cows, so that
there was a more plentiful supply of manure. Now, six of the families each keep one cow
for domestic milk supply (two of the others each keep a goat). The township possesses
no bull, but make use of those at Valtos or Ardroil.

233 On the other hand, the sheep soum is generally exceeded; instead of the entitlement
of about 200, the total flocks grazed on the township pastures are approximately 500. The
lambs are weaned early in August and put on Rudha Caol (Air Force use has not prevented
this) and weddors are usually sold at the age of two or three years in Stornoway - many
in October to reduce the numbers that must be pastured during the winter.

162 The total resident population of Aird consists of fifteen males and sixteen females.
Of these, twelve are over 65, six are aged 45 - 64, 11 are in the 15 - 44 age-group (there
are only three married couples) and there are two children under 15. Nevertheless, most
of them are complete families; only one person lives alone; no members are reported as
[166] periodically working away, no men and only two women are permanently away. Neither
has there been much emigration since 1939 - five women only have married out of the
parish. The tenants of seven of the crofts are over the age of 65, the only one in the 15 -
44 age-group is a new-comer to the district and does little croft work.

Uig

The area under cultivation has contracted in the past twenty years. Before 1939 most crofts had about twice as much land under cultivation and at Valtos some were cultivating small patches outside the township fence. The cultivation of the common machair at Cliff ceased in 1939. The land had been "too long in labour" (potatoes had been planted on the same ground for nearly one hundred years), and the soil had been affected by over-liberal applications of sulphate of ammonia which replaced the traditional soot-impregnated thatch from the black-houses. Moreover the Cliff machair was particularly vulnerable to "blow-outs" after ploughing. Cultivation of the Kneep common arable has all but ceased, and the fifty-two acres of arable machair in the township of Reef have been untouched since the 1930s. It is noticeable that the common machair cultivation and the shieling economy ended about the same time. Smaller numbers of better-quality cattle were needed to meet the daily milk requirements of the croft; a much smaller area of cultivation was therefore needed to provide winter fodder and consequently more land was available on the croft for potato cultivation. Consequently the more distant machair was replaced by cultivation within the croft.

Contraction and decline of the economy is common to all three townships, but the form and cause of this decline is different for each, and where the township consists of two separate settlement nuclei there is frequently a difference between the two parts:

The township of Valtos is in two distinct parts: crofts 1 - 34 are a succession of narrow strips about ½ mile in length stretching from the shore to about 200' O.D.. The boundaries of the outer crofts (nos. 1 and 34) if projected to a point on Pabay, form an angle of 45°, so that the crofts are narrower at the shore (40 - 70') than at the upper limit (100 - 180'). Of these 34 crofts, 19 are in so-called runrig, eight in pairs and one group of three. (Fig. 21). Cultivation is carried out on numerous intermixed small patches, held permanently; the grazings are interchanged at the year end. Fragmentation imposes a severe limitation on the economic efficiency of the croft. None of the crofts at Valtos is individually fenced though some groups of two or three are fenced together. With the contraction of cultivation only the less steep areas are cultivated, to facilitate ploughing.[1] As a result, the bulk of the cultivated plots are to be found at either end of the croft - near the shore and on the hill top against the township fence.

The remaining five crofts of Valtos, and a squatter, are at Cliff in the valley separating the Valtos peninsula from that of Aird. Here the crofts are fenced, more compact and slightly larger (4.8 acres as against 3.8 acres) and they occupy more level terrain than those in Valtos. Two of the crofts are worked in runrig - these being situated on the machair. The houses are set back about a hundred yards from the road, along the western township fence.

Kneep township is again in two parts: Crofts 16 - 18 together with the Manse and two cottars, are situated across the neck of the Glebe promontory, on the south side of the peninsula. The five legal crofts are today worked as three units, fenced, reasonably compact and with holdings of exceptional size for the area - average 15.1 acres. Crofts 1 - 15 at Kneep on the northern side of the peninsula adjoin those of Valtos. Here is a climax of land fragmentation, which imposes severe limits upon croft efficiency. Twelve of the fifteen crofts are worked; of these only numbers 4 and 5 are compact homogenous crofts; numbers 3 and 6 are compact except that part of the land which lies within their boundaries belongs to croft no. 13. The remaining eight crofts comprise a hundred and eight separate plots of croftland and fifty-two separate plots on the common machair. One croft with 2.8 acres arable the average size of each piece is a mere 0.15 acres! The grazing land on the croft is divided into strips running across the slope, which are interchanged each year, whilst a large part of the common grazing lands are divided into

1. Pre-1939 much of Valtos was cultivated in lazy beds - by spade. Today 9% is cultivated by spade; 43% by horse plough + 48% by tractor.

strips running across the slope, which are interchanged each year, whilst a large part of the common grazing lands are divided into interchangeable sections ("quarters") to accommodate each of the groups of crofts. See Figures 22 and 23.

The cultivable croftland at Kneep is relatively flat and the natural drainage is poorly developed; the quality of this land, depends to a very great extent on the upkeep of a dyke running across the croftland from a small marshy loch to the sea. This dyke has not been cleaned for several years, and as a result a large area has been invaded by reeds. Other parts of the croftland have been similarly overrun by 'wild rhubarb'. Such deterioration is almost inevitable when land is so fragmented.

The crofts at Reef are grouped in three separate localities. Crofts 1, 2 and 3, on the edge of the machair have probably never been occupied since the crofts were allotted in 1921 and are now used only for grazing. The main body of the crofts (nos. 3 - 13) face south - they are more compact than those in Valtos and Reef, but they vary in size from 2.9 to 13.25 acres and their boundaries are irregular in shape. Two crofts (14 and 15) are separated from the main parts of Reef: they are both small (2.5 acres) but the size is compensated by their situation on the level terrain of the machair. The old farm house is used as the dwelling for both 14 and 15. Much of the cultivation at Reef, except on the machair crofts, is on lazy beds - but many of these have decayed with the advent of horse and tractor ploughing; 35% of the land is cultivated by spade, and the remainder by horse plough.

The crofting economy is probably at its lowest ebb in Reef. Only eight of the fifteen crofts are occupied and of these five are worked by disabled crofters or crofters over sixty-five. The Reef crofts were settled in 1921 by returning ex-servicemen and today seven are being worked by the original settlers; there is little evidence of a desire among the younger generation to succeed to the crofts.

Until 1956, crofters on Reef used to graze both sheep and young cattle on the Flannan Islands, fifteen miles west of Uig.

Fig. 24 shows the age/sex structure of the population in the three townships. It tells a story familiar to crofting townships: 55% of the resident population are over forty-five years of age; 9% of the total population are permanently away; and since 1939 the population has declined by at least 15% as the result of emigration alone. But perhaps the most significant fact is the very small proportion of women of a child-bearing age and the consequence that only three children are being born each year to replace the older generations.

By their very position, the townships of the Valtos peninsula are isolated. Fifty years ago communication with the rest of Lewis was by boat. The road to Valtos and Kneep was built originally to bring the mails from the pier at Meavaig; the motor road to Reef was completed in 1956. Shopping facilities are provided at Valtos, for the people at Valtos and Kneep, and at Meavaig which serves Reef, Uigean and Cliff. These are supplemented by travelling shops which call once per week, by Indian dealers and by the local 'bus-driver who makes purchases in Stornoway on behalf of customers on the peninsula. The school for the whole area is situated mid-way between Cliff and Valtos and two kirks and the doctor's house lie at the junction of the Valtos and Reef roads.

Figure 28

Contrasting lay-out of crofts in an older township (Hacklete) and one re-settled by the Department of Agriculture (Croir). Note the relationship between croft boundaries and the better (i.e. potential arable) land.

493 Problems of communication are not, however, solved merely by providing better
494 roads: at least one household in four has a car or van, and this, with the fall in population,
495 has caused a fatal decline in the use of public transport. The Bernera 'bus service was
496 discontinued in August, 1959, for lack of demand. This is not, of course, an isolated
example; the problem is common to all the Highlands, and indeed, to all the rural areas of Britain: in Sutherland, for example, the number of registrations of private cars has risen to very nearly 250% since 1945, and the total number of registrations for all classes of vehicles up to 1958 had risen to almost 200%, while the number of hackney carriages, after reaching a peak in 1952, has since declined by 70%.

Note: in this table, "working units" include all crofts, whether stocked or not, and all other agricultural holdings. Two or more crofts worked together, whether registered under the same tenant or not, are counted as single working units. An agricultural holding is defined as one with at least one cow, or five sheep, or half an acre of cultivation.

231 the Napier Commission in 1883; these show that the Bernera region now keeps less than
233 half the former number of full grown cattle beasts but only a slightly higher percentage
311 of sheep. It is an unavoidable conclusion that resettlement and enlargement has not led
632 to greater agricultural efficiency: since it was carried out for social and not economic
[28] reasons, this is perhaps not unreasonable, but it augurs ill for the future of a community which must be largely dependent on agriculture.

Land Use and Cultivation*.

241 Before considering the details of stock management it is well to review land-use, for
[231] cultivation is subsidiary to, and directed at, stock keeping. Few crofts have no culti-

241 vation at all, but even fewer have more than 2.6 acres (table 29). Expressed as a percentage,
little more than a quarter of the total inbye area is even "old arable", of which only about two-
thirds is cultivated. Oats are every-where the most important crop: they are used almost
exclusively for fodder. Potatoes, mainly for domestic use, are the only other significant
crop; the absence of turnips is noteworthy. The crops are in general subject to some sort
of rotation within the physical limits of each croft unit; oats are usually undersown with grass
when the arable is to be left unploughed for a period but the "sown grass for pasture" is
[314] largely reseeded pasture land. The rest of the croft is left for pasture and hay, and, in
many cases the cutting of peat - a sure sign of agricultural decline. The inbye economy
depends upon so many unpredictable variables that it becomes extremely difficult to generalise
about the areas thus used. Forty-seven gardens exist in the Bernera region, but many of them
are almost 'notional' and others are merely potato patches: perhaps half-a-dozen are at all
well cultivated, for flowers or food.

241 The main change in the crops grown, apart from the introduction of sown grass, has
198 been in the corn crops, where barley has been completely displaced by oats. Barley was
grown up to 1936 - at least in Crulivig - and gave a good crop. It used to be pulled, (not
scythed), stacked, then the ears cut off with a sickle and the stalks used for thatching.
Probably the disappearance of thatch and the replacement of barley bread by the products of
the town bakery account for the decline in barley. Fewer potatoes are grown than formerly:
this directly reflects the decline in population. The absence of turnips is due at least in
part to the heavy incidence of finger-and-toe disease.

DISTRICT TOTAL	99	99	58	48	3	10

The fertilisers used in the past were dung and sea-ware. The sea-ware, mainly bladder-wrack, and the tough stems of oar weed, was, wherever possible, simply gathered from the beach, though in the more sheltered areas, particularly along Bernera Shore, it was actually cut and towed in rafts to the crofts. There seems to have been little rigid allocation of the rights in sea-ware. In Breaclete each croft had its own stretch of shore and possibly in Tobson, but elsewhere there seems to have been plenty for everyone. The actual gathering in March was a long, strenuous and unpleasant task. The application of sea-ware seems to have been rather rough and ready; certainly there was no careful selection of different types for different crops and purposes: presumably it was merely gathered, mixed with dung to facilitate the rotting, and spread on the arable after sowing. It is reckoned now that about 160 creels are necessary to the acre in Earshader and Lundale.

Table 30 shows the present use of fertilisers and manure. It will be seen that dung is still widely used but seaware is used in a minority of cases, particularly in Breaclete and Earshader. The first at least may be related to the various troubles that have afflicted the township, and to the fact that several holdings are in effect very small with but plots of cultivation. This also relates to the large number in Breaclete who use no form of fertiliser at all. Shell sand is neglected for reasons of inaccessibility: it is present on Little Bernera, and more particularly and of excellent quality, at Bosta. It is difficult to get from within the Island the large quantities of sand needed to qualify for the lime subsidy; it would be possible to get it from Bosta sands, there is a township road to within about a hundred yards of the beach, but the township is unwilling to open it to the wear and tear of lorry transport.

Artificial fertilisers are increasingly used. The first consideration at the present is undoubtedly that certain amounts have to be applied in order to qualify for the ploughing subsidies. This has overcome a reluctance engendered by early over-enthusiastic applications of sulphate of ammonia. Lime, in the powdered form or as nitro-chalk, is commonly applied. There is undoubtedly considerable ignorance in the application and use of artificials: they are often used only because of subsidy conditions, and the crofter is surprised, though gratified, when they have any practical effect. Certainly most crofters have no programme of their own of regular balanced applications to crop land. They need further advice.

The best balanced fertiliser policies are followed on the reseeded pastures, mainly because the crofters are careful to follow the directions they receive. They will follow advice in these matters when they can get it. In 1959 reseeding had been undertaken by 16 individuals, (20 acres) and by one township (Breaclete). Reseeding has definitely "caught on" as a means of improving the stock carrying capacity of a croft, with comparatively little outlay in labour or machinery.(1) It is, however, a new project: one may wonder whether the crofters will have sufficient pertinacity and funds to continue indefinitely. Reseeding is not cheap; it may cost £18 to £28 an acre and it is reckoned to cost £3 per annum to maintain. A considerable increase in output will have to be evident to make it worth the crofters' while to continue.

The methods of cultivation still include much spade digging, and some crofts depend entirely upon this. Horse and plough, though basically unsuited to the cultivation of lazy beds, can generally be used on most but the smallest beds, but the problem now is to get hold of a horse for ploughing. Hence - as in at least one instance at Croir - where it is impossible to hire a horse and the land is unsuited to tractor operation - the choice may well be between spade cultivation or no cultivation at all. The situation is not eased by the difficulty of hiring any one of the three tractors in the area at a time when the land is in the best condition. This is all doubly unfortunate because of the universality of the lazy bed; this might be regarded as a symbol of a backward or even a primitive agricultural system, but is, in fact, an excellent adaptation to natural conditions of climate and soil - so long as there is plenty of hand labour. It is only when labour becomes expensive, or difficult to obtain, that the lazy bed becomes uneconomical. This is, of course, another way of saying that the lazy bed was the concomitant of a desperately self-sufficient agricultural system; if it is well kept up, the lazy bed is a good means of conserving soil vitality and maintaining adequate drainage. In the past the hollows between the beds were cleared every year and the soil spread on top. Thus lazy beds, particularly those on slopes, need a good deal of hand labour as well as heavy fertilization.

It is very difficult to see the answer to the cultivation problem now labour is no longer freely available: there could certainly be more small tractors and cultivators, but even they lead to the throwing together of lazy beds, and - except in places such as Croir where drains may be laid below the loam on clay, or in certain favoured sites like part of 4 Cruliveig where the peaty soil overlies a firm gravel substratum - it is impossible both to throw the lazy beds together and maintain drainage. One is faced with all the difficulties of drainage of peat in an area of heavy precipitation. The hill lazy beds, though they are better drained, all too often have too little depth of soil to make cultivation by tractor a practical proposition.

(1) Editorial note: This remark has been borne out by events; in 1960 township schemes totalling 88 acres were thus improved.

CHAPTER TEN

EAST LOCH ROAG DISTRICT

(Garynahine, Callanish, Breaclete, and Tolsta Chaolis)

GARYNAHINE by Anne Iredale and Jennifer Oxenbury

Garynahine is a township of twelve crofts which are situated on the eastern arm of Loch Carnan Thulabhig. The crofts nowhere extend more than one-third of a mile from the coast. There is a hinterland of about 1,800 acres of common grazing, which is mostly about 100 ft above sea-level, though it rises to 200 ft in a few isolated areas; the crofts are lower, and maximum elevation is 80 ft.

Most of the croft land is drained by the stream Alli Mhurchaidh which flows through all but two of the crofts. But the soils are heavy, and several crofters cut peat on their crofts. Many crofters complained that their land was too peaty for cultivation.

The crofts form a regular pattern beside the south side of the main road from Stornoway to Breaclete, with two small feus and a 21 acre freeholding on the north side of the road. In addition there is a farm (Garynahine Lodge) of 400 acres east of the crofts, and likewise stretching along the south side of the Stornoway road. The main road to Uig passes through the farm, dividing the cultivated area in the west from the grazing section.

The regular lay-out of the crofts dates from the formation of the township in 1935. On the same site, but long cleared, there had been an older village about the same size as the twelve crofts, known to be in existence in the 1850's. The crofts were in a similar position, but were a different shape, and the ruins of some of the croft houses still remain. This village was completely burnt out one gusty winter evening when, it is said, a spark from a crofter's pipe was blown onto one of the thatched roofs, and the wind quickly spread the blaze to consume the entire village. The crofters left the area, many going to the neighbouring township of Callanish; Garynahine then became one large farm until 1935 when the land was re-allocated to twelve crofts. The new crofters came from a variety of areas, several coming from Cruliveig, others from Breaclete and Callanish. The owners of the farm had also opened an hotel which prospered until 1945 when the farm was sold to its present owner Admiral Drummond, who has since used the house of a private house. Nine acres of the farm land is cultivated, and the remaining 391 acres are used for grazing. In contrast to the usual practice in this area the oats have been undersown with rye grass. Another beneficial innovation at the farm is the introduction of shelter belts. Trees have been successfully planted, making it possible to produce good crops of soft fruits such as raspberries, strawberries etc. Both the crops and the stock on the farm are of a high standard, showing that with capital and correct management the land can be remarkably productive.

In contrast to the large scale economy of the farm, the twelve crofts (ten operative units) are each between 4.6 and 6.2 acres, and the total reputed arable is 67.3 acres. In all there are only 9.5 acres under crop (oats 6 acres and potatoes 3.5 acres), and 2.25 acres under sown grass. The crofts are worked either by spade, horse (hire from croft 40 Callanish) or by tractor (hire from the College). The seasonal rhythm of cultivation and of stock rearing is that of Callanish.

Enquiries soon reveal that crofting is not the main occupation of the croft tenants. Another indication of the declining interest in the land is the fencing of the crofts. All were fenced when they were formed in 1935; since then there has been no refencing. Now a grant is available to pay 75% of the cost of re-fencing but little has been done.

Stock totals (see Appendix C) have declined recently and this trend will probably continue. There are only four cows and two calves in the township (plus six at the farm).

There is no bull in Garynahine; the Department of Agriculture bull from Callanish is borrowed. Most crofters buy their milk either from the Admiral at the Lodge or from Stornoway whence a dairy delivers daily.

Eight crofters keep sheep; stocks vary between 5 and 30 per holding. Two crofters exceed their sourning (there is no equivalence in Garynahine because there has always been plenty of pasture). With a total of only 166 sheep and lambs on 1800 acres common pasture there is no danger of over-grazing.

The village has a good piped water supply from Loch Mhurchaidh, and has had electricity since 1954. There are excellent communications: 4 buses a day to Stornoway and also one bus from Uig and one from Bernera passing through Garynahine. These good communications have probably contributed to the declining interest in crofting.

There are only three full-time crofters (two of whom draw war pensions). Of the remaining 12 adult men permanently resident, 10 have regular or part time work, the remaining two being too old. Employment is either in Stornoway or at the Lodge. Only two people do part time weaving. Crofting is rapidly decaying in Garynahine. The croft land is reverting to rough grazing, and there is no indication of renewed interest in the land. Instead, life is becoming increasingly orientated towards Stornoway.

CALLANISH by Anne Iredale and Jennifer Oxenbury

Callanish must be one of the original settlement sites of the Hebrides, as it boasts an impressive standing stone circle and two other groups of stones. The stone circle is on a promontory, which projects into East Loch Roag. The promontory rises to about 125 ft, and then the land drops almost to sea-level at the neck (less than half a mile wide) which joins the promontory to the mainland. The township extends inland for about six miles in a belt roughly two miles wide. This inland area forms the common grazing. It is rough hummocky moorland with the general height rising gradually inland; the highest point is 425 ft.

The early crofts were situated close to the stone circle overlooking the Loch. The area was given to crofters who had been cleared from Linshader in the eighteenth century, and it is said that until the Crofter's Act the Callanish crofters had to return to Linshader to work for one day a year in return for this grant of land. But later the crofts on the more exposed westward facing side of the promontory were cleared and replaced by the 40 acre Callanish Farm. Some ruins of the croft houses still remain. The crofts then spread across the low lying neck to the main road from Stornoway to Breaclete, which now forms the boundary between the crofland and the common pasture. The crofland varies in quality, but it is mainly quite good potential arable. Fertiliser and manure are extensively used. Seaweed was widely used in the past but in more recent years the labour of gathering the seaweed has been out-balanced by the lower price of the artificial fertiliser. The main problem of the crofters is one of drainage, and in some parts the drainage channels have to be as wide as the strips of cultivation. Croft 29, situated on a small peninsula from the neck of low lying land, is almost cut off from the mainland at high tide.

The croft houses were then in two nuclei: one on each side of the narrow neck. Much later a third nuclei developed, known as Callanish New Park, further north along the Stornoway road, formed by evicted crofters from Bernera; they had had to sea in small boats with their belongings, and they happened to land at this point. They first became squatters on the common grazing but later gained crofter status.

There are 47 crofts in Callanish which vary in size from 2 acres to 9.7 acres. Some of the larger crofts are a result of private enterprise; the crofters have, without any

[TEXT CONTINUED ON PAGE 89]

Figure 34

Land-use in four typical crofts in Callanish. Notice that each croft is in two pieces, separated by the road.

427 311 authority, simply moved their fences and enclosed part of the common grazing. For example the crofter at 37, instead of having only the 6.7 acres of the croft has now almost 10 acres of land, of which the remaining 3 acres have been 'acquired' by enclosing part of
195 the adjacent common pasture. Some of the crofts are in two or three pieces, and in some
311 cases this came about in the late nineteenth century when the proprietor's wife, Lady Matheson objected to the position of some of the croft houses because they were too close
427 to the standing stones. Croft houses 25 and 26, then near the stones, were moved to the other side of the village and given parts of crofts 1 and 2 for their houses. Crofts 1 and 2 were given parts of crofts 25 and 26 as compensation for the parts of their crofts they had lost. Croft 27 also lost part of its croftland close to the stones so that an enclosure could be made around the stones. About the same period, before the passing of the Crofter's Act (1886), when the village was still 'ruled' by the township constable, and several other changes took place. Croft 27 and 28 used to be where the croft houses are at present and the surrounding adjacent area only; but it is said that the tenants of these two houses, being influential with the constable, obtained part of Callanish Farm. Similarly the tenants of crofts 30, 31 and 35 divided part of croft 19; these changes have become permanent. The most recently formed croft was taken from the common pasture in 1890. Since then three feus have been created, but two of these are holiday houses and the third has only 0.5 acres of land.

241 There are 36 working croft units with a total of 134.4 acres reputed arable. All but 6 croft units grow oats, and there are 20 acres under oats (appendix C). Of the remaining cultivated land 9 acres are potatoes and 5 acres sown hay. Most of the land is cultivated by tractor; there are 6 tractors in the township. In the past there were several horses but now there is only one. Five crofters still cultivate by spade. The crops are sown in April, and the hay is usually harvested in August and the oats a month later according to the weather.

231 Thirty-one cows, six heifers and 25 calves are kept in the township and tethered most of the year on the crofts. It is usual for the crofters without a cow to graze one of their neighbour's cows for part of the year in exchange for milk. There is a beef-type short-horn bull belonging to the Department of Agriculture, which is kept on Callanish Farm.

233 The 5,302 acres of common pasture support an individually owned stock of 904 sheep
317 and 561 lambs. Several crofters exceed their souming, but there is no shortage of grazing. Some of the sheep graze on Garynahine township pasture. Callanish also has the use of the pasture on Orasay island; each year some of the sheep (one sheep or ram
221 per croft) are taken across by boat for a period. The breeding ewes are brought in for
233 tupping on November 14th, after the harvest is complete, and lambing takes place in April. The crofters open their gates for winter grazing from November 1st to May 10th; in addition Callanish Farm (which has no sheep) is open for winter grazing. The sheep are sheared in July, and the lambs are taken from the ewes a month later. The lambs are dipped in November and the other sheep in December. Shielings at Flodavat are known to have been in use until 1921.

491 Communications are quite good; the village is close to a main road to Stornoway, and
131 there are four buses a day. But within the village itself many of the so-called roads are merely rough tracks, and one croft, number 29, is inaccessible by motor vehicle; it is
449 over a mile from the nearest track, separated from it by rough peat land. This year a grant from the council was made towards the cost of construction of a road to this croft; but several of the Callanish crofters who cut peat on the intervening land refused to allow a road to be built, and so croft 29 is still almost cut off from the rest of the village.

131 There are two shops in Callanish (one with a petrol pump); grocery, butchers' and fish
366 vans deliver frequently. Callanish also has a stone jetty which in the past was important. There was a ferry for mail and passengers from here across to Uig and Bernera calling
504 at Linshader, which gradually declined in importance until the 1920s when it ceased to
505 call at Linshader. The ferry to Bernera finally ceased in 1940 when the ferryman (who lived at Callanish Farm) left for war service. After this the jetty was still used by small private boats (e.g. Callanish church serves Linshader, and many people came to church by boat until recently), but gradually it has fallen into disuse.

312 There is no piped water supply and after even a short period of dry weather there is a
600 water shortage. One prosperous crofter (where the crofter does weaving and one member of the family is periodically away with a Norwegian whaling fleet) bought a large modern Bendix electric washer only to find that there was not sufficient water to use it except on
358 rare occasions. The croft houses have had electricity since 1954, and even the three remaining inhabited thatched houses now have electricity.

311 Although there are only 4 full-time crofters, most of the crofts are carefully and well worked. Only a few crofts are decaying, and there is a tendency for these to be sub-let to the more agriculturally inclined crofters instead of allowing the land to revert. In
288 addition to the full-time crofters, 31 other men do part-time crofting. Eighteen men weave and this provides their main income, but this figure fluctuates according to the prosperity of the Harris Tweed industry; at present the figure is probably higher than
166 average. Although 32 people have emigrated from the township since 1939 (many of them
164 young people who have married on the mainland), there are still several young people and
162 young families making their homes here. The dominant age-group of permanently resident adults is 15 to 44. Total population is steadily declining, but Callanish has always been a prosperous area and seems likely to remain among the more prosperous crofting communities.

BREASCLETE PARK by Margaret Grice and Doreen J. Phillips.

195 Breasclete Park, also known as New Park, Callanish, was settled by people cleared
427 from Reef in the mid 19th century. Two of the six original crofts have been subdivided, making nine. However, there are only five working units and on one there is no cultivation. There is also a feu house built in 1958.

361 The crofts, which are fenced, form broad strips perpendicular to the Breasclete-Callanish road. Cultivation is mainly by tractor, oats, potatoes and some clover being
241 grown. One progressive crofter has successfully experimented with re-seeding one
231 acre of grazing land on his own croft. Common pasture for the 148 sheep and 6 cattle is shared with Callanish, and for most purposes the Park can be considered a part of that township.

162 The total population is 26 of which 4 are permanently away. There are 6 people over
65, and 8 children under 15.

BREASCLETE by Margaret Grice and Doreen J. Phillips.

131 Breasclete is situated on the east side of East Loch Roag on land which rises gently
133 from the seashore to the moorland and is interrupted by rocky outcrops of gneiss in the northern part. It is separated from the township of Callanish to the south, by a small westerly flowing stream, at the mouth of which is the site of a mill.

491 The road on which most of the houses are situated, follows a curve through the
361 middle of the crofts, but newer houses and some feus have been built along the main Callanish-Cartoway road, nearer to the shore. Stornoway is 18 miles away along this road which is turned throughout. Breasclete could be served by the still uninished Pentland Road, were it to be properly surfaced and this would make the journey shorter
449 by 4 miles. Two buses in each direction per day connect the township to Stornoway, but
471 high fares make visits to the town infrequent.

312 The township hopes to receive the mains water supply within the next few years, but, at the moment, relies on wells within easy access of most of the houses. Many houses have piped water from private wells, some of which go dry after two or three days good weather although the wells on the lower ground never fail.

000 weather although the wells on the lower ground never fail. Mains electricity was insta
354 7 years ago, but on the whole cooking is still done by Calor Gas and peat. The chief source of fuel for heating purposes is peat, alghough a little coal may be used.

427 There are 63 registered crofts, including many subdivisions, a small-holding of 15
361 acres formerly the Mill, and 10 feus, all of which are worked as 54 units. The crofts lie as long narrow strips in a NE - SW direction from the moorland to the sea. All are at least partly fenced, the fencing being of recent date. Some crofters are, at the moment, making use of fencing grants to enclose their land completely.

241 The only crops grown are oats and potatoes, and although a little clover mixture is sown for hay, many crofters find that the natural grass is sufficient for their needs. Vegetables are produced in a few gardens, but most people do not have enough time or interest to bother with them. Flowers rarely flourish owing to the lack of shelter.

311 Far less of the croft is cultivated now than in the past, and the land nearest the sho
178 part of which was once cultivated on a run-rig system is now unfenced and used entirely for grazing together with some peat cutting. A piece of the common grazing has been improved by application of shell sand and chemical fertilisers and reseeded. This experiment in which almost the whole township took part has proved very successful an there are plans for further reseeding. Details of crops are given in Appendix C.

467 Although the tractors of which there are two in the township are used wherever poss
the spade is still used on many small patches, particularly for potatoes. Much hay is
231 cut by mower but scythes are used to a large extent. There is still one horse in the township but it is scarcely ever used for ploughing except by its owner.

233 The total number of sheep kept in the township is 1,500 i.e. 2½ times the souming which here is 2 cows and 5 sheep per £1 sterling rent. 40 crofters keep sheep but none have sufficient to make a livelihood from sheep alone. Many lambs are lost on th survive the winter. The number of cattle
231 kept is 84, i.e. only 1/3 of that permitted. It is usual for each household to keep 1 co and 1 calf which is generally sold after 6 months when a subsidy can be claimed. Breasclete has no mill, but shares the one from Callanish. Most households keep sufficient poultry for their needs but no eggs are marketed.

Shielings were still used to some extent up to 1938. Now it is not necessary as fewer cows are kept than formerly. With the reduction in numbers of stock the commo pastures close to the village are being colonised by heather.

221 The crofters' year begins at the end of March when the ditches are cleaned and the
241 land is prepared. In April the ground is ploughed, fertilised and sown with oats and
233 potatoes. The sheep are dipped and by the 10th of May must be out on the moors as the
314 crofts are then closed to common grazings. Soon after this peats are cut on the moors two or three miles from the village. After about 20 days the peats are lifted and carri to the Pentland Road by tractor where they are stacked to await the lorry which takes them to the village.

In June, the sheep are gathered into the fank for shearing and the cows are usually brought to graze on the crofts from the nearby moors. If the croft is not fenced they must be tethered. At the end of June the clover is cut, while the potatoes must be cleaned and hoed. In August the lambs are weaned and dipped. Natural grass is cut for hay and if there is any first year sown grass this may yield a second crop in September, together with the corn harvest. When the potatoes have been lifted in October the crofts are opened and the sheep are brought in for the winter. Final dippin takes place in November.

162 Out of a total resident population of 226, 56 are under 15 years and 57 are over 65 years of age. Of the resident tenants 9 are between 15 and 44 years, 19 are between 44 and 65 years and 26 are over 65 years of age. Twenty on persons are periodically
000 away e.g. students and seasonal workers and 29 are permanently away. Since 1939,

Since 1939,
166 54 people have emigrated whereas only 4 have immigrated. Most of the girls have to
462 leave home when they finish school as there is no employment locally. Many of them go into domestic service or nursing in Glasgow. Many of the younger men also spend time away from home, often in the Merchant Navy. Breasclete is also the temporary home of the families of lighthousemen on duty in the Flannan Isles.

288 Although the people live and work on the croft, weaving the Harris Tweed provides the main source of income. This is a rather irregular occupation owing to the uncertain demand for the tweed, and although the men are nominally self-employed they rely on the mills to supply them with work. The tweed is woven on treadle looms which, with ancillary equipment such as bobbin winders, are all owned by the crofters.

[458] As 1959 was a good year for the tweed industry, there was an air of prosperity in the township, and with the aid of government housing grants many new bungalows were being erected. But should there be a slump, the crofts would be unable to support the population and most of the bread-winners will have to leave.

TOLSTA CHAOLAIS by Roger H. Thomas.

131 The township of Tolsta Chaolais lies in a shallow glaciated depression occupied by Loch
133 a' Bhaile and Loch Shader. Most of the crofts are situated near the shore of these lochs,
361 for westwards to the sea the terrain is too rocky and irregular for either settlement or cultivation, whilst to the east of Loch a' Bhaile the land slopes precipitously from 250 ft. to the loch shore. As Figure 36 shows settlement takes advantage of the more gentle drift-covered slopes, generally of small extent.

137 Cultivation is very noticeably limited to three areas - along the west shore of Loch
a' Bhaile, along the north-east shore of Loch Shader, and in the valley of the small stream
● [241] draining from the north into the head of Loch a' Bhaile. Most of the croft land is composed of rock outcrops, rarely exceeding 100 ft. in height, separated by damp depressions frequently filled by reeds and rushes; bracken was apparent only on three crofts. In particular, the area between the two lochs is badly in need of draining and is largely colonised by reeds and very coarse grasses, of no use whatsoever as pasture. One enterprising person suggested that the township should hire a ditching machine - this could certainly be put to use with great advantage.

632 The settlement comprises 43 registered crofts, 6 feus, 2 squatters, 1 cottar, and
311 2 holiday bungalows, with the croft holdings aligned north-east/south-west between the
427 two lochs and the sea, except for nos. 28 and 29. The 53 holdings are unofficially amalgamated in various ways and so reduced to 35 operative agricultural units. The acreage of crofts varies from 2.2 to 20.75 acres - a considerable variation. Fencing of the crofts - except for 1A, B, and C, and 12A, B, and C which are held 'run-rig' - was carried out between 1945 and 1950, whilst in 1946 the common pasture of 2,700 acres was fenced into two parks - an inner and an outer one, the division coinciding with the Carloway to Breasclete road. An area stretching from crofts 18A to 21 has, however, been most haphazardly divided. The seaward halves of some five crofts were redivided amongst seventeen crofts in the southern half of the township to compensate them for lack of grazing area within their own croft boundaries. This division is said to date from about 1886.

241 Most of the cultivation is carried out with hired tractor, although two crofts owned
[467] small mechanical cultivators. Ploughing by tractor and horse, as opposed to spade cultivation, depends either on the urgency of the operation, or on the accessibility of the plot, for any small patches of cultivation on the rougher terrain are dug by spade, as

[TEXT CONTINUED ON PAGE 95]

● 241 are usually all the potatoes. Between the road and Loch a' Bhaile and between the unmade road and Loch Shader on crofts 22 to 25 the land is probably more intensively cultivated than ever before, but strips now overgrown with rushes and coarse grasses, especially near the cemetery give an idea of the former extent of cultivation. The working of strips nearer the sea is no longer worth the labour involved. Crofts 22 to 25 are further divided by the small Loch Shader; no. 28 however makes good use of a small alluvial flat at the head of Loch a' Bhaile.

[232] Artificial fertilisers are in general use together with lime and dung. However some crofts were using seaweed, in particular nos. 1A, 1B, 1C, 4, 5, and 25 - i.e. those
[824] crofts with easiest access to the sea. The seaweed is gathered in the New Year and trodden into the ground in the spring and apparently gives excellent results, but too much
423 labour is involved in carrying it to crofts in the centre of the township. Forty years ago each croft had rights to the "red" and "black" seaweed along the coast.

The crop acreages for the whole township will be found detailed in Appendix C (1). The area of oats for each croft varied between 0.25 and 2.50 acres whilst the maximum for sown grass was 1.5 acres. The excellent crops of hay from sown grass would suggest its further extension, but unfortunately most of the land suitable for cultivation is already under oats and potatoes. The practice of undersowing oats was not particularly widespread whilst only two small strips of oats-rye mixture were found. One crofter had also obtained good results in a small patch with seven different vegetables, whilst soft fruits are to be planted next year. The two sets of 'run-rig' crofts practise a fixed run-rig with the usual rotation of oats and grass on the strips.

231 In cattle stock (Appendix C) the township has 28 three year-old beasts, 2 one year-olds, and 24 calves. Only 6 registered occupied crofts have no cow, two crofters have two cows each, and one crofter has two cows and two calves. The township has no
[178] bull however and the nearest is at Carloway or Callanish. With a much smaller number of cattle than that of thirty years ago there is now no need to make the annual summer visit to the shielings, a practice which died out in Tolsta Chaolais between 1920 and 1930. Pastures could however carry three times the present amount of cattle. The souming
233 of 1 cow and 6 sheep per £1 rent is now apparently ignored. The approximate total of sheep for the township is 1,500 whilst for 1958 it was about 1,470. The total of lambs was approximately 520 but most crofters found it difficult to give an accurate figure since some might have been lost on the moor during the summer. The highest number of breeding ewes for any one croft was 112, of lambs was 34, and of other sheep was 26; five crofters however have no sheep at all. Before 1939 a shepherd was employed by the township when the sheep were sent to the moor. The shepherd was usually a young boy just left school and was paid by each crofter according to the number of sheep the latter
[231] sent to the moor. This has been discontinued but a levy, of 5s. per croft and 2½d. per head of sheep, is made for the upkeep of the township fence. Finally, almost every crofter keeps at least a dozen poultry.

221 The movement of stock over the grazing areas is summarised as follows:
231
233

(1) From November 13th to May 1st. cattle are usually in the byre, depending on the weather, and sheep can wander anywhere. Crofts should be open to common grazing unless all the crofter's stock remains within his own croft boundary.

(2) From May 1st. to May 20th. sheep are in the outer park.

(3) On May 20th. sheep are sent to the moor.

(4) Throughout the summer cattle are in both the inner and the outer parks.

(5) On October 1st. the sheep are brought into the outer park.

(6) On November 13th. the sheep are brought into the inner park.

464 Details of population and employment will be found in Appendix D. It is a very
[463] striking comment on the state of crofting in this township that only four persons are

of unit: the result (Table 49) does not suggest that the possession of a large agricultural unit encourages a man to become a full-time rather than a spare-time agriculturalist. Indeed, the possession of a large unit, built up by amalgamation, is often a fortuitous [462] result of marriage, death, or inheritance, rather than a matter of individual choice. The only significant correlation in the table seems to be the understandable tendency for female croft workers to work the smaller, rather than the larger, crofts.

241 The cultivated land

311 631

The chief crops are hay, oats and potatoes, in that order:

DISTRICT	Acreage of: Oats	Potatoes	Hay	All Crops	Average per unit
South Uig	149	50	209	407	2.5
Bernera	121	38	69	228	2.0
East Loch Roag	83	35	170	288	2.1
Carloway	113	42	202	357	2.2
TOTAL	466	165	650	1,280	2.2

241 Barley, which in the form of bere was important until the 1920's, has almost [178] disappeared. Turnips, marigolds, rape and other animal food crops are only grown

241 here and there in small patches of less than a quarter acre and therefore do not appear in our summaries, appendices A (1) and C (1).

The amount of cultivation carried out depends on three factors:

(i) stock, particularly cattle, to be carried through the winter,
(ii) size of family, which influences the amount of potatoes grown,
(iii) available labour, because cultivation is mostly by hand, especially in South Uig and Bernera.

The size of the effective agricultural unit has little influence on the area cultivated although it may bear some relation to the amount of natural hay taken. This can hardly be regarded as 'cultivated' and the acreage is difficult to estimate; the custom is to cut as and when weather permits, and wherever there is a convenient stand of natural grass.

Hand labour is a necessity on most crofts in the Bernera district and on many elsewhere. The traditional 'lasy-bed' - a long narrow strip of cultivation bounded by deep ditches which may be half as wide as the bed - is a necessity on broken, rocky ground on which the only soil is peat, which often has to be gathered into hollows in order to get sufficient depth. The small size and long narrow shape of most crofts do not lend themselves to tile drainage, which is almost unknown. If it could be extended it would be a great advantage but, in general, it would have to be organised by townships, or at least by groups of crofts, and the whole trend in management of croft land is towards individual occupation and use.

241 This may not always be a good thing. Fencing is a case in point. Until the last 417 ten years fenced crofts were rare although small parts of crofts might be fenced and, in some cases, a group of crofts might be fenced off from the rest. But, in general, the 178 crofts were common land in the winter and used individually only from May to October. Fencing grants, and the encouragement of sown grass in rotation with oats, have 233 changed this. A great rash of fencing is appearing. This may not be altogether a good thing, particularly for the sheep in winter and spring: even if gates are still left open, stock are deprived of the ability to move for shelter. There may also be watering difficulties. Co-operative draining, cultivation and grazing, of groups of crofts if not of townships, would be more efficient and more productive.

241 Finally, we may remark on the curious insistence on hand cultivation of oats and potatoes for consumption on the croft, whilst cash crops well suited to hand labour, and [43] which would be far more rewarding, are neglected. Flowers, vegetables and potatoes are imported into Stornoway daily on the mail steamer and even by 'plane. Neither climate nor soil prevents their production in Lewis. Moreover such crops could provide a much needed source of additional income. A few croft gardens produce excellent soft fruit and as the local season differs slightly from that on the mainland there would seem to be possibilities here, too. There have been virtually no [176] agricultural innovations since the potato.

Economic and Technical Factors.

434 The agricultural income of a croft arises from:

(i) the sale of livestock, mostly store stock at the spring and autumn sales,
(ii) the sale of the annual wool clip,
(iii) the receipt of certain annual subsidies and grants.

These are the main items; in addition some may sell small amounts of potatoes, eggs and standing hay; a very few sell a little milk although strictly this is illegal. Such an annual income comes in three or four annual instalments, uncertain as to date and amount. Moreover, a crofter may suddenly and unexpectedly find himself deprived of a large portion of his income due to casualties amongst his stock or poor demand at the seasonal sales. Unlike the mainland farmer, should an islander withdraw his store

17 or summer pastures for the tenants of Laxay and Harnish respectively, townships on the north
175 shores of the loch. In 1775, there were four tenants in Kershader, but their place of origin
162 is unknown. In 1805, five tenants are recorded, two of them from Uig; by 1826 there were 10
341 tenants. Thus the growth of population in Lewis during the second half of the eighteenth century
31 may well have been the major reason for the colonisation of one of the least agriculturally
161 attractive districts of the island.

From Figure 1, which shows most of the thirty-four occupied places south of Loch Shell about 1828, it is evident that colonisation had extended south into the mountainous area. The evictions, which commenced in Harris in 1816, may have increased the population already there as early as 1660, for many of these families came from Harris. The numerous shielings in South Park speak of a vigorous community; it is possible that South Park was more densely populated than the northern area up till 1800.

162 During the period 1818 to 1842, when the grazier, Donald Stewart, and his brothers had a lease
175 of South Park, most of these settlements were cleared (Fig 2): in addition, between 1838 and
341 1843, 68 tenants and sub-tenants in Shieldersish, Cleiter, Seafyrthbaed, Lemreway, Oronsay,
31 Stoinrabagh and Iagion were removed, in all about 436 people. Some 27 families were sent to
161 Crossabost in North Lochs; others went to Tolsta and Tong in Stornoway parish, and some emigrated. The main body of those evicted settled in the townships in North Park: Marivig in 1838 had 6 tenants; by 1850, 22 are recorded. Thus the present distribution of population crystallised about 1840 and by then the townships along the shore of Loch Erisort from Habost to Garryard were well established. The Minch coast townships from Cromore to Gravir, first settled about 1800, were greatly expanded, and Park south of Gravir became a sheep grazing devoid of small tenantry.

175 In 1844, the Seaforth family, which had held Lewis for over two centuries, sold the island to
423 Sir James Matheson. The estate management soon wrought great changes in the landscape. Until
311 1850-52, the run-rig system prevailed, a system whereby a group of joint tenants, or a to man
341 and subtenants, cultivated in small patches what arable land had been reclaimed, each one being periodically re-allocated. The crofts, or individually held land, date from 1850-52, when
241 the land was lotted and most of the present crofts were formed at this period. The settlement pattern associated with run-rig was one of closely nucleated groups of houses but when run-rig was abolished, houses were built on the individual crofts.

175 In 1858, Lemreway was once again made available to crofters, most of whom came from the
162 fishing townships where population pressure was building up. After the disastrous potato famine
423 of 1846-7, and the final failure of the kelp industry from 1840 to 1844, the population of the Outer
341 Isles experienced great hardship. By the early 1850's, the lotting of the crofts and the rapid
731 development of the fishing industry brought a period of prosperity and the population grew rapidly
227 especially in the fishing townships of the Minch coast. The prosperity was such that numerous
161 cottars built houses on the lotted crofts, and their stock-keeping on the common was tolerated because of the demand for fishing crews. About 1884, the system whereby each boat was tied to individual fish merchants, who advanced meal and provisions against the catch, was discontinued. When this system was replaced by the auctioning of catches, such was the privation in Lewis that the Royal Commission investigating the poverty of the population in 1888 found conditions almost as severe as those prevailing during the potato famine forty years earlier. It was during this period
685 that the Park Deer Raid occurred. Park became a Deer Forest in 1883 at the end of the grazier's lease. In 1888, as a demonstration of their grievances, a large number of crofters from the Park townships went into the Deer Forest and killed about 200 deer, cooking the meat in the open for all to see. Some were arrested but after trial acquitted. A few good fishing seasons remedied this unhappy situation and the population of the fishing townships rose to a peak in 1911.

[115] 1 Evidence given to Royal Commission of Inquiry into Crofters and Cottars 1883. (Also known as the Napier Commission).

[115] 2 Report on the Conditions of the Cottar Population in the Lews, 1888.

their souming, two are at par and the rest are below, but not far below,
kept at all; but, whereas only six of the fifty six total units have no catt
are without sheep (14 crofts and 9 feus). For an analysis of the statisti
area see tables I, II, & III. The most interesting feature of the compa
the figure for sheep, for in spite of the fact that Park Carloway has an e
the joint figures do not exceed the total joint souming for the townships.

CARLOWAY PARK

361 427 In contrast with the excessive elongation of the crofts in Upper Carl
Park Carloway form compact blocks. Another unusual feature is that
were lotted five field drains per croft were laid at a depth of eighteen in
have something to do with the good quality of the land. Nineteen acres
worked in five effective units that form a distinct block of cultivation.

* In 1960 and 1962 172 acres of common pasture were reseeded.

361 is attached to the Free Church Manse, is sublet to two feuars and is used entirely for
427 hay. One remarkably well stocked croft has one horse, two cows in milk, one calf and a heifer together with a sheep stock of twenty breeding ewes, twenty lambs and twenty other sheep (this was the first 100% lambing for many years). Labour is provided by one full time crofter with assistance from two others one of whom is a weaver. On another croft an elderly lady was preparing to make an application for a cultivation grant.

241 The intensity of cultivation may be attributed to two factors; first the sheltered position of the land, the moderate slope and good drainage and second to the energy and enterprise of the crofters.

BORROWSTON

361 Borrowston exhibits many of the characteristics that have been noted in Upper Carloway
427 and which are common on the north west of Loch Carloway. It consists of sixteen registered crofts and there are no feus. The crofts were lotted in narrow strips which rise steeply from the western shore of Loch Carloway to a head dyke at about 200 feet O.D. The drift cover thins as the ground rises until an upper zone with exposures of bare rock is reached. The result is that most of the cultivation takes place below the road which passes through the croft land and along which the settlement is located. All the crofts are fenced below the road, but are only partly fenced above it, presenting a pattern similar to that at Upper Carloway. Because of the steepness of the crofts the only way that the tractor can gain access to the land is by way of the lower road which passes from the bridge to the pier.

241 Fifty four acres of croftland are worked in fourteen operative units on which the oats are cultivated by tractor and the potatoes by spade. Though all the crofts have immediate access to the shore none are fertilised with seaweed at the present time; following the common practice in the area artificial fertilisers are used to supplement lime and manure
233 from the byres. None of the crofts are open for common grazing in the winter; this is because of the use of the old farm of Laimshader, granted to the township as an enlargement. The former arable land is now used as additional common pasture. The normal practice is to use the former farm land in conjunction with the croft land in the summer, the cattle being maintained on Laimshader as late in the season as is possible.

241 Borrowston is intensively cultivated, presenting a prosperous picture when viewed from the opposite shore of the loch, but in spite of its apparent prosperity the majority
[162] of the population is over 45 years of age. Herein lies one of the main causes of concern in this part of Uig parish, for though Carloway is in many ways more prosperous than is
181 south Uig and has a larger and more active population working in much more favourable conditions, the population is an aging one that has not the potential for maintaining a
[162] level of replacement. In Borrowston eight of the crofters depend on weaving, four are full-time crofters and seven of the twelve are over sixty five. Yet these men are active and maintain large sheep stocks, ten of the twelve exceeding their souming though only one of them has an excess of cattle.

Figure 40[1] has been drawn to illustrate the land use on particular crofts in this
233 northwestern area; one is in Borrowston and one is in Upper Carloway. The stock data
427 have also been added to give the complete picture of the agricultural unit. Each croft though prosperous, has an elderly tenant.

GARENIN

DUN CARLOWAY

361 Dun Carloway though clearly of a similar type to the other townships south of Loch
Carloway has certain features peculiar to itself. The croft land may be divided into
427 two sections; crofts 18 to 23 occupy the deep trench which extends from the Dun Carloway
school to Loch Carloway itself. These holdings are larger than the average discussed
above and are divided in broad rectangular block. To the west there is a less deeply
entrenched zone where the crofts are long and narrow lying up and down slope like those
241 of Borrowston. Short steep and narrow lazy beds characterise the cultivation which
follows the pattern set in the other townships, although the areas, as has been noted
above, are much larger in some cases; the largest have up to twenty acres. Despite
this increased size no croft has more than two acres of oats. The low percentage of
land under cultivation is only in part explained by the difficult nature of the ground and
46 the limited use which can be made of the tractor. Few crofters are willing to attempt
more cultivation (to provide extra feed for store cattle or some other form of stock
[288] enterprise) so long as the income from weaving is satisfactory. The concept of the
croft as an ancilliary employment appears to have defeated its own object, for with the
population at its present level, and with the income from weaving as it is, very few
crofters are prepared to do more than provide milk for the family, (with the annual cow
and calf subsidies, and the proceeds of the sale of the annual calf as by-products) and to
derive what income Providence rather than goodmanagement may allow from the sheep.

427 The total area of individually held croftland is 194 acres which is worked in twenty
five agricultural units derived from twenty six crofts, nine feus, one 'free gift' holding
311 and one squatter. The cultivation is accomplished by one horse and one tractor, each
fo which is owned within the township.

311 The total souming is exceeded, the main reason for this being the gross overstocking
of sheep; 187.4% of the soum. This overstocking cannot fail to have a harmful effect
on the common pasture, promoting an increase in the bracken already visible on some
of the croftland itself, under-nourishment and disease. The poor quality of the hill
pasture is brought home by a comparison with the grazings of North Uist where the most
striking feature of the landscape is its greenness after the heavier browns of Western
Lewis. Regeneration by surface seeding would certainly be helpful here.

SUMMARY AND CONCLUSIONS

128 The tables given in appendices C and D form the basis for much of the comment in the
preceding pages. They must now be considered in the light of the general tendencies
which they illustrate in the changing livestock economy units.

241 Appendix C(1) elucidates the working of the crofts. The picture is somewhat com-
311 plicated by the large number of non-crofting holdings in the area, of which 43 carry
stock (a quarter of these sublet croftland). The number of feus also tends to mask the
23 process of amalgamation of crofts to form larger working units; a process which has
43 been taking place for some time. There are in this connection one or two cases of the
427 cross working of crofts between individuals in neighbouring townships. The figures for
these units have been included with those of the township where the tenant is resident.

241 Oats are the most important arable crop. The acreages of sown grass for hay and
pasture are much lower in comparison. Permanent grass, mostly old arable land, is
to be found on 52% of the total area of land occupied as crofts and feus. A large propor-
tion of this is on very thin soil where bare rock is exposed and on wet land, but even so
it does show that much more of the land might be under cultivation or improved grass.
[148] The decrease in cultivation since the late nineteenth century is probably much less than
that for the Valtos area of South Uig where about 70% of the inbye and outrun is under

241 178 permanent grass. The pre-eminence of the Carloway area is then only a relative one where the decline in cultivation is taking place at a slower rate. Isolation, the decline in fishing and the lack of alternative employment leading to a greater decline in population may explain the more rapid decline in the Valtos area. Whether Carloway will see a similar decline remains to be seen.

Table 35

Stock carried as a proportion of total soum of each township - Carloway district, August 1959

231 311 232

TOWNSHIP	All Stock	Cattle	Sheep*
Carloway	63%	53%	70%
Carloway Park	87%	64%	119%
Borrowston	74%	15%	121%
Garenin	97%	30%	160%
Knock Carloway	64%	30%	90%
Kirivick	73%	25%	124%
Dun Carloway	104%	21%	187%

* As recorded in some cases these figures are too low (see Appendix C (2)); the maximum error is probably around 10%.

128 Table 35 summarises the agricultural system; further details of the relations between size of unit, status of tenant, stock of cultivation, will be found in Appendix C (3), (4), (5) and (6). Though the total soumings (that is the conversion of both cattle and sheep units to 'cow units' expressed as a percentage of the souming) never fall below 60% the sheep souming is exceeded in five townships and that grossly in two cases. Once again however this is not as serious as it is in the Valtos area where soumings are exceeded by up to three times the figure allowed. Nor does the mere statistical analysis reveal all the picture for it is essential that a proportionate number of cattle be kept so that the grazing of both cattle and sheep may regulate the growth of the grass. As it is, the relative and absolute increase in the numbers of sheep is having a serious effect on the quality of the pastures.

231 233 311

Sheep are given less attention that the cattle whether they need it or not and few of the present generation are prepared to tolerate the life of the shieling in its old form where the cattle were taken in the summer. In consequence the grazing on the outer moor is almost entirely given up to sheep. The shielings are now only marked by small broken stone mounds which were once the shelters and by the small surrounding areas of greener sward. The changing aspect of the hill landscape has already been mentioned.

231 Comparison of the totals given in Appendix C (1) shows how the present pattern is developing. 167 milk cows are being raised on 171 agricultural units and with these are 113 calves. Appendixes C (5) and C (6) indicate that the agricultural unit farming the basis of farming is the single milk cow and annual calf which carries a subsidy if it passes the inspector of the Department of Agriculture. A few crofters are raising young beasts for sale but there is a general unwillingness to grow more fodder to raise cattle for an uncertain market which may be affected at any moment by an increase in transport costs which are already high. Without the subsidy such enterprises would hardly be possible at all and indeed one could say this of many aspects of life in the island today. Some of the calves are wintered, but the usual practice is to sell off late in the year.

distinguishes the unconsolidated pieces of three selected
crofts. In Marivig, the crofts are all consolidated).

/facing p. 5/

427 Crofting, a distinctive system of land tenure, is confined to Argyllshire, Inverness-shire,
241 Ross and Cromarty, Sutherland, Caithness, Orkney and Shetland, the seven Crofting Counties of
178 Scotland. Small agricultural units sharing rights in common land, usually pasture but in some
423 districts arable land also, survive in 151 out of the 163 parishes, and these holdings form the
477 nearest equivalent to peasant communities in Britain, although only a small minority of crofters own their holdings, and the true subsistence element, implicit in any definition of peasantry, has all but disappeared.

175 Before 1886, the crofter was a tenant-at-will, with no security of tenure, and no right to
427 compensation for improvements. The Crofter's Act of 1886, defined a croft as an agricultural
241 holding in a parish where there existed, or had existed, rights of common grazing, and where the
423 annual rent paid was less than £30. Security of tenure, and compensation for improvements were the main provisions of the 1886 Act; the rent qualification was later raised to £50. In all, there are about 20,000 crofts in Scotland today[1] and Collier[2] estimated the crofting population at
[161] about 100,000. The number of crofts in Park is 215, with population of 908. Thus Park forms
[162] a 1 per cent sample of the crofts, and a 0.9 per cent sample of the estimated crofting population.

Crofting Organisation, Layout, and Settlement.

423 The characteristic settlement unit is the crofting township: Figure 3 illustrates the areal
427 distribution of the 12 townships in Park. Each township comprises two main elements, the
241 individually held croft land, and the common grazings. The number of crofts per township
311 ranges from 6 in Caversta to 43 in Gravir.

432 The individually held croft land (1,839 acres) is partly 'outrun' or permanent pasture and the
233 holdings are usually but not always consolidated - in Gravir (Fig. 4) and Cromore some of the crofts comprise as many as five non-adjacent pieces of land. Each croft is normally separated from neighbouring units by a drystone dyke or fence but in Park, such demarcation is the exception rather than the rule.

The croft land is separated from the common pasture by the township dyke, a stone or turf wa
The Park common pastures consist of 22,023 acres of moor grazing - generally very poor, ill-drained land with a large percentage of bare rock, areas of peat, and numerous lochs. In Park, only Oronsay common pasture is fenced, the limits of the remainder being faintly marked by crumbled turf dykes. Each croft has a defined right of grazing or 'soum' on the common pasture; the 'soum' is the number of beasts which may be pastured, a term comparable to the obsolescent 'gates' of northern England. In Gravir, the soum is 1 cow and follower or young beas up to 6 quarters old (i.e. 18 months), and 8 sheep, per £1 rent. There is also a system of stated equivalences (Gaelic 'coilpeachadh') in most townships whereby substitution of cattle for sheep and sheep for cattle is permissible: in Gravir, the exchange rate is one cow for five sheep. Soumings and equivalences vary throughout Park. In former times, when a subsistence economy prevailed, soumings were enforced but nowadays the majority of the crofters do not even know the souming o their croft.

[13] 1 Crofters' Commission, Annual Report 1958.

[13] 2 Adam Collier, "The Crofting Problem", 1953.

Fig. 5. Kershader - Land use. The inset shows the complete layout of the township: A - the Croft land, B - Re-seeded Grazing Parks, C - The inner fenced area of the common grazing. The former shielings belonging to each croft are also shown: the numbers correspond to the crofts numbers. (Redrawn from 1:2500 fieldmap by P.W. Wheeler, M.A.)

Figure 2.81

Although the croftland is individually held, individual control of the crofts only applies for six months of the year. After the harvest, the croft land reverts to common grazing and the whole township stock graze indiscriminately over the crofts. Thus basically the whole area of the township, the individually held crofts and the common pasture, is common land, and it is clear that the agricultural revolution with its system of enclosure has not yet fully refashioned the Crofting Area.

Before 1900, there was a third element in the crofting landscape, the shieling (Gaelic - 'airigh'). The sites of the shielings are usually on slopes commanding a view of the surrounding area near a spring or stream and usually two to nine huts belonging to the same township are grouped together on a site; isolated shielings are rather rare. In order to conserve the pasture within the township dyke for wintering and to protect the unfenced crops, the cattle were removed to the hill early in June, and the younger members of the households went out to live in small stone or turf-walled huts to tend the cattle. The milk was either carried back to the township daily or made into butter or cheese at the shieling. The distance of shielings from the crofts varied from one to five miles in Park.

The affairs of the townships are managed by the Grazing Committee, elected triennially by the township and presided over by the Clerk of the Committee. The duties of the Committee in the past related mainly to the enforcement of soumings, but are now reduced to the disbursement of subsidies, although responsibility for the maintenance of the township dyke and the care of the township bull (usually lent by the Department of Agriculture but sometimes communally owned) are also the province of the Committee.

The layout of the townships varies with the topography but the majority of the crofts are aligned in strips from the moor to the sea (figures 4 and 5). Most croft houses are built on the crofts; in former times, the majority of the houses were sited on the poorest part of the croft as all the cultivable land was required for crops, but nowadays the houses tend to be sited near the road.

The official pattern of crofting is thus one of tenants, each living on his or her croft and sharing in the rights and duties of the township. Table I gives an analysis of the tenants of the 215 Park crofts. It will be noted that only one-fifth of the crofts are tenanted by those in the 15-44 age group: a similar proportion are tenanted by those over 65 years of age. Absentee tenants account for 14 per cent of the total. Women form under 10 per cent of the total, but only one in seven of the women tenants is the sole labour force on the croft. The intrinsic worth of the holdings can be inferred from the fact that two-thirds of the male tenants in the insurable age group take supplementary work, two-fifths of them furth of Lewis. With such a large proportion of the tenants either fully employed in ancillary occupations in Park or elsewhere it is hardly surprising that the theoretical township organization exists mainly in name alone.

Each croft, however, is not necessarily an agricultural unit; some are sublet by absentee tenants or by tenants who are too old or too infirm to work their crofts. Of the 215 crofts, one-fifth are wholly or partly sublet. In addition to the legal crofts, there are unofficial holdings which fall into three categories, cottars, squatters and feuars, all legally without grazing rights. A cottar[1] is a person, usually a close relative of the tenant, who builds another house on

These are the de facto definitions. Section 34 of the Crofters' Act of 1886 defines a cottar as follows:- "Cottar" means the occupier of a dwelling-house situate in a crofting parish with or without land who pays no rent to the landlord, as also the tenant from year to year of a dwelling house situated in a crofting parish who resides therein, and who pays to the landlord therefor an annual rent not exceeding six pounds in money, whether with or without garden ground, but without arable or pasture land". For fuller treatment, see Scott, J., "The Law of Smallholdings in Scotland," 1933, pages 152-155.

There is no legal definition of a squatter, and the above definition does not include any distinction between houses built on a croft and houses built on the Common Grazings.

427 241 a legal croft; a squatter builds a house on the common grazing, and a feuar pays a feu-duty or ground-annual to the proprietor. Such unofficial holdings with stock on the common grazing are "agricultural units" in the same way as the crofts, for in fact some cottars keep more stock than the crofters. In these classes are 84 families and 32 of them keep stock. Thus instead of 215 legal units, there are 219 working units[1]. The more usual situation in depopulated crofting areas, where the number of agricultural units is much smaller than the number of crofts, is certainly not prevalent in Park. The official pattern of crofting and the real pattern are very different indeed both in Park and throughout the Crofting Area.

Crofting Agriculture

241 433 By definition, the function of crofting is agricultural production. The small area of cultivable land, the poverty of the immature soils and the inhibiting characteristics of the climate, severely limit the range of crops. Of the 1838 acres of croft land in Park, less than 400 acres are classed as arable land. The measurement of the arable land was carried out about 1850 but reclamation after that date increased the arable area. Only in the townships of Shieldernish, Habost, Kershader (Figure 5), and Garyvard where there are deeper deposits of glacial drift, is ploughing practised; elsewhere cultivation is entirely in 'lazy-beds', a system of narrow ridges 4 to 6 feet in width, [246] separated by open drains, and cultivated by spade. Natural grass for hay is the chief crop, and and accounts for 52 per cent of the 638 acres of cropped land (See Table II). As only 400 acres of the croft land are classed as arable, some of this hay is taken from areas which were brought [244] into cultivation after 1850. Oats (26 per cent), occupy the largest cultivated area, followed by potatoes (13 per cent). The small area of sown grass (9 per cent) of which four fifths is cut for hay, is symptomatic of the low standard of husbandry: only one fifth of the agriculture units sow grass. The average cropped area per agricultural unit is only 3 acres and only one-third of the uni have gardens in cultivation. The hay and oats are grown for winter fodder, and the potatoes for household use. No detailed conclusions as to the use made of the crofts for cropping can be drawn, as the potential of each croft is extremely variable, but the low proportion of sown grass is indicative of the husbandry. There is a clear distinction between the 'agricultural' townships (Seaforthhead, Shieldernish, Habost, Kershader, Garyvard and Caversta), and the 'fishing' townships (Cromore, Marivig, Calbost, Gravir and Glengravir, Lemreway and Orinsay) in the extent and utilisation of the arable land: one measure of this distinction is that 55 per cent of the units in the agricultural townships sow grass; the figure for the fishing townships is only 22 per cent.

231 427 433 More valuable conclusions can however be reached from a study of the stocking. With the exce of Glengravir township, each croft has a defined soum, and thus the stock entitlement for each operative unit can be calculated. By using the equivalence, the soum can be converted to "cow units". In Gravir, the soum is 1 cow and follower, and 8 sheep per £1 rent: the equivalence is 1 cow to 5 sheep. The number of cow units per £1 rent is therefore 2.6; in the calculation, followe are ignored. The actual stock of the agricultural unit can also be converted to cow units and thus a comparison can be made between the soum and the actual stock of each unit. The percentage of the soum taken up can thus be used as an indication of the extent to which the unit is worked.

In the Crofting Area, as in all Highland Britain, stock rearing is the main function of agricultu [434] In Park, all the agricultural income, subsidies for cropping excluded, is derived from cattle and sheep.

1 Of the 215 legal units, 28 are sublet: thus if there was no unofficial stock-keeping by cottars and squatters there would be 187 agricultural units. However, there are 32 additional stock-keepers and thus in fact there are 219 agricultural units.

TABLE II

AGRICULTURAL TOTALS BY OPERATIVE UNITS IN TOWNSHIPS - 1958

1. A legal croft is any piece of land registered as a croft - a tenancy may consist of two or more crofts. There are 415 tenancies.

2. Cottars, feuars, squatters with stock.

3. An agricultural unit is defined as any unit, whether a legal croft or a number of legal crofts owned and/or sublet, or a cottar, feuar or squatter having stock. Agricultural units may include crofts in other townships worked from the home unit; the areas and sownings of such crofts are added to the township from which they are operated and subtracted from the township in which they are situated.

4. See page 5 for definition.

5. Some tenants in the townships of Beaforthbeg and Ehileldernish, Rahoat, Kershader, Garyvard, rent grazing in Park Deer Forest and therefore this stock is not related only to their respective Common Pasture Sownings.

6. Arable and outrun are not statistically differentiated; in the totals, the proportions of arable to outrun in the other townships have been used.

4. Figures in brackets are breeding ewes.

(p. 5-6)

Table III reveals that there are 177 agricultural units with a morning; ten units are crofts in Glengarnoch without a morning and the remainder of the 219 units have no grazing rights. From the Table, it is clear, that the stocking and overstocking increase with the size of the unit, the units of the acre and over, on the basis of stock carry, would appear to be the most intensively stocked. The Crofters' Commission has fixed the carry of a cow and her calf at 5 units, and of a yearling at 2 units. Based on similar or rich crofts in Ness and Barvas, it would appear that further ancillary employment sub-age is significantly related to the intensity of crofting. Table V points out that more full-time crofters appear are to be found on the larger units but that less than one in four of the younger and more active men are full-time crofters. Tables IV, IV and V underline the fact that the larger units are also the most intensively crofted. It is significant that the largest units are almost all in the barter land in the agricultural crofting area. It would appear that the crofter who is intensively crofting is also concerned with investment in style areas in the fishing industry, where the stock is much poorer and the cultivable area much more restricted.

The trends in agriculture are illustrated by Tables VI and VII. The Crofters' Commission made a survey of the crofts in Lewis through the medium of Estate Factors in 1951. The survey showed that in the parish of Lochs 1,620 acres were cultivated in 1928 and 1,130 in 1950. The decline in the acreage of selected tenantries was 1.2 as compared with 1:25 in 1950. Table VII gives agricultural statistics for the parish of Lochs (it is not possible to obtain a separate figure for Park over the years 1911). Cultivation in the crop and stock patterns have taken place; here (Hardman sighted) has contributed to a decline in the number of horses and cattle and a rise in the number of sheep in the trading crops. Horses have all but disappeared, and the cattle-sheep ratio has risen from less than 1:2 in 1912 to 1:3 in 1950. The decline in the number of cattle is a significant feature of the post-war period. Large areas of land, no longer cultivated, are also little-grazed by cattle and Hinger: assessed, the size span not for leashed cultivation, is no longer carried to the upper parts of the crofts. On the hill-grazing, a decrease in the number of sheep is evident.

From the foregoing account, it is clear that there are two major agricultural problems in Park, the lack of sufficiently large crofts with good arable land and no insufficiency of common grazing; the second problem is the ongoing in their trees the problem of overstocking and the decline of common holdings.

The more progressive crofters, significantly resident on the better crofts of the agricultural township, have shown how craft land can be improved by re-seeding and sowing down to grass, practicing modern crop rotations and generally improving the crofts. In addition, some crofters by co-operative effort, have reseeded the main areas of the hill-grazing, with varying success.

However it is clear that it is not possible for 219 crofts agricultural units to be maintained on the present crofting area. The optimum size of croft which could maintain a family is a moot point, for the rotation and situation of a croft and the quality of the land and common pasture would all have to be taken into account in making an assessment.

This problem was referred to a practical agriculturalist who was asked to state what size of croft and number of stock would be required to provide an annual income of £300, excluding croft benefit (milk, eggs and potatoes consumed on the croft) and any crofting fee labour. To fulfil these conditions, one of the fishing townships was carefully analysed, and the expert came to the following approximations; assuming that the value of good husbandry was to have after the croft labour, the crofting township and Commission, the expert proceeded to have carried out certain work on the croft and Commission, and provided there was no overstocking, and that present favourable schedules and prices continue:-

Size of croft: 4 acres arable. (3 in crop, 3 in sown grass), 18 acres cotton and rights in Common Grazing to carry:-

4 cows; 2 young cattle, 50 sheep, 12 wedders, 12 ewe-hogs and a ram.

Income	£	Expenses	£
Sale of 1 cow, 3 calves, 18 ewes and 12 wedders, 12 ewe-hogs	224	Rent, rem.-service of bull, grazing, etc.	20
Sale of wool	11	Turnip seed, manures and lime dressing	40
Subsidies on cows, calves and cropping	141	Excess of income	316
Total income	376		376

In order to work such a croft efficiently, the tenant could not take regular ancillary employment and would require the services of a family at home periods. If such holdings were formed in the particular township studied, the number of crofts would have to be reduced to almost one third of the present number. Even then, the income from the agricultural crofts would have to be reduced to half of their present value. The full-time crofter would be a thing of the past, as it was based on general estimates. It is clear, however, that about 100 crofts could be maintained on the present crofting area if the crofters were willing.

From a detailed study of the agriculture of Park one can only conclude that the present crofting population is not in a position to maintain itself. Only congestation on a major scale could make crofting economic, and the congestion would be in the wrong place. The problem of the non-crofting crofter is the problem of the crofter who is not in a position to maintain himself on the profits of ancillary industry are discussed on page 12. Larger crofts might well evolve as a result of continued depopulation. In the meantime, a determined effort should be made to the benefit of re-seeding and pasture improvement, and to consolidating the existing non-adjacent pieces of certain crofts. Further, the sheep stocks, with an emphasis on quality instead of quantity, and the introduction of some cattle, surveying the present 1:25 cattle-sheep ratio, are policies which could be followed with profit.

ANCILLARY OCCUPATIONS

In most crofting areas, ancillary employment is necessary to compensate for the low croft income and dependence on the croft for a livelihood has never been characteristic of many crofting areas except in Lewis and Harris. Ancillary employment has been a feature of crofting since last century and has been particularly important in the Lewis District. Tourism and not being in the trade in the Highlands of Scotland for people who are willing to journey far in search of a quiet holiday usually conducive to local observance.

Unless new sources of employment are brought to Park, it is clear that ancillary employment must continue to be sought elsewhere. The higher "spending standard" in industrial employment, and the opportunities to find entertainment in urban areas Dealer often resulting from experience during school days in Stornoway or National Service), militate against a large population of young people, but basically lack of employment and the uneconomic nature of the crofts are the real reasons for the high degree of temporary and permanent employment away from Park.

Type of Ancillary employment

The question of the desirability of ancillary employment in a crofting district is often considered. Ancillary employment is considered desirable if it keeps the crofter at home and makes the croft more productive, but it is undesirable if it takes the crofter away from his croft and makes the other hand, crofters who take ancillary employment are better able to make capital investment, and the amount of assistance to the croft which can be provided by ancillary employment is not significant. Further ancillary employment sub-age is significantly related to the intensity of crofting. Table V points out that more full-time crofters appear are to be found on the larger units but that less than one in four of the younger and more active men are full-time crofters. Tables III, IV and V underline the fact that the larger units are also the most intensively crofted. It is significant that the largest units are almost all in the barter land in the agricultural crofting area. It would appear that the crofter who is intensively crofting is also concerned with investment in style areas in the fishing industry, where the stock is much poorer and the cultivable area much more restricted.

TABLE XVII

SELECTED POPULATION STATISTICS FOR THE AGRICULTURAL AND FISHING TOWNSHIPS

Table XVII reveals that there is little difference in the stocking between the agricultural and fishing townships. The former are characterized by a more stable population trend, and significantly by the number of permanent employment away from Park. The fishing townships are, on the other hand, crofters who take ancillary employment are better able to make capital investment, and the amount of assistance to the croft which can be provided by ancillary employment is not significant. Further ancillary employment sub-age is significantly related to participation in ancillary employment. If young people are to be encouraged to remain in the crofting townships, a closer relationship between income desirable, those who wish to work the croft on a full-time basis might be given full use of the croft and be provided with a fair share of the income from the ancillary employment which could also not be charged for their houses. It is clear that the agricultural resources of Park are insufficient to maintain the present number of crofts as viable economic units but the problem of finding ancillary employment for any large non-crofting population is very great.

The Park Association, in their task search to attract industry, met with little response for high rates. The Chairman of the Crofters' Commission has recently suggested that the Chairman of the Crofters' Commission has recently suggested that the Chairman of the Glasgow Corporation Transport Department, Mr. Alexander Mackenzie, "an opportunity is present in the West Highlands and Islands" but even with Government grants for the establishment of industry, the present crofting area is not in a position to maintain the present population.

One possibility is that the fishing industry might be revived. In 1950, 16 large motor fishing vessels belonging to Stornoway Crofters and Carloway Crofters, left the Park and never remained." only one has ever still fishing in 1958. The recent Fishing Board Scheme provides a grant of £1,000 for a new boat, and a loan of £2,000 for the boat. It brings out the guarantees a minimum livelihood. The major problem is the finding of the initial capital outlay, which is, in the case of a modern boat, in the order of about £70,000. Eight-five per cent of this sum can already be found in the form of grants and loans from the fishing industry Board. The remaining £10,000 is a big sum for the Park Crofters to find, and it would be a pity if the Park crofters were to be left out of the sheep stocks, with an emphasis on quality instead of quantity, and the introduction of some cattle, surveying the present 1:25 cattle-sheep ratio, are policies which could be followed with profit.

Tourism is an industry hardly developed at all in Park. Lack of running water has made it difficult to attract visitors to the Park. Only one chalet is available for visitors, and it is only declare who are delighted to accept inexpensive accommodation away from the crowded resorts. The Park is not on the Clachan of the Outer Hebrides[4], stance that this fact has made the Island Islands prosperous, and believes that tourists on simple interests be successfully developed in the Outer Hebrides. Tourists need not bring in to train the description of the Sabbath for people who are willing to journey far in search of a quiet holiday usually conducive to local observance.

Unless new sources of employment are brought to Park, it is clear that ancillary employment must continue to be sought elsewhere. The higher "spending standard" in industrial employment, and the opportunities to find entertainment in urban Areas Dealer often resulting from experience during school days in Stornoway or National Service), militate against a large population of young people, but basically lack of employment and the uneconomic nature of the crofts are the real reasons for the high degree of temporary and permanent employment away from Park.

[Ber-Forthbad] [Ber-Forthbad]

expression of the original township appeared to six Indian. As a result, many large-bale, now grass over to natural grass, are being gradually encroached on by heather and bracken. Out of the 1,620 acres cultivated in the parish of Stornoway Parish, one is presumed to be in Lewis and Harris, the remainder in the Outer Hebrides, the Lewis Parish, with a large number of stocks. Vegetation's power: there is no bracken or cover and within the crofts, mainland grasses and lower grasses are found, and the Highlands are not. Bracken is a problem in the mainland sheep and cocks foot. On the hills heather predominates.

In Scalasthwhad and Shiadebrosh all settlement is below the road and house-sites are on small elevations. In Scalasthwhad is the reputed landing place of the Seaforth's, "Seaforth Castle", and the ruins of a castle are still visible. Communication was by boat, 1920. Now a cart-track, Ferry-point, Carloway, Lochs. Communication was by boat, 1920. Now a cart-track, Ferry-point, Carloway, Lochs. Ferry-point, Carloway, Lochs. Ferry-point, Carloway, Lochs.

[Scots]

[Translation]

Of the 32 residents: 19 are over 65 and only 8 under 15 years, leaving a working population of 25, seven are in permanent employment elsewhere. The population has been steadily declining, from a peak of 121 in 1861.

Since 1956, the township has changed considerably. It has been completely fenced and the common grazing has been divided into 12 crofts. Some of the crofters have cultivated their allotments and have built a new croft house and byre; a lamb pen and hoist have been erected; an increasing area has been put down to ley. It would seem that lottering of stock for market is intended, and better grazing for more stock is anticipated. Nevertheless, the crofters are not all young men, and many are part-time crofters. The population is thus larger and more stable than it was in 1956, but it is a figure below the real carrying capacity of the grazing. The croft could become a profitable unit, but, as yet, the croft is only maintained through grants and part-time employment. It is doubtful that hopper, however, there must be more re-seeding and an increase of cultivation to provide winter fodder.

KESSDALE

Philip W. Wheeler, M.A.

Kessdale is a township of forty-five crofters' holdings on thirteen crofts, which attach to the Kessdale Estate of Highland Scots E310 Park. The crofts extend up to one-third of a mile from the shore with a three-and-a-half mile deep blocking of tenant grazing. The extreme elevation is 270 feet and the average from 125 feet to 175 feet, but the crofts, mostly arranged by township, are all at right angles to the coast, are never longer than 1,000 feet and vary in breadth:

(a) From the low cliffs of the shore to the road, approximately, a zone mainly below 75 feet, 2 crofts have cultivated allotments. The soils of the grazing part of this zone are sandy, and the stationary profile and tend to be moderately heavy, wet, and smutted in fertilization by manure. The winter fodder is thus here thinner stalks of the same kind with poor growth. In the main fold (crofts 10/11) is an extension of zone (b).

(b) Mid, about 4 weeks are spent on the common grazing between the ring fence and the new inter fence erected in 1957.

(c) Hill, about 2 weeks are spent on the common grazing between the ring fence and the new inter fence erected in 1957.

(d) Return to the crofts for the winter, being let out either to the park or to the common. Grazing whatever the weather is suitable.

The township stocks yearly much of their flock on the outer common grazings. As most of the crofts, the crofting with one in 1938 and ending in sequence with 15, 11 and 12 probably in 1959. Are herded, the crofters are not permanently resident on the crofts. Only 3 of the 45 are. The 3 are: Crofts 10, 11 and 12, irregular in disposition, have a steep coast line with greater slopes over 30 feet, crofts 1 to 9, steep slopes for parts of some 150, and crofts 13 and 14 have a steep coast line with slopes, are intermediate (Fig. 3).

In Kessdale, there are thirteen legal crofts and twelve operative units. The crofts vary between 4.4 and 18 acres, with a maximum of 1 acre reported in the common grazing. The average croft is 8.4 acres, and the average croft is 8.4 acres, and the average croft is 8.4 acres, mainly mixed grass 6.32, and 0.5 acres under other uses, and the remaining 95.5 acres, mainly mixed grass

[Scots-Gaelic]

with heather and peat on the higher areas, bay is taken off 15 25 acres. Four acres, mainly for the common grazing, are in the hands of the Kessdale Estate. Crofts 1 to 9 have cultivated allotments, and the crofters are common and in some cases are carefully resort, but the winter fodder is thin stalks of the same kind with poor growth. In the main fold (crofts 10/11) is an extension of zone (b). The soils have been developed of 15.6 percent. The only crops are rare and positive, the winter fodder is thin stalks of the same kind with poor growth. The township stocks yearly much of their flock. Winter on the croft, with a maximum of 1 acre reported in the common grazing for earlier. There is no memory of Black Face (Gaelic: [illegible]), and have therefore [illegible]

[Calbost] [Gravir] [Glengravir]

The present situation in Calbost is best illustrated by reference to the population statistics. There are only 17 people living there at present, seven of whom are squatters and only eight houses are occupied within the dyke. Of the male population, there are three children under fourteen years, one man in the 15-44 age group, three between 45 and 64 years and two over 65. This clearly shows the lack of active men from 15-44 years, necessary for the continuing economic success of the community. However, even these figures are not so striking as the numbers of emigrants as no less than 39 men and 40 women have left Calbost since 1939.

A community of 120 persons has shrunk to less than 20 in only twenty years as the younger people have left to find employment in Stornoway and on the mainland. The present population structure seems to indicate a continuation of the downward trend.

GRAVIR AND GLENGRAVIR

Gravir, the largest Park township numerically in population and crofts, lies astride the major east-west inlet of Loch Ouirn, a glacially modified line of structural weakness. The size of the township is perhaps the most picturesque in all Park, but the steep slopes, lack of cover, the small area of good arable land, and the considerable population existing on slim resources, problems common to Park as a whole, are all epitomised in Gravir.

On the south-facing-slope above the loch and the continuation of the trough in the valley to the west, the majority of the crofts have been carved from moor to sea, some before 1800, and some in the process of the abolition of rundale which was accomplished in the nineteenth century. Originally, there appeared to have been thirty crofts, but four were added during the nineteenth century, two at each end of the line, and in 1934 a further fifteen were cut out of the common grazing, a mile to the west of Gravir. On the south side of the loch, the 'clachan' of Tom an Fhuadain, established about 1800, has since developed into a further nine crofts. Thus there are forty-three legal crofts in Gravir and a further fifteen in Glengravir making fifty-eight in all.

The layout of Glengravir, a line of crofts from 3.6 to five acres, typifies the small post-1918 Department of Agriculture holdings. The arrangement of the Gravir crofts is illustrated in Figure 4, and it will be seen that not all the crofts are consolidated. There are three areas of former arable commons which have been lotted in unfenced strips and they may well be reclamations which were necessary to supplement the food producing capacity of the holdings. The method of division and allocation speaks of a period when a subsistence economy under severe pressure from over-population necessitated fair shares for all. The last of these commons was in cultivation until 1891. Although subsistence crofting has been obsolete since then, there is as yet no move towards a regularisation of the layout.

The congestion which necessitated the reclamation of the arable commons developed mainly as a result of a successful fishing industry which prospered from 1860 to 1914 and at one time there were two curing stations in Gravir. With relative prosperity from an ancillary industry, cottars were landed and the population rose from 197 in 1830, to 368 in 1881 reaching a peak of 448 in 1911. The collapse of the industry after 1914 began the downward trend which has certainly not yet ceased. Gravir reverted from 1918 to a township of agriculturalists and a base for employment in the herring fishery although there have been spasms of successful fishing activity since.

Stock raising is now the function of the township and the agricultural resources and conditions are hardly conducive to the development of economic holdings. The Gravir and Glengravir crofts vary between 3.5 and 26.5 acres in size: no croft has more than four acres of 'old arable'. In the days of subsistence agriculture, and indeed until the 1930's, cultivation, all in narrow lazy-beds, banked up with stones at the downward extremity on the steep slopes, was much more extensive. All the cultivable land was at one time under crop, heavily manured with seaweed cut as far away as Cromore or the coast south of Kebock Head. About one-third of the maximum lazy-bed area is now cropped and the more inaccessible areas of the crofts have reverted to pasture; some of the lazy-

[Gravir] [Glengravir]

beds are now covered by sphagnum moss and heather. Other lazy-beds are permanently in natural hay: only thirty per cent of the land classified as 'old arable' is now in oats and potatoes. If natural hay is added, one hundred and thirteen acres of crops are taken from an area greater than the so-called old arable; this suggests that the cultivated area was pushed beyond the limits of the old arable (ninety acres) after 1850-52. As in all the fishing townships the area of sown grass is infinitesimal: the only four of the fifty-eight operative units actually sow grass. The wintering capacity of the crofts could be greatly increased by the general adoption of the practice of under-sowing.

There are forty-three legal crofts in Gravir but nine are sub-let, in every case to relatives. All the crofts are taken up and there is evident pressure of population on the land. In addition to the crofts, there are a further ten cottars, and squatters and feuars, besides the fifteen legal Glengravir crofts (ten operative units) which have no share in the Gravir common. The common has been encroached on by several feus for Gravir is the functional centre of Park: the Free Church of Scotland and Manse, the doctor, one of the two district nurses and two of the missionaries (assistant ministers) are all located in Gravir.

Gravir and Glengravir thus have fifty-eight legal crofts and fifty-six operative units. Less than half of the crofts with grazing rights are fully stocked and one quarter have under fifty per cent of the sum, including five without any stock. The common pasture of 2,652 acres is in general of poor grazing quality, dominated by the less nutritive species of grass and poorly drained. In 1957, a ten acre plot was fenced and re-seeded: only twelve of the operative units participated in this reclamation work, and the sown grass yield amounts ranged between 27 and 58 years: this is significant as tenants are unable to carry out such work. This scheme could be extended without limits. Re-seeding on a large scale would enable better stock to be kept rather than greater numbers; at present the sheep stock is over two hundred per cent of the consequences of over-stocking. The lamb sale for as little as £2 10s to £3 10s, an indication of the paucity of cattle is one of the notable characteristics of the first stocktaking. The sheep stock is over two hundred per cent of the consequences of over-stocking. The cattle stock is below the stocking and this paucity of cattle is one of the notable characteristics of the agriculture since the 1930's for at that time as many as six cattle were kept on the larger crofts. The total stock kept in Gravir and Glengravir exceeds the stocking by thirty-five per cent.

The great majority of the crofts can certainly not be considered economic units. Judging from the stocking of one cow and follower and eight sheep per pound sterling of rent in a township where only seven crofts pay more than £2 rent, they were never intended to be self-supporting agricultural units. The produce of two cows and sixteen sheep, with potatoes, and in former days, bere or oats, locally ground via the communal meal mills, could scarcely ever have maintained a family. The crofts were supplemented by the three Gravir lobster mills, and in 1901 no fewer than nineteen boats of eighty-nine fishermen were registered at Gravir. Today, only one boat fishes commercially for lobsters.

If agriculture is singularly unrewarding, weaving occupies six of the males of insurable age and service occupations a further ten males and five females, but neither weaving nor service occupation are sufficiently available or attractive to keep the insurable population in the district. Twelve of the males between fifteen and sixty-four years take seasonal employment and forty-six are in permanent employment furth of Lewis, in all sixty per cent of the potential male resident population.

The economic problem of Gravir, in common with the other 'fishing' townships, became acute after the fishing industry collapsed after 1914; in the hay-day of the fishing boats of the men fished all the year round, locally and on the west and east coast of Scotland. Earnings fluctuated but a man might make as much as £90 in a good year or as little as £5 in a poor year. Apart from the sale of young cattle, and wool surplus to home spinning requirements, the fishing earnings constituted the bulk of the croft income. Today, on the basis of the souming, the income of the crofter including subsidies could only be approximately £150 excluding the amount to be set aside for home consumption of potatoes and milk.

1. Cutting. 2. Carting. 3. Planting. 4. 'Earlies' and mid-season potatoes. 5. Main harvest. 6. Spreading. 7. Harvest. 8. Lambing. 9. Shearing. 10. Lambs weaned. 11. Dipping. 12. Tupping.

FIG. 9

/facing p. 31/

[Gravir] [Glengravir] [Lemreway]

The urgent need in Gravir is a reduction in the number of holdings. A pre-requisite of such reorganisation would be the creation of employment for a non-crofting population. Weaving and crofting are the more obvious occupations; the former is subject to world trade fluctuations but the latter is now in a more favourable position since the introduction of the herring fishing guaranteed subsidy, although the raising of the initial capital for buying and equipping boats is a formidable problem. It is clear that a division of the community into a crofting and non-crofting sector is essential if the present population level is to be maintained. The most serious aspect of the present trend is that the migrating section of the community comprises the younger and more enterprising people. Unless holdings of economic size can be formed, and stable employment introduced, one can expect the younger men and women to remain in Gravir.

Until a major reorganisation of the crofts is carried out, a vigorous attempt to re-seed large areas of the common pasture and the three former arable commons, and the development of a croft-tourist industry, are interim possibilities. It is not sufficiently realised in crofting districts that there is a demand from the city dwellers for simple accommodation and good plain fare in a clean atmosphere, with the possibility of hill walking and fishing on from and a moderate scale can hardly be contemplated. proposed water-scheme becomes a reality, tourism on a moderate scale can hardly be contemplated.

One can only conclude that until reorganisation takes place and transforms Gravir into a township of viable agricultural holdings, any stabilisation of the present trends is out of the question. A decline in the number of holdings is inevitable in the long run but a planned reduction over a number of years would bring about a more viable community than the disintegration which will occur without such planning. Until this is achieved, the young men and women have little incentive to remain in Gravir.

LEMREWAY

Beth Blowers, Brenda G. Turner
and John E. Wearmouth

Lemreway, the southernmost township of Park, comprises 290 acres arable and outrun divided into thirty-three crofts and 3,625 acres of common pasture. The township is situated on the northern side of Loch Shell round a bay in the lee shelter of Eilean Iuward.

The township consists of three distinct areas. A flat, poorly drained area at about 100 feet, forms common pasture and part reclaimed as sixteen crofts, locally known as 'the Outend', forms the first subdivision. The second area, further west, is of a hummocky nature. To the east, a steep slope rises to an altitude of 400 feet, less than half a mile from the loch shore, forming the third. Two benches are to be seen at about 100 feet on the steeper slope and similar, though wider terraces occur at the same height to the north. It is suggested that the flat area is the bed of a moraine-dammed lake, and that the hummocky sector in partly morainic and partly ice-eroded rock exposure. A channel eroded through this sector allowed the lake to drain southwards leaving a relatively deeply incised valley through which the present stream flows to the sea.

Soils may be divided into two types - a peaty loam and the better drained gravelly loam which is found to the east and along the main stream; the latter is particularly suitable for potato cultivation.

Except on rocky outcrops, the very steep slopes and the drained areas, blanket bog predominates. Sphagnum here is rarely dominant but where the land is badly drained Deer's hair grass (eriophorum vaginatum) and cotton grass (Eriophorum angustifolium) are the dominants. On slightly drier land purple moor grass (Molinia caerulea) and common sedge (carex nigra) are abundant. Local dominants are bog asphodel (Narthecium ossifragum) and cross-leaved heather (Erica tetralix) with other common species such as the sundews (Drosera rotundifolia and intermedia), butterwort (Pinguicula vulgaris), Juncus sp., Carex sp. and Carex panicea occurring sporadically. Where the peat has been cut and drained, 'heather moor' usually develops and Calluna

[Lemreway]

vulgaris is dominant. Ling, which can tolerate considerable soil wash, occurs on the shore, and a few Molinia, Scirpus cespitosus and Eriophorium. A few rowans, usually near the shore, and a few willows, usually within stone enclosures, are the only trees to be seen.

Of the thirty-three legal crofts in Lemreway, nine comprise less than five acres, while seventeen are between five and ten acres. Of the remainder, only two exceed fifteen acres and one of these is 30 acres. Six unoccupied crofts are worked by persons other than their tenants, so actually the 290 acres of croft land are shared by twenty-seven holdings. The seventeen-acre 'outend' was originally divided between fifteen tenants but confused sub-letting has resulted in four separate holdings directly occupying nine acres, and working another four acres. Thus the outend today must be regarded as the monopoly of four 'unofficial' holders.

Little more than a quarter of the croft land is cultivable and even less is actually cultivated today: Figure 5 illustrates the cultivable crofting year. The broken terrain and the stony nature of the soil permitted the cultivation of tiny 'layabeds' and lazy-beds, where the soils are deeper, are now cultivated at least two acres the strips of land on the gentler slopes, where the soils are deeper, are now cultivated at least two acres croft shows signs of at least, natural hay is cut on the well-marked layabeds at about 225 feet. For example, on the east side, natural hay is cut on the well-marked layabeds at about 225 feet.

Oats and potatoes, 29.5 and 16 acres respectively, occupy almost all of the cultivated ground. Most crofts grow about half an acre of potatoes and one acre of oats; both acreages have declined. The former with a declining population and the latter with a reduction in the numbers of cattle; ha has increased in importance. No bere is now grown, though before 1900 it was preferred to oats. Ruins of the bere mill, which ceased to function at the beginning of the century, can still be seen. Fifty-nine acres of natural grass are cut for hay but only four crofters had sown grass for hay in 1958, about three acres in total. Few vegetables other than potatoes are grown though carrots are said to grow well, and formerly turnips and cabbages were grown. The soil needs careful prepa to be productive and almost every crofter used some seaweed and at least twenty drew subsidies and artificial fertilisers in 1958.

Stock totals have declined recently but the township has 36 cows and 22 calves. Only one cro is without cattle and 22 of the 33 working units have a cow and a calf. The township has an Ayre bull on lease from the Department of Agriculture; one of the few remaining elements of the co-op township system is that this animal is fed by the crofters, in rotation, during the winter.

All but two crofters keep sheep; stocks vary between ten and 120 per holding but the major have about 23 ewes with ten lambs. Although numbers have declined recently, the 3,625 acres very moderate common pasture support a flock of about 1,150 sheep, including about 650 breed ewes and about 300 lambs.

The souming is not enforced in Lemreway and it is remarkable that the total stock tallies exactly to the souming. An examination of the sheep stock reveals that the stock of 917 (exclu lambs) considerably exceeds the sheep souming of 628. It is interesting that it is nearly 50% working units of over 10 acres but not of overstocked; of twelve such units, eight keep more they are entitled to. Most of these crofts are grouped on the eastern side of the township whe crofts have a larger outrun.

Thus, while overgrazing is not so severe as in many townships, it represents a potential particularly if the common pasture is not improved. However, in 1958 ten acres of the comm pasture have been enclosed and two acres with pelletted and inoculated seed. The eleven c two acres with pelletted seed to help drain and aerate the peaty soil. It is interesting that in the scheme put on 100 tons of sand to help fertiliser, grades 1 and 2 - a making part in the scheme put on 100 tons of concentrated compound fertiliser, grades 1 and 2 - a ground mineral phosphate and 2 tons of concentrated compound. There was a striking diff by hand. The area was sown in May 1958: by the following August, there was a striking diff between it and the untreated pasture. Next Spring, eleven cows will be grazed on this area. success of this scheme, it is hoped that more of the crofters will co-operate in re-seeding areas.

[Lemreway]

The West Highland Survey Township Card[1] describes Lemreway as "predominantly a fishing township". The remains of an old curing station are visible today and until 1947 there were twelve boats operating from Lemreway. A declining market, increasing cost of gear for obsolescent boats and the lack of a landing stage led to the decline of the industry in this township. Today there is one fishing boat which lands its catch in Stornoway; working with modern equipment, drift and ring nets, it provides a regular income for a crew of six.

An examination of the population statistics proves interesting, especially when compared with those for Orinsay. Lemreway's resident population of just over 70 males and 70 females is large considering that there are six unoccupied crofts. Eleven of the crofts have more than one house and the cottar population forms over a third of the total residents. More than two-thirds of this resident population is in the two important age groups - between 15 and 64. With over forty resident males in the working age group, Lemreway provides a striking contrast to other crofting townships in Park.

Fourteen of these men are full-time croft workers, while nine others find work in ancillary occupations such as weaving and fishing. A further eight supplement their croft work with regular employment - a postmaster and a postman, a bus driver, a lorry driver and several weavers. Just over thirty people work away from the township permanently, fourteen in the Merchant Navy and nine girls in domestic service, while a further nine engage in seasonal work.

Emigration from the township has continued steadily with forty people leaving since 1939. Nevertheless, Lemreway has a larger proportionate resident population than most townships.

Only four thatched houses are occupied and housing conditions generally are good. Every house has electricity, but, with four exceptions, water has to be carried from springs and wells. Most of the present houses were constructed in the 1930s and they are usually near to the road. Ruins of the old houses remain, some being used as byres, and these were built either along the shore or up the slope in the shelter of the hills, where the house was near the sheep, the peat and the springs. Today supplies of food, peat and even seaweed are brought by road.

Mention must be made of the possibilities of the tourist trade in Lemreway with its most attractive situation and reasonable road connections. An approach has been made to the Scottish Youth Hostels Association and while hostelleys could not greatly increase the income of the residents, they would stimulate interest in the area. Accommodation for summer visitors, other than relatives of the crofters, is difficult to find but it seems that at least three houses could be used.

It is possible to be optimistic about the future of Lemreway, as at the moment considerable enterprise is being shown. A Ferguson tractor, bought this year by a man returning from whaling, is an example. It is to be hired out and could be put to good use in some parts, especially on the mutend. The attempt to improve the common pasture and the new extensions to neatly painted houses all reflect a combined effort to improve conditions. The old economy of crofter-fisherman is being adapted to modern times and crofter-weaver, crofter-postman and crofter-bus driver are the contemporary employment combinations.

The pessimism and apathy noticed in many crofters is to be found in Lemreway but above this is the impression of enterprise. If Lemreway can continue to adapt itself to changing conditions, it may be able to combat the 'drift to Glasgow' and continue as a successful community.

ORINSAY

Beth Blowers, Brenda Turner and John Wearmouth

Orinsay is a small crofting township clustered, in the form of a horseshoe, around the head of a sheltered bay on the northern side of Loch Shell. Most of the houses are situated within fifty yards of the shore on a narrow strip of level land, while the crofts extend from the shore on to the moor

1. The Directors of the Crofting Survey are grateful to Dr. F. Fraser Darling for granting access to the individual Township Cards, which are a storehouse of information. For detailed contents of the cards, see West Highland Survey p. 247.

[Orinsay]

which rises steeply, exceeding 375 feet in the west and 150 feet to the north and east. From the north-west and north-east two glacially deepened valleys drain southwards, their lower ends being "drowned" by northward extensions of the loch.

Although peat covers most of the surface it is only in the hollows that it is significantly deep, for even on the gentler slopes the peat cover is frequently so thin as to expose a layer of morainic sub-soil containing many stones and boulders.

Two rowans and a dozen willows represent the only tree growth, but tree stumps frequently exposed in peat-cuttings suggest that woodland was formerly more evident. Whether this former woodland disappeared as a result of human action or of climatic change it is not possible to say, but it is certain that a century of overgrazing has not favoured natural regeneration. Moorland grasses, sedges and a little poor heather characterize much of the area, and reflect the poor grazing capacity of much of the moorland. Bracken has established itself in one limited area on a patch of neglected croft land.

Orinsay is unique in Park, for the present township is entirely a twentieth century development. In the early 19th century there was a settlement at the head of the loch, but in 1843 the residents were removed and the area enclosed and added to Crobeg sheep farm. In 1916, there was a proposal to establish fourteen crofts, but the applicants were requested to wait until after the war. At the end of the war the return of many young men with a desire to settle down led to serious overcrowding in Lemreway. Several of them 'raided' the Orinsay area. At first living in huts, they built their own houses, and in 1922 the Department of Agriculture intervened, recognising and fencing off fourteen legal crofts, and at the same time providing a good footpath. Seeing the success of their neighbours, four other Lemreway families, comprising 26 people, went to Siemreway, about a mile to the west of Orinsay. Here, however, the Department of Agriculture did not intervene and with the community remaining isolated, most of the settlers returned to Lemreway within three years, although one family remained until 1939.

Six of the crofts have an area of less than ten acres, six have between ten and fifteen acres, while the remaining two occupy eighteen and twenty-five acres; the largest croft originally belonged to the shepherd on the sheep farm. Three of these crofts are not occupied, although worked by other crofters, with the result that eleven operative units share 161 acres.

Only a small part of the croft acreage is actually cultivable: even less is cultivated in practice. The broken and rocky terrain combined with the peaty soil allows nothing but the cultivation by spade of tiny lazy-beds. The total area now cultivated does not exceed 25 acres, although in the past it may have been nearer 40 acres.

Oats and potatoes are the staple crops, occupying 9 and 6½ acres respectively in 1958. Individual croft acreages of these crops vary in relation to the requirements for winter stock-feed, and in the case of potatoes, to domestic consumption. Nevertheless to produce even these meagre returns the soil requires careful preparation. A plentiful supply of seaweed is obtained from the shore and is the most frequently used fertiliser, while a little sulphate of ammonia is applied. Only two crofters use lime.

In the last two decades a marked reduction in the amount of oats grown has accompanied a decrease in the numbers of cattle and an increasing use of hay for fodder. Nevertheless only about 17½ acres of hay altogether are cut, and only five of the crofters sow any grass seed.

In August 1958, the township supported only 13 cows, 3 young beasts and 8 calves. Half of the crofters have a cow and a calf, but three have no cattle at all, and one even used condensed milk, a sad commentary on the state of crofting in Orinsay, but a phenomenon by no means uncommon in crofting areas.

[Orinsay]

The future existence of the common pasture for grazing is being seriously endangered by overstocking. The souming is not enforced in Orinsay and the actual sheep stock exceeds the soum by 300 per cent. Peat-cutting is gradually destroying valuable grazing areas; in the last three years there has even been some peat cutting on the better grazing on the island. The dangers both of overstocking and of indiscriminate peat cutting cannot be overstressed.

No evidence was seen of attempts to improve the quality of the common pasture. The establishment of shelter belts would provide not only shelter but a means of stopping the peat from 'slumping' down slopes if they were carefully sited. Much of the common pasture could be improved by a hill drainage scheme and by re-seeding, after sanding and liming, a project well within the capacity of the resident labour force.

Good crops on a few of the crofts suggest that the land is not inherently sterile, however, and it would seem that if the holdings were reduced to a maximum of four, an economic existence might be feasible on these crofts. The stony nature of the soil limits the possibilities of tractor cultivation, but with an improvement in drainage, one might be used in the two valleys.

It is not so easy to be optimistic about the employment of surplus population resulting from such an enlargement of holdings, although a revival in the fishing industry could absorb most of the men. At present there are no looms in Orinsay and providing the Harris tweed industry can hold its own, there are possibilities in weaving. Seaweed is in plentiful supply, indeed Lemreway people also obtain supplies and should its quality prove adequate, the establishment of a processing plant would provide valuable employment.

Nevertheless it is becoming increasingly obvious that unless the holdings can be enlarged, whether officially or by sub-letting, and some further employment created, Orinsay is liable to stagnate, and depopulation to continue. The township which was developed to relieve congestion is now itself congested.

SUMMARY AND CONCLUSIONS

The aim of the Glasgow University Department of Geography Crofting Survey is to record and analyse material relevant to the crofting districts, and in so doing provide a clear and impartial statement of the present situation. In inviting us to undertake a survey of Park, the Pairc Association hoped that a body of fact would be assembled and conclusions drawn which would assist the Association in their admirable aims of advancing the well-being of the area. Their two Progress Reports, of 1956 and 1957, indicate that they have already investigated many of the possibilities for development. This summary refers to Park alone, and, it must be emphasized that until the survey of crofting is completed, no final assessment of the Crofting Area as a whole can be made.

The district of Park is one of the more isolated and difficult crofting environments. The ruggedness of the terrain, the high proportion of land of very low agricultural value and sheer isolation make the existence of human communities precarious. In addition, many of the Park communities were first established as a result of population pressure in more favourable areas of Lewis, and the original small settlements grew rapidly as a result of a change in land use which was a national trend - the conversion of poorer areas from subsistence farming to an extensive sheep-rearing economy. The impact of this change came to Park in the form of the eviction of a large body of small farmers in favour of an extension of the grazing area. Thus the present conditions are a legacy of the relatively recent past, and of legislation, particularly in the Crofters' Act of 1886, which accepted, and tacitly agreed to the maintenance of a larger population than the land could reasonable carry[1]. Two World Wars and fluctuating economic factors have had repercussions in Park and resulted in a change in economic and social values, and depopulation has resulted: the 1951 population was 60 per cent of the 1911 total.

1. The Commissioners proposed that only holdings rented at £6 and over should have security of tenure, with a view to discouraging the perpetuation of grossly uneconomic holdings; in the Act, all holdings were given security of tenure.

TABLE XVIII

Occupational Structure of Park compared with other Crofting Districts

Males 15-64

Figures in brackets are percentages

	Park	Benbecula and South Uist	Barra	Waternish (Skye)	All Districts
Fulltime Croft work	71(18.0)	231(18.7)	44(6.6)	14(17.1)	360(15.1)
Croft work with regular employment	76(19.0)	197(15.9)	54(8.2)	7(8.6)	334(14.0)
Croft work with periodic employment	14(3.5)	117(9.4)	60(9.1)	17(20.7)	208(8.8)
Non-Crofting employment	29(7.0)	288(23.2)	90(13.6)	5(6.1)	412(17.4)

Permanent Employment furth of the district	125(31.5)	220(17.7)	353(53.5)	28(34.1)	726(30.6)
	399(100.0)	1240(100.0)	660(100.0)	82(100.0)	2381(100.0)

121 a wider applicability of my thesis. The evidence in support of
101 my assertion was collected on the culture history of the Isle of Skye, a part of the area known as the Highlands and Islands of Scotland.

101 Since I shall frequently speak of the Highlands and Islands in the following pages, we should have a precise definition of the
133 region (Figure 1). Geographically, the Highland boundary should be placed at the Great Highland Fault, a series of geological faults which extend across Scotland from the River Clyde to Stonehaven, south of Aberdeen. Politically and economically,
43 however, this line has receded to the north and west. Since 1883 it has been common in Scotland to equate the Highlands and Islands with the "Seven Crofting Counties," those counties in which the
241 predominate form of land use is the crofting system. Crofting may be defined as a system of hereditary tenure of a few acres of arable land combined with common tenure of hill grazings.
634 These counties are: Argyll, Inverness, Ross and Cromarty,
632 Caithness, Sutherland, Orkney, and Zetland. Out of the 163 parishes in these counties only 12 are considered non-crofting.[1]
161 In addition to this shared socio-economic pattern, the seven counties have experienced common economic-geographical influences, a century of accelerating population growth, followed by a century of persistent depopulation.

---

[1] Adam Collier, The Crofting Problem: A Social and Economic Study (Cambridge: Cambridge University Press, 1953),
794 p. 11n. A parish in Scotland is an ecclesiastical district which until 1929 was also a civil unit with self-government in such local affairs as education, relief for the poor and infirm, and health. If the British county is thought of as analogous to an American state, the parish can be thought of as a county, but one devoid of any function.

132 50 inches. The rest of the Island normally receives about 60 inches a year. The yearly variation is usually only 10 percent on either side of average; rarely is it as much as 20 percent. In northwestern Trotternish, for example, for the period 1944-1947 the annual rainfall was 51.04, 60.80, and 46.72 inches, respectively.

The important factor is the detrimentally high effectiveness of the rain. Falling as a slow drizzle, the rate of evaporation is extremely low, because of the mildness of the climate and the prevailing cloudiness. Furthermore, the rain has an unfavorable distribution. A well-distributed rainfall would mean that the spring growing season was moist enough to promote growth and the autumn harvest season was dry enough to facilitate ripening and work in the fields. On Skye the wettest months are September
132 through January. The driest are March, April and May. The
241 difficulties of securing the harvest are aggravated by the constancy of the rain. The harvest season of 1953 was marred by
132 59 consecutive days of rain. One man who was acquainted with the experience of the American troops in the Aleutians, an equally wet archipelago, during the Second World War at length asked if the Americans had taken over Skye. Actually, the pattern has been characteristic over the years. Even for the driest part of Skye in one of the driest years, 1947, the plague of incessant rain was marked. Of the 46.72 inches, 19.3 fell in September, October, and November.

The Island, then, is humid and cloudy. Hours of sunlight are few, only around 25 percent of possible. In spring and

well recognized relation of culture and environment.[9]

The economic foundation for the present day culture is commonly referred to as "the crofting system," a system of hereditary tenure of individually held small patches of cultivated land combined with communal use of grazing land. On his small plot, typically under five and seldom over ten acres, the crofter grows a little oats and hay for his stock, a few potatoes for his family and dairy cattle, and, in some cases, a few garden vegetables. Anyone who is acquainted with the Irish small farmer will recognize the underlying similarity of the two systems.[10] The communal element in the crofting system on Skye, however, is a distinguishing feature. In addition to his croft, the individual has a common, concurrent right to a share in an extensive area of grazing land. Here he keeps a couple of cows and a score or two of sheep. After the harvest, the stock are frequently brought down from the hill and allowed to indiscriminately graze the arable land of the crofters who share the communal lands. Thus, the efficient economic unit is not the croft, the few acres of arable land, but rather a "township," a collection of crofts and the common grazing lands. The system differs from the runrig system which prevailed two centuries ago only by the holding of permanent, compact blocks rather than dispersed and shifting strips of arable land. It is a unique survival in Europe.

[9]See, for example, Kroeber, Cultural and Natural Areas of Native North America, p. 6.

[10]Cf. Conrad M. Arensberg and Solon T. Kimball, Family and Community in Ireland (Cambridge: Harvard University Press, 1948), pp. 5-7, 31-35.

The labor in this pastoral-agricultural economy is provided by the crofter's family, periodically aided by some or all of the families who share in the common grazing.[11] Under the direction of the father, the mother and children care for the crops and cattle. Heavy work, such as ploughing, reaping, and feeding the cattle in the winter, is left to the men. The women milk the cattle, help at the harvest by raking and stacking, and care for the garden. Although men never do any work in the house, in the absence of a son the wives and daughters are expected to fill in the gaps in man's work in addition to running the household. Inter-family cooperation centers on the handling of the sheep. Frequently, the families who share the common own the sheep collectively, as a "club stock," and share in the expenses and profits as well as the labor. The only basic pattern in the division of labor is that women never shear, and it is their responsibility to feed the group.

Formerly, the annual economic cycle was adjusted to the demands of crop cultivation and cattle breeding. Within the last hundred years, however, sheep have assumed commercial importance and now determine the seasonal tempo of labor. The old year ends and the new begins with the bringing in of the rams from the hill. In March the sheep are dipped and then the preparations are made for the lambing season, in April. From spring until autumn there is a rapid succession of duties: ploughing, planting, peat cutting, dipping and shearing the sheep, stock sales, harvesting, and similar tasks. After the

[11]Cf. Ibid., pp. 63-64, 70-74.

of the tacksmen. Here was the essence of the clan system, t
common tie of territory and kinship. The land was not the m
means of subsistence, it was the ancestral home.

The clan was strongly patrilineal. The father of the
individual family stood to his children as the senior member
of the derbfine to his kinsmen, the tacksmen to his followe
and the chief to the body of the clan. The fundamental und
lying principle was mutual, reciprocal devotion. The system
was equalitarian. Although the chief was the landowner, and
the tacksmen received their land on lease, for which they ow
the chief the duties of service and a rent just as their
tenants owed the tacksmen, the land had no commercial value.
Rent was an ill defined and secondary consideration. The di
of the clan depended on the number of supporters, who could
be maintained on the land under the system of land use.

Economic Activities

The principles of land use and tenure on the Isle of S
up to the early years of the eighteenth century were similar
those prevailing all over Scotland.[59] The land was used unde
system of runrig agriculture. The word runrig appears to be
modification of the Gaelic roinn-ruith, a parallel or runnin
division. The bulk of the population, as tenants of the lan

Century (London: Faber and Faber, Ltd., 1953), pp. 34-73, 91

[Marivig] [Calbost]

000 In conclusion, it may be said that the problem of Marivig's future, and that of other crofting townships, is not only one of adverse aspect, soil and weather conditions, and of distance from markets, but a problem of the population finding a stable and viable level where agricultural units are large enough to encourage the active and enterprising section of the population to remain, and a problem of finding capital to equip a modern fishing fleet.

CALBOST

Anne Cooper

Calbost is situated five miles to the north-east of Gravir on the Minch coast of Park. It occupie a basin-like hollow in the centre of which is Loch Dubh, and is open to the sea on the east. The croft houses are scattered over a shelf 50 feet above sea-level round the sides of the hollow and along the valleys which enter the township to the north and south-west.

The cultivable soil, a mixture of peat and well-drained gravelly drift, is on the higher ground, although here the rock outcrops in many places. On land formerly cultivated, bracken is spreading rapidly and now covers a large proportion of the surface, although twenty to thirty years ago it was unknown. Heather dominates the common pasture and rushes are widespread in the low-lying central area. There are a few willows and rowans round the old buildings, probably planted as wind-breaks.

Calbost was originally a single farm but the township was formed about 1820. The pattern of the crofts differs from the usual shore-to-dyke alignment, as six crofts were allotted extra land in the valley which enters from the north, when a part of the common grazing was brought within the township dyke. There are now fourteen crofts of which four are worked by resident crofters and two by squatters. The remainder are used only for hay and grazing and are sub-let to crofters in Calbost and other townships.

Cultivation is entirely by spade and of the 2.6 acres now in cultivation, potatoes account for 2.37 acres. The small acreage of oats reflects the greatly reduced cattle stock of only two cows ar two calves. Approximately twelve acres of hay are cut as winter feed for the 225 sheep which graz in the township.

The lazy-beds in natural hay and the outrun are being rapidly encroached on by bracken. The prevalence of bracken, and the amount of work needed to clear it, is likely to deter any attempt at renewed cultivation.

Calbost was originally a fishing township in spite of its harbour being so exposed: boats have to be taken up on the shore instead of being moored in the bay. The decline of the fishing industry whi has prevailed in Lewis has contributed towards the almost complete desertion of Calbost, leaving only a few boats now used only for leisure purposes. Croft income is supplemented by only two of the men in the township, one a weaver and the other in the Merchant Navy. Although there are a fe productive gardens, no attempt is made to market any produce.

The township dyke is very close to the settlement and in the past shielings were not so widely us in Calbost as elsewhere. The cattle were instead brought near to the dyke for milking and allowed to graze on the common unattended. There are ruins of shielings to be found on the hills around Calbost but a more interesting feature is the second dyke; enclosures were made adjoining the mair dyke and in the late summer the cattle were brought to fresh pasture within these dykes before the opening of the township gates. Following the opening of the gates the stock are free to wander over all crofts but there seems today to be a move towards the complete enclosure of the crofts.

241 182 [434] [464] An examination of the agricultural situation reveals that there are insufficient resources to make the present number of crofts viable. Overstocking in sheep, an attempt to increase cash income, has resulted in a high mortality rate, and consequent losses. The tenant of a small croft is faced with a classic dilemma. If he puts all his efforts into the working of the croft, the area of potential arable land is insufficient to maintain a large stock and even if the best rules of husbandry were operated, croft income alone would be insufficient to provide a reasonable living. The fishing industry, formerly the chief means of a livelihood rather than the croft itself, has virtually disappeared, and he is forced to find ancillary employment in an area where little exists and thus migration in search of employment is the only solution. The croft becomes a base for non-agricultural activity and a means of providing produce for home consumption rather than an effective agricultural unit. On the larger crofts, it is clearly possible to make a living if sufficient additional grazing in the non-crofting area is available - the agricultural townships, especially Seaforthhead, Shieldernish, Habost and Kershader, which comprise units sufficiently large and fertile, bear out this contention. Yet better husbandry is possible, and reclamation of the common grazings for improved stock rearing has started. The agricultural townships as a whole are better favoured by situation, soils and communications, and appear to possess a much greater degree of stability.

288 484 463 Since the decline of the fishing industry, the fishing townships have progressively declined. Income from weaving has replaced earnings from fishing as a means of combining croft work and ancillary employment to provide a living, but, as has been pointed out, the supply of weaving contracts is not regular and greatly depends on the state of the world market. The present centralisation of the Harris Tweed Industry in Stornoway is not favourable to the Park weavers: the suggestion by the Park Association[1] that a spinning mill be set up in Park would certainly help the local weavers.

464 [166] [167] [162] If the present number of agricultural units and level of husbandry on them is to be maintained, ancillary employment on a large scale will continue to be necessary, and, as weaving and the service occupations alone certainly cannot provide it in sufficient quantity, temporary and regular employment furth of Park is bound to continue, and as this grades into permanent migration, the population must continue to decline and age. The capacity of the area for tourism is also limited. With the overheads which branches of parent lowland factories would have to face, the establishment of manufacturing or assembling employment is also unlikely.

228 A revival of the fishing industry holds out most hope but must take place before all the accrued skill has disappeared with the older generation of fishermen. The fishing grounds are within reach of the modern £20,000 boat: by co-operation between crews, fish could be taken to mainland markets such as Ullapool as indeed happens at present. Lobster fishing could be integrated with herring and white fishing. Such a combination of several types of fishing would ensure a more balanced economy and the Herring Subsidy would be a guaranteed element of income. It must be agreed that if mainland boats do come to the coast and sea lochs of Park, there seems little reason why local boats could not also be successful.

000 As far as the land is concerned, the survey leaves no doubt that improvements in husbandry and pastures are definitely possible. Yet, until viable agricultural units have been created, there is little incentive for large scale improvement in either sphere. It is an expert's opinion that no crofter working on a croft in Park which would bring in £300 a year would have time to engage in ancillary work and at the same time fully work his holding in accordance with the rules of good husbandry. If this opinion is accepted, and if it is also accepted that such crofts are desirable and the present successful crofts in the agricultural townships where there is a higher proportion of full-time crofters than elsewhere would bear this out, it follows that ancillary employment on such units would have to be ruled out.

1. Park Association Annual Report, 1956.

000 The reduction of the present number of agricultural units then becomes desirable. There are two ways in which this could come about; firstly by continued depopulation, but amalgamations con sequent on such an uncontrolled run-down of the community would lead to scattered holdings; such is the experience of other depopulated crofting districts. The second point to be made is that if overall planning were possible, it would be desirable for holdings to be amalgamated as they becor vacant as a satisfactory rearrangement of the townships would then follow.

Concurrent with such a policy would be the aim to create distinct crofting and non-crofting groups. Employment for the non-crofting section of the community, be it fishing or weaving, wou first have to be assured. As has already been stated, fishing would appear to offer the best prosp while tourism could play a minor role in providing an opportunity for the enterprising crofters' wife or non-crofting household. One problem above all remains, the maintenance of an overall viable population. A certain minimum level of population is essential to maintain the operation of local transport, post office, educational and medical services. Such considerations suggest that further research is necessary to assess the optimum number and structure of population which a district such as Park could reasonably support. In the same way, a detailed examination by an agricultural expert is desirable, in order to assess the number of economic holdings which could be supported on the land of each township.

In conclusion, it is clear that, short of unexpected industrial employment becoming available Park and unless major reorganisation of the present agricultural units and communities is carrie out, the present population trends must continue. However, if such radical changes cannot be contemplated, then considerable improvements in the standard of husbandry, the re-seeding of croft out-runs and common pastures, and the fencing and general improvements of the crofts are possible and will increase agricultural productivity. Until there are some radical changes, the present pattern of the most enterprising members of the community engaging in ancillary employr which takes them furth of the district, and the serious degree of permanent migration to Stornow and the Scottish Lowlands, will be maintained and increased.

APPENDIX A

PARK IN COMPARISON WITH OTHER CROFTING DISTRICTS.

462 464 241 Table XVIII gives an analysis of the occupational structure of the male population of insurable age in four crofting districts studied by the Crofting Survey. In all four areas, a considerable proportion of the insurable population is not resident in the crofting area for more than an annual holiday period. This proportion varies in relation to two main factors - the viability of the crofts and the availability of ancillary employment within the district. South Uist and Benbecula stand out as the districts where such permanent absences are least marked: the crofts in these islands larger and more employment is available. In Barra, there are few large agricultural units and, in Park, the decline of the fishing industry has led to economic disaster in many townships. Few than half of the men in this age group are fully resident in Barra. Park is in many respects comparable to Waternish (Skye) for both districts are isolated and have experienced serious depopulation. (see Table XIX).

It is a significant fact that in none of these districts are more than 20 per cent of the male population solely engaged in full-time croft work, and this is a measure of the inability of the croft to support a family without ancillary earnings. The amount of permanent employment available varies from district to district; in South Uist and Barra there are minor service centres which ar urban in character and 23.2 per cent and 13.6 per cent of the respective insurable males are engaged in non-crofting employment on these islands.

[166] [167] It is clear that the occupational structure of these four crofting areas is far from stable for ov one-third of the potential labour force is away for all or part of the year. It is also clear that basically the absence of sufficient natural resources, coupled with the varying degrees of isolatio from the industrial centres of Scotland, are the root causes of the present position.

[Cromore] [Marivig]

butchers' vans call on Wednesday and Friday and a fish van once or twice during the week. Goods are also conveyed by the daily bus. Electricity was brought to the village about four years ago and the inhabitants now look forward to a supply of piped water in about two years' time. At present only three or four houses have bathrooms.

The crofts, when worked well, are good enough to provide the existing population with a satisfactory subsistence, but each family unit must have some additional source of income. It seems that the recent subsidies for fishing are good enough to attract fishermen from Cromore and one or two boats might be sent out from the bay if the quay were longer. Weaving has brought prosperity but, as the Park Association states in its Second Progress Report "there is not sufficient weaving available for the present number of weavers". The proposal to establish a spinning and processing plant in the Park District made in the 1957 Report, would undoubtedly be of great value to the people of Cromore. The village is sited in a most picturesque spot and one of the inhabitants suggested that a hotel built on Crobeg Farm would bring some benefit to the community. However, even if these three increased sources of income became effective, one wonders whether they would be sufficient to attract the younger generation, already urbanised by schooldays spent in Stornoway.

MARIVIG

Pamela Gough, B. A.

Marivig is situated on the western and south-eastern sides of Loch Marivig, a small triangular sea loch opening to the north-east and sheltered from storms and swells by Torray Island, making the loch an ideal anchorage and harbour.

The land rises steeply from the shore of the loch for twenty-five feet to fifty feet, then slopes more gradually and irregularly, with frequent precipitous rock outcrops, for two hundred to five hundred yards to rise steeply to a line of low hills, two hundred and fifty feet to three hundred feet high, surrounding the loch. All crofts thus have an easterly or north-easterly aspect, not particularly favourable for agriculture, and only one has any appreciable area of level land uninterrupted by rock outcrops. Soils, derived from glacial drift, are unevenly distributed, thin, and very stony, and cultivable areas are thus small and widely dispersed.

The surrounding hills, which form part of the eight hundred and sixty-three acres of common grazing, are mainly covered with heather, moor grass or sphagnum bog, while the lower areas within the township are grassy, but drainage is poor, and rushes are widespread. Bracken is not yet a problem, and only small areas exist, mainly on the lower slopes of the western side of the loch. A few rowans and willows survive here also, but otherwise the area is devoid of cover.

There are twenty-four registered crofts in Marivig, twenty-two being inhabited, one vacant and worked by another crofter, and one worked from a house on the common. With the exception of two crofts, one of which is on the common, all the boundaries run from the township dyke, which closely follows the two hundred foot contour, to the sea in radial fashion (Fig. 4). The size of the crofts varies from 1.25 acres to 22.25 acres but only seven crofts and less than four or more than eight acres in size. No croft has more than three acres of land which has ever been cultivated, and few now cultivate more than one acre. There are thirteen cottars and squatters, five houses being on the common, three of them cultivating small areas adjacent to their houses.

Cultivation is exclusively by spade on the 'lazy-bed' system. Owing to the rocky nature of the terrain, the 'lazy-beds' are narrow, often only one or two yards wide. Potatoes and oats are grown in rotation, and hay taken from lazy beds left fallow. Very few crofters sow grass for hay or undersow their crops. Dung and seaweed are used as fertilisers, with potato fertiliser as the most general 'artificial'. Small enclosed gardens, often somewhat neglected, produce lettuce, carrots, cabbage and soft fruits on about half the crofts, but no garden produce is marketed.

Man hours, twelve men using the *caschrom* were able to turn one acre in a day, roughly the equivalent of the work of one plough team. A man working alone could plough enough land in a day to sow a peck of oats or half a peck of barley. The yields from land prepared with the caschrom were about 16:1 for barley and 5:1 for oats compared to 12:1 and 3:1, respectively, on ploughed land.

While cooperation was an accessory when using the *caschrom*, the heavy four-horse plough required cooperative effort. The operation took four men, each of whom supplied a horse. One man held the plough; another led the horses; a third went ahead to remove thistles and stubborn weeds, and a fourth followed after to lay down the clods of earth. Frequently, a *raskan*, or clod breaker, a rake-like implement with six stout wooden teeth had to be used to break heavy clumps.[62] On heavily overgrown land a small rigtle plough, a light machine with a sickle-shaped coulter, had to be used before the soil would yield to either the plough or the *caschrom*. After ploughing, the land was harrowed with a wooden implement with two rows of wooden teeth and a heather brush. The harrow was drawn by a man harnessed with a horse hair rope or it was simply tied to a horse's tail.

To facilitate drainage the rigs were heaped up high in the center with soil from the ditches on either side and were ploughed lengthwise to allow natural seepage. The result was that the lower edges were soured by stagnate water while the crown was leached and often excessively dry during the early growing

[62] James MacDonald, General View of the Agriculture of the Hebrides (Edinburgh: Sillvester Doig and Andrew Stirling, 1811), p. 151-157.

175 241 season.[63]

After ploughing, the infield was covered with sea weed. Some used old house thatch, mixed with dung, but there was a belief among the Skye folk that grain from on thatch caused jaundice if made into griddle cakes. The outfield received no manure. After three years's use, it was left fallow for seven years. Oats were sown in April or May and barley in early June, using the worst of last year's crop for seed. A rotation of barley, oats and oats was general; oats sown on newly ploughed land were believed to cause internal disorders in those who ate cakes or crank ale made from them.

The rigs were left untouched from sowing to harvest. There was too much else to occupy a man's time. Until 1650, and no doubt later, cattle forays and interclan wars kept them busy. The peat for the household for the following winter had to be cut. The cattle were moved to the higher grazings and shepherded. Droves of cattle were taken to the southern markets. Fishing took a great deal of the man's time. Seeds, regarded as a consequence of Adam's fall, were not only untouched but pains were taken to leave them standing at the harvest. Except for a few earthen dykes, there were no enclosures. Animal depredations were common. One remedy practiced on Skye was to bring the depredating cattle to the limit of the field and draw blood from each of them.

The harvest was late, normally in September and October on the few dry days. Oats were cut by men using a sickle.

[63] Cf., e.g., Hamilton, op. cit., p. 57.

175 241 Barley was pulled by the roots. The oats were either stored in a byre or built up in a stack near the house to be used as needed. The process of dressing was known as *gladden*. A woman took a handful of stalks and set fire to it. As the husks burned, she beat the grain with a flail, a stick or bunch of heather. Using *gladden*, it was possible to dress, winnow, grind, and bake the oats into cakes within an hour. Kilns came into use in the late seventeenth century, but kiln dried grain was considered inferior to grain prepared by *gladden*. A few water mills had also been built at the close of the century, but they were also unpopular. The barley was stripped from the stalks, which were used for house thatch, and ground in a stone mortar for griddle cakes or, later, for whiskey. The rye, like much of the Oats, was used as porridge.

175 241 **Stock and Its Improvements.** The Skyeman, in contrast to the 231 233 Lowlander, was primarily a pastoralist. The stock included a small, hardy, shaggy breed of cattle well adapted to the rough terrain and excessively wet and windy climate, a small, narrow framed sheep of limited value for meat or wool, ponies, goats, and pigs. The importance of the cattle may be judged from the valuation of the farms. Although the Horse system of land measure had replaced the pre-Feudal Scottish measure known as a *davach*, the amount of land required to support ten head of cattle, with a monetary measure of merk lands, which were divided into penny lands and smaller units based on

[64] John Cameron, op. cit., pp. 170-171.

to the health of the potato and their own fertility.[40] Many men turned to fishing, on a part-time basis, but once again the initial success was short-lived. Others supplemented their diminishing incomes from the croft by seasonal employment in the Lowlands. Crofting had ceased to be a subsistence economy; the people had lost their self-sufficiency. Nor were they ever again able to escape from a dependence on some form of supplementary income to provide the bare essentials of life. The difference between conditions then and now is that the pressure of the population on the means of subsistence increased until it approached a Malthusian ceiling.

175 178 241 427 233 241 In the thirties epidemic and famine began to take their toll. Destitution became widespread and there was no system of relief beyond the moral obligation of the proprietors to provide grain. The marriage rate fell. In Kilmuir the average annual number of marriages fell from twenty-one to six. Subdivision was forbidden, but it was too late. In two districts of Kilmuir there were 190 lots, crofts, and farms to support 421 families in 1840. In all of Skye, after the emigration of at least 1500 people, there were 1900 crofters and 1531 cottars. Despite the fact that oats had become as big a luxury as meat and the fact that many were living on potatoes and fish, the population continued to increase. By 1841 it reached 23,074. Finally, the economic structure collapsed.

175 178 241 427 233 241 427 233 241 In the autumn of 1846 there were no potatoes. A blight destroyed the entire crop. Although the famine was universal

[40] For details concerning the plight of the crofters at this time, see MMI, pp. 218-260.

175 178 427 233 166 167 425 162 166 quarters without any legal hold on the land. In Duirinish parish, which includes Glendale, only twenty-one families had enough land to meet even subsistence needs.[62] In one Glendale township, Holmisdale, some crofts of four to acres had as many as fifteen people to support.[63] Part of this extreme congestion was due to the continued practice of subdividing one's croft when a child married. Although the population in 1831 had fallen to 17,660, from 23,034 in 1841, almost every township had two or three times the number of families which had lived in them in 1841.[64]

175 178 427 233 241 The loss of the summer shielings and the common grazings meant few could keep sheep.[65] The looms were silent. Since the rent continued to be based on the value of livestock and was wholly or partially paid from the sale of cattle, all oats, which the graziers' sheep did not eat, went to feed the cattle. The mills were all but idle. The people had to buy flour, meal, and bread imported from Glasgow. Almost all were heavily in debt to the local merchants, who seem to have been newcomers with more associations with the graziers than the crofters and cottars. Milk became a precious commodity. Frequently, the old cow had only enough for her calf. Unable to keep horses, the women became beasts of burden. They carried

[62] Ibid., p. 112.

[63] Alexander MacKenzie, op. cit., p. 419-420.

[64] Smith, op. cit., p. 317; Cummings, op. cit., p. 140; and Napier Report, p. 17.

[65] The following is drawn from the evidence presented to the Napier Commission by the crofters and cottars of Skye; see Napier Report, Appendix 1, pp. 1-82.

175 178 427 233 241 241 the dung from the byre, the peats from the moor, and the oats from the fields. When the land had been turned by *caschrom*, they yoked themselves to a harrow. The crofters, in Kilmuir, as elsewhere, lost the right to the rivers for fish, to the moors for game, and to the coast for sea weed. The land became exhausted from over tillage. They had clung tenaciously to the old methods. Even if they could have obtained credit and could have broken with the ways of their forefathers, the fear of rackrenting would have deterred them.

175 178 233 241 341 A degree of preciseness can be given to this general picture by comparing the arable acreage and stocking of Skye in 1810, the year graziers first appeared, and 1870. In 1810, 30,000 acres were listed as arable, either cultivated or susceptible to it; there were 18,000 cattle and 40,000 sheep.[66] By 1870 no more than 8,383 acres were considered as arable; there were only 9,341 cattle, but there were 136,077 sheep. The magnitude of this change can be emphasized by adding the fact that there were less than 14,000 sheep on the Island at the turn of the century.[67]

175 178 584 241 163 The end of the shieling life brought an end to the traditional season for courting. Destitution forced a postponement of marriage and an absolute reduction in the number of marriages. As a natural consequence the birth rate declined. In the decade 1861-1870 the birth rate of Skye stood at 26.1 compared with 34.9 for Scotland.

[66] James MacDonald, op. cit., pp. 748, 754.

[67] Ibid., II, 553; III, 247; IV, 131; XVI, 148, 225, 537; XVIII, 164.

175 178 427 233 166 167 425 162 166 241 241 241 341 wealth, rose above the indigent crofters and cottars.

These changes had a pronounced effect on the culture and the population. Economic hardship and evictions prompted emigration, forced many men and women to seek seasonal work away from home, and led to a reduction in the marriage rate. Crofting which had already become part-time agriculture now was a spare-time pursuit. The *Sgiathanach* was dependent on money, on the wider economy, for the satisfaction of most of his needs. The croft was providing no more than a few potatoes for the table and some oats for the cattle, the crofter's only export. Still, no landless working force appeared. Portree had grown and there was a woolen mill, but there does not seem to have been any marked movement into the village by the crofters.

175 178 427 233 166 167 425 162 166 241 241 241 341 While much of what was meaningful to the people was being lost, the religious Revival continued. The conservatism of the "Men" became an official policy of a new church. The emotional approach of the ministers and the "Men," who were now elders in the church, and the emotionalism of the large outdoor meetings functioned to restore the social disequilibrium.

Although the extended family, township, and nuclear family suffered from instability, the people found intelligible roles within the religious sphere of activity. Their religion was reinforcing their way of life. The abhorrence of much of the old culture was accompanied by a strengthening of many traits which reaffirmed the desirable status values. The culture found a new focus in congregational religion and was able to maintain a continuity while the content changed.

sanction and endowed with privileges and immunities by which self-regulation, stability, expansion, and improvement might be attained. Additional provisions called for the replacement of the repudiated customary usages by national laws of land tenure.

The Crofters' Holdings (Scotland) Act of 1886 embodied many of the Commission's proposals. The crofter became, perhaps, the only class, as a horizontal segment of the population, within a minimal legal definition. He was a pastoral agriculturalist who resided on his holding, the annual rent of which was less than £30, (Later raised to £50) in a crofting parish. Such an individual was entitled to a fixed, fair rent, just compensation for improvements made by himself or his predecessors in the same family should he leave his holding, security of tenure, and modified right to bequeath the holding to a member of his family. Except for the statutory conditions that he must not alienate the holding from his family, sublet without consent, or violate the rights of his neighbors or his landlord, including withholding rent and contributing to the deterioration of the land and dwelling, the crofter was given all the privileges of a landowner with few of the responsibilities. A Crofters Commission, with executive functions, was established to carry out the provisions of the act and to assign "available" land to the townships as

[80] I owe a debt of gratitude to innumerable government officials in Portree, Edinburgh, Glasgow, and London for their patience and cooperation in providing me with the necessary information to discuss this final period of the history of Skye. The facts are theirs; the interpretation is my own responsibility.

enlargements when the proprietor would not lease it on reasonable terms. Thus, the government began to protect the crofter from potential abuse and to restore the land to the descendants of the clansa, who had, to say the least, manifested a persistent disinclination to accept any other system of land use. A complete reformation, however, was not yet possible.

The crux of the problem of maintaining the crofting population was succinctly stated in 1851 by the chairman of the Highland Destitution Board. The people could not support themselves, at a subsistence level, unless each crofting family were given ten acres of arable land plus pasture. Not only was there not enough land, but without credit facilities, a man could not find local employment until the land began to produce, and, if he sought employment at a distance, he could not work his land to free himself from the necessity of working for a wage. In 1883 it was estimated that a 50 percent reduction in population would not leave enough land to give each family an adequate holding, ten acres of arable and 277 acres of grazing land.[81] How right they were. Today the population is less than half that of 1883, and still very few have what was considered an adequate holding a hundred years ago. Let us see what measures the government took in the attempt to solve this problem.

At first the land reorganization program was thwarted by a lack of available land and by the continued tendency of

[81] Napier Report, pp. 100-101.

the people to overstock. No land could be assigned as an enlargement if it would impair the value of a sheep farm or deer forest. The remainder of the island was already possessed by crofters. Moreover, there was no one to regulate the use of the common grazings. As the Crofters Commission usurped the functions of the landlord, estate management became lax. The township constable had disappeared. The cotters, 36 percent of the population, had been omitted from the provisions of the Crofters Act. Later when the government provided for a grazing committee to draft voluntary regulations for sharing the common grazing and, finally, coerced the crofters to elect a grazing committee, the regulations could not be enforced, except by appealing to the sheriff.

At length another commission of inquiry visited the Highlands to decide how the resettlement program might be extended. Then, in 1897, the Congested Districts Board was created. The Board was given power to purchase land for enlargements and for creating new holdings, to resettle crofters and cotters from congested districts, to foster the development of stock breeding, agriculture, fishing, and home industries, and to improve communications. It was not intended that the government should become a landlord. The crofters, like the Irish small farmers, were supposed to have acquired a desire to own their own land. In 1904 the estates of Glendale, the present twelve townships, and Kilmuir, the whole parish and part of the parish of Snizort, were purchased. On the Kilmuir Estate there were 450 crofts in 35 townships and 10 large farms.

heavy rackrenting in the past had led to dissatisfaction and arrears in rent, the crofters' weapon against the landlord. The rents were revised and most of the arrears were cancelled. All the farms but one were subdivided to form 79 new holdings in 7 reorganized townships and to make enlargements to the other townships. The Glendale estate received similar treatment, being made over into 147 crofts in 12 townships plus a jointly held club farm. Both estates were sold to the crofters on a fifty year annuity basis. Then came a rude awakening. Within ten years the crofters found ownership to be a dubious privilege, especially since it excluded them from the benefits of legislation favoring the small tenant. The Kilmuir crofters were released from the contract, but the government refused to accept the petition of the Glendale people, who still are not pleased with their rather unique position. Private ownership of the land might be said to be as alien to their heritage as village settlements.

Land settlement continued, with the introduction of certain refinements, the most important of which was the power to use compulsion to acquire land for crofting in the national interest. Today over half the Island is owned by the national government and administered by the Department of Agriculture. The tendency in recent years has been to create more adequate holdings. On the Kilmuir estate the number of crofts has been reduced from 530 to 442. The process of resettlement, or de-commercialization, has been carried further on Skye than in any other Highland area.[82] It has also included the only major

[82] Cf., e.g., Collier, op. cit., pp. 90-113; and Hance, op. cit., pp. 61-62, 64-65.

migration scheme to be attempted. In 1923 sixty-eight families from the Isle of Harris, in the Outer Hebrides, were brought over to Skye and settled in Braeadale. Probably, close to 300 new holdings and in the neighborhood of 200 enlargements have been made since 1897. This clearly reflects the limited space available for crofting at the end of the "Clearances."

In addition to land settlement, the government has continued to stimulate improvements in stock breeding techniques and to foster more efficient land utilization. Credit facilities, grant and loan, were offered to enable the crofters to purchase stock, especially sheep, and to build new cottages. Grants and subsidies, in an ever increasing number, have been made available to promote a fuller use of the land. Initially, under the Congested Districts Board, these facilities were devised specifically for the Highlands. By the time the Congested Districts Board was abolished, the crofters had become officially integrated with the national agricultural scene so that specific subsidies, grants, and loans were replaced with an opportunity to apply for assistance within the national program of agricultural development. Instruction in scientific methods of agriculture has been another continuing function of the government through a series of advisory services and, more recently, by a program of demonstration crofts and farms. Access to markets has similarly been facilitated by improving communications by land and, to a lesser extent, by sea.

Security and protection for the crofters has been another unfailing interest of the government. Again, with official integration, the scope of legislation has been extended to

include all small tenants in Scotland. The landlords have lost their right to evict a crofter for breach of conditions. Since 1911 only the Land Court, which replaced the Crofters Commission, can remove a tenant who is guilty of bad husbandry. Moreover, such action can only be taken after the general circumstances of the crofter and his need of the croft for a home have been considered. To date, no Highland crofter has been removed. In fact, security of tenure has been carried to the extreme that the individual no longer has to reside in Scotland much less on his croft. Although this change is now regarded as inadvertent, the courts have ruled in favor of the small tenant. The only remaining functions of the landlord in estate management are to collect his rents and pay compensation should a tenant desire to leave. Both the rents and the compensation are determined by the Land Court.

Accompanying the integration of the Island with the national scene, politically and economically, were extensions of social services. Prior to 1872 education was the responsibility of the church, charitable agencies, and, especially in the Highlands, the local proprietors and their financially secure tenantry.[83] Although the parish school system was national, the administration of each parochial school was local. The ideal of a school in each parish was neither adequate nor easily obtainable. The result was a few regularly taught schools.[84]

Summary: The Cultural Trends

During the Fourth period, in which the crofter re-emerged as the characteristic feature in the social and economic aspects of the culture, all the influences necessary for a readaptation to the wider socio-cultural level of organization were functioning for the Gaidhtanach.[92] These influences were the presence of potential exports, access to markets, credit facilities, and a gradually improved technology. Several of these go far back in the local history. Cattle were being exported in the sixteenth century, being received by the clan chief and his tacksmen as partial payment for rent. Access to markets was available by the droving trade, but the subsistence economy precluded dependence on imports. Credit in the form of loans to the clan chiefs, on security of the clan territory, could be obtained, but it was directed to the support of the dignity of the clan rather than to agricultural improvements. At the close of the first period of the modern era sheep became commercially important. By the third period men with capital and the incentive to adopt new techniques were replacing the indigent tenantry. Communications had been improved. Access to markets by road, rail and steamship replaced the old drove roads, which would not serve for sheep. It was not until the government stepped in to halt the process of commercialization of the land, however, that the Gaidhtanach was given an opportunity to directly benefit

[92] I am indebted to Julian Steward for the point of view which follows. Those who are familiar with his conclusions on cross-cultural regularities will discover many correlations between the cultural trends on Skye and those described for Puerto Rico.

CHAPTER V

THE ISLANDERS' ECONOMY

241 427 The basis of the local economy, in terms of the contribution of the Sgiathanach to the national economy and the number who depend on the land for all or part of their livelihood, is the crofting system. We must, therefore, explore 241/427 the economic aspects of this cultural pattern in detail. As 427 171 a system of land use and tenure, crofting is an anachronistic survival in Western Europe. Elsewhere, the medieval agrarian systems have been repatterned along four principal lines.[1] In central and some parts of northern Europe peasant proprietorship became the characteristic feature. In southern Europe the métayer, a peasant who paid a rent plus a share of his crop, appeared. Northern Europe became an area of large farms. In England and Lowland Scotland tenant farmers received most of the land. There is only one survival of the 241/427 old open field village farm in England.[2] Despite individual efforts of Highland landlords to bring about at least a partial assimilation of the increasingly backward economic patterns with those of rural Britain, crofting has been perpetuated. Certainly, the legal enactment of 1886 helped to

grazing clerk and committee. They determine the number o
cattle, sheep, and horses the individual is allowed to pu
to graze. Usually each crofter has an equal share, but

*175 been more or less autonomous and self-sufficient. Significantly,
[103] the names of these farms, as most place names for lochs and headlands, are Norse.[60]

*175 Crops and Their Care. The crops of Skye were essentially
24 those introduced during the Neolithic.[61] The staples were oats and barley. The local varieties were unproductive in comparison to the varieties common in the Lowlands, but they were regarded as better against the wind and rain than the more productive grains. A little flax and hemp was grown, but not enough for local needs. Only the chiefs and a few tacksmen had kitchen gardens; most of the people grew no vegetables.

Although cultivation was of secondary importance, it was basic to the economy. The land was prepared by a large and cumbersome four-horse plough or a small foot plough. The foot plough, called the caschrom (literally the crooked foot), was the most common implement on Skye. To a naturally curved oak or ash shaft, a long, flat coulter with an iron shoe was fastened with iron rings. At the junction of the head and the shaft a wooden peg was inserted for the foot. Although it was slow and laborious in use, the caschrom enabled the user to get better yields from his rigs than by ploughing. For many it was the only means of tilling the soil, unless a tacksman ploughed the small, rocky strip for his tenant. In terms of

two separate allotments must have been introduced by the
. Norway continues to use infield and outfield to the
nt day.

The infield, about one third of the arable land, was
d continuously with the aid of manure. The outfield was
d until exhausted and then left fallow while a new piece
rought into cultivation. Both were split into "rigs,"
ular strips about twenty feet wide and several hundred
long, separated by "balks," any uncultivated patch. Each
ad at least three rigs for his use. Annually, all ex-
ed at least one rig with the other holders by ballot.
all of the land was not of equal value, this periodic
tribution gave each man an opportunity to have the use
e best soil every three years. The use of the pasture
razing lands was regulated by a system of common rights.
tock of each individual was proportionate to his share
e arable land. When arbitration was needed to decide
ions of allotment, grazing rights, or rent, a "birley
," composed of the share-holders and their elected
able, was held. Economically, each farm appears to have 175*

from these influences. Now the government provided the capital, by grant, subsidy, and loan, and the guidance necessary for a fuller utilization of the land. The crofters who had already seen their subsistence economy disappear became a part of the national system of commerce. What effect have these influences had on the culture? 175* 178* 184 241

Throughout the modern epoch there has been a tendency to increase the production of exports, first cattle and then sheep, at the expense of the traditional subsistence crops. Within ecological limits, the national markets have determined what the Sgiathanach might produce. Since the environment has made Skye a pastoral land and agriculture is a poor risk in the best of years, abandonment of a subsistence economy has meant dependence on stock breeding for export. Commercialization of the land and increasing dependence on imported food has resulted in a growth of the importance of money. The decline in household industries, caused by economic deterioration, has also played its part in the people's dependence on currency. As a measurement of values, however, the importance of money has declined since the period of the large sheep farms. The crofter's margin of profit is small, and his opportunities to earn a wage are limited. Economic differentiation no longer affects the traditional status values, except within the traditional polarity of landed gentry and tenant. 175* 178* 439 175* 178* 439 436 [554]

In a comparable way, the utilization of more efficient methods of production is less important now than it was during the period of the "Clearances." Techniques have improved for the majority in so far as labor saving devices are available, but the achieving of modern efficiency is precluded by the 175* 178* 427 241

*175 crofting system. Both the communal nature of the system and
*178 the smallness of the crofts deter improvement. Although the
427 government reversed the trend toward making the land an im-
24 portant source of wealth and individualization of the land, by
[84] replacing customary forms of tenure with national laws of tenure, and has tried to correct the disadvantages under which the crofter labors, if not always successfully, the Skye crofter has made only a partial adjustment to the larger,
[31] specialized national culture. In fact, the land is used less systematically than it was in the past, in the times of the
[31] shielings. The crofters have not only ceased trying to reclaim arable but also have allowed much of the arable to go back to grass.

*175 Ever since the closing years of the first period of
*178 the modern era, Skyemen have sought employment as a part of
464 the national labor force. During the third and fourth periods, they joined the landless labor force in the Lowlands. There is practically no local opportunity for a landless man to support a family. The majority must remain pastoral agriculturalists who depend on seasonal employment, or some other form of financial assistance, to augment their income.

*175 Improved communications and the ensuing development
*178 of commerce has brought a village to the island. It functions
361 as a market center and as the administrative center for the island. It has not served to bring the island together; it is still something alien to their heritage. Accompanying the growth of the village, there was local development in the

122

There of turnips. All of the oats and a large share of the potatoes and turnips are sent to feed the cattle during the late winter and early spring. Some crofters, by no means all, have a small kitchen garden for cabbage, onions, and other vegetables. Usually, at least half the croft is left under grass, part of which is cut for hay. After all the people in the township have finished their harvest, on a day set by the grazing committee, the individual holdings in all but thirty of the townships are opened to communal use as winter grazings.[1] It might be added that the sheep and cattle often find the village of Portree a very lucrative pasture. It is not only the grass which entices the cows. More than one villager has had a tug-of-war with a cow bent on devouring clothes off the line. Another favorite food for the cattle is coal. As one man in the Braes said: "We burn half the coal the cows eat the rest."

The Value of the Croft

127 What does a croft mean to the Kintallanach? In terms of everyday economics, there can be no doubt that it means a few, probably no more than fifty families, the sale of cattle, sheep, and wool provides an income. The families are able to obtain the necessities of life and enjoy a comparatively high standard of living. Without the croft, they would not begin to support a relatively comfortable existence.

[1] F. Fraser Darling, C. S. Hayes, and Averil Worley, "The Agricultural Situation," Sgo Mhail Gaelic Survey, F. T. Leitig R.A., (Mimeographed, Sgoilt, Part 1, 1954), 10.

125

Morously determines the "economic," the number of stock which each tenant is entitled to carry on the commons.

127 The small croft has less than ten acres of arable and improved grass land. The average "economic" is ten cows and followers (heifer or bulloch calves) and usually ten to twenty sheep. Approximately 2000 of the crofts fall into this classification. The medium croft, representing about 250 landholding subjects, has between ten and twenty acres of land fit for crop cultivation and improved grass. The typical "economic" is ten to seven cows and followers, forty or fifty sheep, and occasionally, a horse. We might recall that the sheep may be either a club stock or a private flock. The large croft consists of almost 100 arable acres and is much more important in the predominately pastoral economy, an independent, self-contained grazing of 200 to well over 2000 acres. These diminutive crofters easily carry ten or more cows and followers and several hundred sheep.

127 For those who prefer to think in terms of area rather than stock, the relative magnitude of these self-contained holdings may be stressed by adding the fact that only thirty townships on Skye have more than 200 acres of common grazing. There are, for example, Linicro with 729 acres of grazing in 29 shares, Tuscaport with 500 acres in 12 shares, and Bornaskitaig with 273 acres in 47 shares. Over half the townships have less than 100 acres of grazing land.[2]

[2] Ibid., Table 1.

125

The Income of a Small Croft. The small croft is regarded by local agricultural experts as having a potential income of £50 a year. In addition, it provides a house, potatoes, some vegetables, milk, eggs, and the right to cut peat. Even if not quite legal until June, 1954, it frequently supplies mutton and, less often, beef for the family. The budget for this type of holding in sample reveals that even when fully stocked and the ground tilled, the income may be negligible. Let us look at the cash income and net profit for 1952 and 1953.

In 1952 the cash income for the croft was £8 11s. 11d. The net profit, which takes into account depreciation and stock valuation after sales was £4 1s. 11d. In 1953 the cash income was £12 8s. 9d., and the net profit was £7 5s.. These figures include money from the sale of stock, government subsidies and grants, and home grown produce eaten by the family. Unfortunately, I do not know the number of hours which were spent earning this meager return. The crofter's wife said about 300 hours of her labor. To this we must add seasonal cooperative labor.

This particular croft is rented by a middle-aged married couple and a spinster sister of the wife. The man works full time as town driver, leaving most of the work on the croft to his wife. The stock is two cows and followers and sixteen to eighteen sheep. There are six acres of arable land, half of it under hay and grass. The remainder is planted in oats, potatoes, and turnips. The budget may not be typical. For

126

those thing, an attempt is being made to build up the value of the sheep and cattle stock. Then too it is hard to obtain information on personal income. Not a few Highlanders are reluctant to share in the cost of maintaining the government and, consequently, equally reluctant to discuss their income. Still, it does give some indication of the potential income for 80 percent of the Skye crofters. It should not be forgotten that a large proportion of the small crofters will have absolutely no income from the land.

The Income of a Medium Croft. The medium croft, according to experts, has a potential income of £150 to £200 a year. Like the small croft, it provides a home, potatoes, vegetables, milk, eggs, meat, and peat. The budgets for one croft of this classification for 1952 and 1953 show a cash income of £201 17s 2d. and £170 15s. 11d., and a net profit of £169 12s. 1d. and £164 11d. The marked fall in net profit is accounted for by a decrease in the value of stock and, increased expenses, and the sale of fewer and younger stock, which also affected the cash income. The total hours devoted to crofting are estimated at 600 to 800 hours.

This croft supports a family, a married couple and their children, supplemented by seasonal ancillary employment on the part of the father. As presently stocked and stocked, it could not be left in a season with any expectation of the same return. The stocking is two cows and followers and fifty sheep. There are 16½ acres of cultivated land, all but a quarter under grass.

127

This budget is nearer the estimate of the local Department of Agriculture officers and may be repeated as typical. It also reveals that crofting is not a dependable livelihood. By budget for the large croft emaiffests the pitfalls in crofting by an even more striking contrast between the two years.

The Income of a Large Croft. The large croft is said to have a potential income of £600 or more each year. The holder will be a full-time pastoral-agriculturalist. In reality, as mentioned earlier, the large crofter is a small farmer and often has more land than some Skye Farmers. His income cannot be regarded as providing a home, even though his rent and taxes will be extremely low compared to the farmer's. For does it normally, if ever, provide peat for fuel. The peat is there, of course, but the crofter does not have time to dig it. Indeed, if he were to take the time or hire someone to do the digging for him, the cost of peat, in terms of man hours expended for it, would make it uneconomical, especially since it has only a quarter the calorie value of coal which he can and does buy for less. Like the smaller subjects, the large croft provides vegetables, meat, milk, and eggs for the table. The sample budgets which I obtained for a large croft show a cash income of £536 11s.5d. for 1952 and £602 7s.1d. for 1953. The difference is explained in part by increased sales of stock and in part by increased government subsidies. The net profit for the two years tells a far different story. In 1952 it was £229 6s.5d., but in

128

1953 it was only £13 2s.3d. This marked fall was due to the loss of sixty-nine sheep and one head of cattle, the effects of which would not be felt until the following year.

This croft is inhabited by a married couple, and the husband's father and younger brother. It requires the full attention of both brothers and, occasionally, hired labor, in particular in the spring when the sheep demand a great deal of attention. The income in 1953, its may be noted, was considerably more than most Scottish tradesmen and not far below that of a university lecturer. The stock average between five and ten cows with followers, ten head of beef cattle and from one hundred and 400 sheep. The cultivated acreage is fourteen acres, usually half of which is under hay and grass. I regard the large croft in my sample as typical, but it is typical of less than 1 percent of all Skye crofters.

The Income of a Farm. For comparative purposes, I should like to briefly consider the cash income of a Skye farmer subject. The budget I obtained in 1954 from typical, if not twenty-one farms each with its own peculiar advantages and each favored under differing technological conditions, I doubt that a representative type could be singled out. Nevertheless, the only way I could obtain a farmer's budget was to secure it surreptitiously; therefore, I do not know the details of stocking or the number who derive their support from the farm. We may be certain that it is one of the larger Skye farms. Despite an expense for hired labor of over £1000 each year,

129

the cash income was £1044 1s 3d for 1952 and £1527 1s 3d for 1953.[1] I do not know the net profit.

Summary. The foregoing facts and figures should make it abundantly clear that a man with less than ten acres of arable land and with a "economic" of less than three or four cows and fifty sheep can expect only a meager and definitely inadequate return for his investment of time and money. Several crofters occupy thirty or forty acres were required. This would mean a "economic" of 10 or 12 cows and 200 sheep, if the present proportion of grazing land to cultivated area were maintained. Some said 300 to 500 sheep would be closer to the mark in order to make a good living on the land. The budget for the large croft confirms this view, but even then we have seen crofting to contain a precarious element of risk. Most crofters fell short within their present acreage and "economic" which must be fored with a less hopeless proposition.[2] This, of course, would involve a further, coerced reduction in population. But this is all a matter for future planning. What we want to know is the contribution of crofting to the local and national economy.

The Contribution of Crofting to the Economy

If we are to determine the value of agricultural production from crofting, we must consider not only the cash and

[1] Agricultural Returns, June 4, 1953, Department of Agriculture for Scotland, Form 1 (Farmers enrolled in the files of the Department). These figures include adjacent small lairs.

[2] Ibid.

130

stock given for local household consumption and export but also the subsidies and crants provided by the national government. Unfortunately, it is not possible to estimate accurately the specific contribution of crofting to the economy of Skye. There is no available means of distinguishing the status of crofter from that of farmer in the annual returns of crops and stock or in the applications of farmers and crofters for subsidies and grants. Before getting down to pounds and shillings, we may find a brief digression to review the figures of land devoted to crop and stock raising and the yields to be expected helpful in our attempt to understand the many problems under which the Skyeman labors.

The total area of Skye is approximately 447,000 acres. Of these, 48,000 are cultivated and 399,000 are in hill, moor, and grazing.[1] The land under cultivation, excluding grasses, was only 3,254 acres. There were 6,258 acres of crops intended for use as hay and 13,924 acres of permanent grass or improved permanent grass. Of the latter, 3,500 acres, was uncultivated.

The stock, in 1953, was 1808 dairy cows and heifers, 8,108 cattle, 141,420 sheep, 41,888 ewes, 436 horses, and 139 pigs.[2] The dairy cows are mainly beef breeds which give a low yield of milk. The sheep are primarily the hardy Blackface variety but some crofters have cheviots, which produce a finer wool. For each sheep there are about three acres of grazing

[1] Agricultural Returns, June 4, 1953, Department of Agriculture for Scotland, Form 1 (Farmers enrolled in the files of the Department). These figures include adjacent small lairs.

[2] Ibid.

131

and for each head of cattle, acre forty-five acres.

The crops are not only limited in acreage but also in variety. Since there were less than ten acres of barley, which was not grown for silage, it may be said that the only crops in oats. The yield of the 2292 acres of oats was a low twenty-nine bushels per acre. The variety grown (Sandy) is not a threshing oat. It is fed to the cattle in the wheat. This, of course, means used oats must be purchased in the spring. The only other crops of any importance were 597 acres of potatoes and 99 acres of turnips. The yield for potatoes was about five tons per acre and for turnips, fourteen tons per acre. These yields do satisfy the needs of the Skyeman and his cattle. The hay was poor in both bulk and quality.

It will be seen from the preceding discussion that the livestock industry is the mainstay of the Skye economy. The production of crops is of no more than limited secondary importance. Let us now look at the value of the agricultural production on Skye in terms of locally consumed produce and exports. The following figures represent a collation of facts and figures generously provided by the Department of Agriculture for Scotland, the North of Scotland Agricultural College, and local officers of these bodies. For brevity, I have set them out in table 2.

132

TABLE 2

ESTIMATED VALUE OF AGRICULTURAL PRODUCTION ON THE ISLE OF SKYE

Produce	Total Marketable Production*	Local Consumption* (Household & Croft)	Exports
Oats	£ 32,500	£ 32,500	£ ....
Potatoes	23,500	23,500	....
Turnips	2,000	2,000	....
Hay	24,000	24,000	....
Sheep and Lambs	70,000	30,000	50,000
Wool	50,000	10,000	40,000

Milk	30,000	30,000	....
Poultry and Eggs	40,000	40,000	....
Pigs	6,000	....	6,000
Miscellaneous	5,000	5,000	....
Totals	£ 344,000	£ 216,000	£ 166,000

*Based upon assumed yields from crop acreages and stock reported to the Department of Agriculture for Scotland.

†Consumption includes an allowance for loss of stock.

The estimated income from the sale of stock and produce 436 amounts to some £6,000 a-year holding. One of my informants, an 237 agriculturalist of wide experience, thought that the estimate 241 was too high. He would put it at £4,000, or £55 per holding. In addition to the actual production, we must consider government subsidies and grants.

The most important subsidies are those on hill sheep 457 and hill cattle. Each of these average over £30,000 annually. 231 There are also calf rearing subsidies, marginal land grants, and several other available sources of aid which amount to £20,000 each year. Thus, the total income for the Skye crofters and farmers is increased by roughly £70,000. Production and subsidies together give an average income of about £100 per holding. We have already seen that the crofter's income may be either a fraction of this figure or several times the average income depending upon the size of his croft. To fully understand the significance of this fact and to explore further the evidence for cultural continuity, it is desirable to inquire into the seasonal routine of the crofters of Skye.

The Annual Economic Cycle

As crofts are delimited according to size and potential 221 income, the crofters may be classified as full-time, part-time, and spare-time pastoral agriculturists. Obviously, all crofters who work the land will follow a similar schedule, performing more or less the same variety and succession of tasks. There are, however, significant differences in the

amount of time which is allotted to each activity and in the 221 pressure on the crofters to complete each chore within a relatively definite period. There are also differences in the number of non-crofting activities in which the individual can or must engage. Let us follow several crofters through the year to see what these differences are.

The Full-time Crofter. One night say the year for the full- 221 time crofter begins during the first week of January when he 236 goes out to the hill to bring in his ram. This is the first break in the monotony of his winter schedule, but it is only a momentary break. Not until March does his season of prolonged labor begin with the first "dipping" of the sheep to rid the animals of tick and parasites. He and his wife, their children, if they are old enough, and their neighbors or hired hands, crofters from nearby townships, join forces. Several of the men go off to the hill to gather the sheep and herd them down to the "fank," a stone or sheet iron inclosure consisting of either two or three pens, a trough for the "dip," and a shearing platform. While waiting for the sheep, the remaining men and women prepare the "fank" for the day's work. One by one the sheep move through the pens until all have been picked up bodily and submerged in the medicinal bath. The women not only help their fathers and husbands at the "fank" but also prepare a noon meal for the group. 474 447

Following the dipping, the crofter turns his attention 221 to the soil. By late March or early April he has ploughed, 241

manured, harrowed, and limed his fields. Normally, he will 221 have a farmer to speed his work. In the meantime his wife 236 prepares her small kitchen garden. By the time he has sown 221 his oats and set his potatoes and turnips, the ewe sheep are 231 ready for lambing. Lambing begins during the last week or two 463 of April and runs through the middle of May. This is one activity which is exclusively men's work. It is also a chore which demands an early start from individuals who are normally late risers, seldom getting started before eight or nine in the morning. Now, all day long, from early morning until late at night, day after day, the crofter or his shepherd are found on the hill watching and waiting for the lambs and their natural enemies, the crow, the hawk, and the fox. During this time, he does not neglect feeding his cattle nor finishing putting in his crop if inclement weather has hindered his progress. Then, too, he may have a few ewes ready to calve. His 474 wife will then add milking to her regular household duties. 463 Men have only recently begun to

After lambing, the fa[illegible] 221 decide whether or not 231 they are going to take time out for cutting peat. As I have 349 already said, it is unlikely that the man of the house will want to bother. He has enough to do caring for the sheep and 221 lambs and preparing his cattle for the May markets. Although 232 he could attend the local sales which are held at convenient locations around the island, the large crofter has found the mainland market of Dingwall attracts buyers willing to pay higher prices.

If May is considered a busy month, June duties are even 221 more pressing. Although the winter gales are over, the rain- 236 fall has begun to increase. A succession and variety of de- 221 mands are made on the crofter's time. Once again the sheep 232 must be brought down to the "fank." This time the purpose is to mark the lambs. The ewes, unless one or two healthy specimens are selected for future use as rams, are castrated and smeared with a dye to indicate their ownership. The females are removed and have their ears cut to signify both ownership and age. Like the dipping, this operation requires 474 the cooperation of the crofter and his family, the neighbors, and hired hands. Next the sheep without lambs are dipped 232 once again and given a dose of medicine for liver flukes and a variety of diseases. At the same time, the early hay and, 241 perhaps, the early potatoes are ready for harvesting. The end 221 of June brings the Highland Wool Fair in Inverness. If he 223 has Cheviot sheep, as most crofters do, the man must go to arrange for their wintering on the milder and drier east coast. Even though Cheviots produce a finer wool than the more common Blackface sheep, they do not stand up to the incessant wind and rain of a Skye winter. If his wife can leave the children behind, she will accompany her husband. The old function of the Fair, the sale of wool, has disappeared under 530 government price control legislation.

It is not unusual to have the early harvest delayed 221 until July, but even then the mowing may have to wait because 236 sheep must come first. On one of the dry days during the first 231

or second week, the ewe sheep are sheared. Shearing is another cooperative task. The men and women work together with only one significant division in their labor. Women never shear. Their task is to run the sheep through the pens and fold the fleece after the ewe shear the animal. Another chore is added to the crofter's schedule at this time. He must begin to watch his sheep for maggot.

The haying season runs through July and August, depend- 221 ing on the weather. In August the sheep have to be dipped again 241 this dipping prescribed by law, and the wether lambs (castrated males) are sent to market. In September, if the weather is favorable and the season has been good, the harvest of oats begins. The man works with a scythe. Women rake out. His wife helps by binding the corn in sheaths by hand and making stoops in the field. Later she helps her husband build the stacks for winter storage. As in any summer month, the stock 221 requires attention. Cast ewe sheep (sheep over six years old) 231 and old rams are sent to the Ministry of Food grading station at Kyle, on the mainland, to be graded for meat or to Dingwall to be sold at auction. Cattle sales are also held on the island in September and again in November, but the full-time 232 crofter prefers the Dingwall auction. The rainy season is 132 now, as noted, reaching its height. The pace becomes slower. October, November, and, perhaps, even December are spent trying 221 to dig potatoes and turnips. Too often the cut harvest has 236 yet to be completed and the sheep must receive their second 221 shearing digging. Sometime before the end of November the 231 236

wool must be passed for shipment. As November ends the rains 221 are put out with the flock. 232 232

Winter is a slow season for men, but it is not an idle 221 season. The cattle must be fed. The man fetches oats of hay 232 from his stacks and some turnips or potatoes from his storage pits and carries the feed on his back to his cattle on the hill. Very rarely does he keep them in a byre because to do so he would lose the government subsidy on hill cattle. Although the sheep are now free from pests and most diseases, he must continue to periodically walk the hill to check their condition. Very few bother to feed the sheep in winter. Another task is 221 the butchering of a few sheep. While not quite legal until 232 last year, one crofter justified his activity by asking, "What would we eat if we didn't kill our sheep?" Once in a while, he may also kill a steer, but unless several families share the meat, salt beef becomes rather monotonous.

The crofter's wife keeps busy all winter. Her routine, 221 broken by helping at the fank a half dozen times a year and 232 with the harvest, continues through all seasons. As far as 221 the actual work on the croft goes, she milks the cows, feeds 232 the poultry, and cultivates her garden. When she is not cleaning the house, cooking meals, making butter or cheese, caring for the children, or looking after her husband's needs, she knits. She also does the shopping, either from a food van or on a weekly visit to Portree. Men are as disinclined to shop as they are to wash dishes.

The Part-time Crofter. The part-time crofter follows much the 221 same schedule and shares the same succession and variety of chores. Indeed, some are not so much part-time crofters as 464 they are part-time employees. As such, they are successfully 474 preserving a traditional economy no longer in respect with the surrounding twentieth century commercial world by depending upon economic benefits of contractual relationships to the smallest possible degree. One Fallow saw the situation this way: "We don't need fertizers and the like; what we need is something that will give us time to attend to our crofts." Others feel 227 that if they have to abandon the traditional way of life, they might just as well leave the island for places where greater opportunities for social activity are joined with relative economic prosperity.

The part-time crofter has less land than the full-time 221 crofter and less need for cultivating all of it because he 236 has fewer cattle to feed during the winter. He, therefore, devotes less time to tilling his soil. On the other hand, 221 although he has fewer sheep, the collective flock of his town- 474 ship is almost always larger than the stock of a large croft. Consequently, he spends more time dipping, marking, and shearing sheep in cooperation with his neighbors. Hired labor plays 221 a minor role in the townships. Often the only hired hand is 464 one of their number who assumes the responsibility of shepherding the flock. Some of the townships with club stocks, however, have adopted the practice of paying each shareholder for his labor out of the profits to encourage cooperation or to penalize those who do not do their full share.

those who do not do their full share. 464

The year for the part-time crofter begins with the prepa- 221 ration of his fields. As a general rule both the man who spends 464 his winter working for the British Railways or away at sea, and the one who finds summer employment near home is found on his croft during this period. Following the example of the large crofter some use a tractor while others continue to plough by horse. More and more are tending to take advantage of the contracting service of the Department of Agriculture and hire a tractor and driver. Once the crops are in, the majority are free until the lambing season. Conservative in his belief that too much handling of the sheep is harmful or individually 221 faced with the almost prohibitive task of singling a small 232 flock out of several hundred sheep, he tends to wait the March 221 dipping. During the lambing season, the several crofters of 474 the township either take turns on the hill or hire a shepherd. The first chore, then, which brings them together as a group is the marking of the lambs and the first dipping of the sheep, without lambs. The July shearing and the statutory dips in 221 August and November are cooperative ventures shared by all crofters no matter what size croft they occupy.

In sundry ways, economic interests, judged in terms of commercial efficiency, play a smaller part in determining the economic cycle of the part-time crofter than in the case of the full-time crofter. The part-time crofter does not think it worth-while to ship his few head of stock to the mainland auction markets. He sells them locally at the tri-annual sales.

As far as I know only one attempt has ever been made by the smaller holders to sell their cattle at the large mainland 464 sales. The attempt was made the first time I was in Skye in 1956. There was a feeling at the close of the Second World War among the crofters that they were not receiving a fair price at the local sales. The Scottish Wholesale and Cooperative Society, which had become interested in the Highland Problem, offered to handle the marketing. Their cattle buyer, a man of wide experience, for the Skye cattle to be of high quality and suggested shipping them to the Stirling market. This is one of the largest in Scotland has the advantage of attracting a full range of buyers. Since the cattle were not at their best after the long sea voyage, they were provided with hay and pasture for a week after arrival. Unfortunately, a disease epidemic in the South forced a postponement of the market. Nevertheless, the arrived at the auction block in good condition. The prices offered were not as high as they might have been but they normally received at the local sales, convinced the crofters that their August and November are cooperative ventures shared by all crofters no matter what size croft they occupy.

In sundry ways, economic interests, judged in terms of commercial efficiency, play a smaller part in determining the economic cycle of the part-time crofter than in the case of the full-time crofter. The part-time crofter does not think it worth-while to ship his few head of stock to the mainland auction markets. He sells them locally at the tri-annual sales.

While the men who devotes all of his time to his pastoral-agricultural occupation finds it uncomfortable to bother with gathering seaweed for manure, fishing, or cutting peat, the crofter of the category we are discussing often adheres more closely to the traditional cycle. After the

townships the large crofter is given an allocation in 427
tion to his rent. The payment of his rent also entitles 233
crofter to gather seaweed along the coast for fertilizer 222
cut peat for fuel on the common grazing or in special 314
areas. In a number of townships he has a further right 233
sture his rams in a "tup park" and his horses in a "horse
" These are lowlying areas of improved pasture. There
general picture.

There are three important exceptions to the typical 427
of land tenure. First, there are the Glendale crofters 423 421
wn their land. Each individual has purchased his croft,
he members of each township own the common grazing col-
vely. Before the law they are no longer entitled to the 654
its of crofting status because, by legal definition, the
er is a small farmer who rents his land. Second, there 233
he crofters of six Kilmuir townships who have individual
of "outrun," good lowlying cattle pastures, in addition
e normal crofter's holding. Even though the Glendale
ers are landowners and the Kilmuir crofters have their
attle pasture, they are subject to "souming" regulations.
, there are a few large, isolated crofts which are self-
ined units. The individual has his own cultivated land,
re, and rough grazing. In reality, many of these large
ngs are farms, but as long as the annual rent does not
1 £50, the benefits of crofting status are not withdrawn.
rofter, of course, stocks his holding as he thinks best.
the Irish and Scottish Highland systems of land use

While
the Irish and Scottish Highland systems of land use 171
427 reveal many underlying similarities, they are distinguished
423 by their respective systems of land tenure. The Irish small
421
171 farmer owns his land, like the Glendale crofters, and has a
self-contained holding, like the large crofter on Skye.[3]

427 Croft Size. As the foregoing discussion has suggested, there is a wide range of croft sizes. Some crofters have only a few hundred square yards of the poorest soil. A few have large, relatively fertile holdings. One of these large crofters, for example, has 88 acres of arable land, 27 acres of pasture, and 1261 acres of grazing. The most common size is less than five acres, and not more than 500 of the 2200 crofters have over ten acres. If all of his land were of equal potential agricultural value, the individual with ten acres might be able
[241] to attain a satisfactory standard of production. Unfortunately, not more than half of most crofts can be considered as suitable for crop cultivation. In Glendale, for example, the average size is ten to fifteen acres, but when the boggy ground and the area in drainage ditches are subtracted, it is indeed a fortunate man who can profitably cultivate more than five acres. What, then, does he do with his land?

427 Land Use. Between spring ploughing and the harvest season, the
241 best land is planted in oats, potatoes, and, in some cases, turnips. On most crofts, for every two or three acres of oats there are a half acre of potatoes, and perhaps, a quarter

---

[3]Arensberg, The Irish Countryman, pp. 36-38, 43.

427 of the holders reside on their land for more than half the
241 year. The lowest rate of absenteeism is found among the tenants
162 of the Department of Agriculture. There are 76 absentees out of a total of 667 tenants. Most of the non-resident crofters are permanently absent. On the small estate mentioned above thirty-seven of the forty-two absentees have not been seen in years. Five of them usually return to Skye to spend their summer vacation.

427 Thus, we have a situation in which, perhaps, a third
241 of the crofts are held by people who either cannot work them
311 because of old age or infirmity, or do not choose to work
887 them because of greater opportunities elsewhere. What, then, happens to this land? Some of the old people allow a neighbor to use the land. Almost invariably this means the few fertile acres will be used for grass and hay. Absentees "entrust" the [678] croft, house and land, to a landless family. While Parliament inadvertently gave the crofter a right to keep his holding whether he resided on it or not, it is illegal to sublet. So far, this has not concerned the crofters. Other absentees "entrust" the land to someone in the township who uses it for grass.

427 Turning to the influence of old age and absenteeism on
887 stocking, we find a series of entanglements. If the township is
231 inhabited solely by old people, like Aird in Sleat, the township becomes derelict. More commonly, the absentee and the old person allows someone else to take over his "souming" so [829] that some crofters have far more than their share. Not infrequently, this gives the crofter a chance to outwit that

a former school teacher. The present sponsor and chairman 573
is his successor. The teacher is automatically rated socially 875
because of his important function, educating the children of a 554
people who value education, and his university background. Further, he is from the Outer Isles and, therefore, is not expected to conform to all the traditional norms. Were he a Sgiathanach he probably would not accept the office for it would conflict with older and far deeper values.

The Glendale club farm is administered by a committee 573
of five, a secretary, and a chairman. Here all are crofters 241
from the several townships. All, therefore, are equals. Who, 554 794
then, might they have for a chairman? They have selected an elder of the church. A church elder is the highest lay official in church government and, on Skye, one of the oldest men in the neighborhood. As one man asked, "If you can't respect an elder, who can you respect?"

Selecting members for the committee and electing a secretary 573
is a real problem. Each man serves for three years. How the 241
original committee was formed I do not know, but I had an 554
opportunity to see how vacancies are filled. In 1953 there were three vacant posts. Parliamentary procedure has been introduced, but it finds limited expression. For two of the seats, the retiring members were "re-elected;" a crofter nominated them and after a long pause another man seconded the nomination. No vote is taken; silence means unanimous consent. A story slightly off the point illustrates this. At the same meeting the committee's stock report was read. Following parliamentary procedure, it

had to be accepted. Not a word was hear
crofter simply said, "No one has anythin
all are agreed." One of the former memb
could not be re-elected; he had passed a
matter. A series of men were proposed,
clined. Finally, a man was nominated an

Skyeman. The attitude of the former faction was aptly expressed 241 656
by one person who was about to leave Skye: "We need the Department. 829
If they withdrew, we wouldn't have anybody to go to for anything." This is in striking contrast to the Irish small farmer for whom land ownership is an all important factor in regulating social interaction and status.[24] On Skye land ownership has not led to 423
any change in the traditional status values. A Glendale crofter 554
is not a better man because he owns land.

Prestige Ranking within the Neighborhood. In so far as prestige 554
ranking is concerned, status is more developed within the neighborhood than within the township. In addition to the crofters and their families, there are always several individuals who are given status because of their performance of the necessary functions of ministering to the peoples' spiritual and physical needs and educating the children. These are the only achieved statuses which are valued by the crofters. Noteworthy enough, 793
only the minister of Glendale serves his own "people and friends." 554

The minister's status depends to some degree on his denomination and the religious sympathies of the people. In Glendale the minister enjoys the highest possible status. In Kilmuir, with two ministers, each is valued by his own congregation with whom he interacts. Nevertheless, all ministers are treated with respect. They are always addressed as the Reverend Mister MacDonald or Mister MacDonald. It is interesting to note that

[24] Arensberg, op. cit., pp. 72-100; Arensberg and Kimball, op. cit., pp. 98-144.

asceticism is fundamental to the peoples' lives. A brief discussion of the Sabbath will serve to conclude my discussi of religion and to indicate some additional difficulties whi the Sgiathanach faces in his attempt to preserve his culture

Sunday does not exist on Skye. There is the "Continen Sunday" and the Sabbath. On any other day of the week, the greeting is, "It's a fine day," or, more often, "It's a wet day." The Sabbath, however, is "no day to be speaking of days." Keeping the Sabbath is almost a fetish among the people. It is a readily observable test of an individual's religious capacity. All unnecessary work, all unnecessary words, and all unnecessary thought is taboo. Only the barest minimum of worldly activities are permissible. This does not mean a day spent in idleness; the time should be spent in public worship at the kirk, private spiritual contemplation and family worship. The Skyeman's estimation of a newcomer may depend on his keeping the Sabbath. One man was very surprised to learn how long a memory the people hav when a man deviates from the expected. A visitor asked a crofter what kind of a man a certain newcomer to Kilmuir was, to which the crofter replied, "He's all right, except six years ago he played the pipes on the Sabbath." Most newcomers, including the few Catholics, respect the Sabbath.

No crofter would ever think of doing any work on this day beyond feeding his cattle as an act of mercy. After weeks of rain, the crop of oats or hay may be ready for harvesting on the Sabbath, but he will not touch it. A man

sion of labor. During the summer, she will milk the cows, 231
in the winter she will see that they are fed. If there is 241 593
a harvest in the autumn, she will care for the crops. 462

Some women, in particular the older ones, plough with 241
caschrom, the foot plough. Other women use a small power 654
en plough or contract with the Department of Agriculture 462
ave the ploughing done. The Department will also provide
men and machinery to harrow, cultivate, spread lime and
re, mow hay, cut and bind oats, dig potatoes, and thresh
n. By utilizing these services, if they can be afforded,
small crofter can free himself or, at least his wife,
many arduous tasks. The need for cooperation of the family [476]
neighbors is thereby reduced. Although traditional mutual [593]
is being replaced by cash payment for labor, it is not the [178]
r of a landless working class which commercialization often
tes, but rather state provided services. Significantly,
Department employees are newcomers. The Skye man who
s for the Department is a better worker away from the island.
e few are able to pay for these services, the wife digs the 241
toes, and some women use the scythe to reap hay and oats. 462
scythe, it will be remembered is really a man's tool.
uently, the break with tradition is avoided by the return of
n from the mainland or the sea. Running the household and
ing the croft is not all some women do. They also take in [485]
er visitors, by the day or week, and provide teas for travellers.

In summary, it may be said that crofting is anything but 241
asy life with ample rewards. We have seen how meager the

fruits of labor are for the vast majority. Although they 241
establish their own tempo, the crofters, both men and women, must follow the dictates of the seasons. Inclement weather imposes prolonged periods of idleness. There are conflicts. These are not conflicts of meaning, but they pose serious problems. The small crofter has to decide how he can best allocate his time. He may want to get in his hay or try making silage, but his sheep, his main source of income, must come first. This does not mean that there is economic disintegration. Integration does not mean smooth functioning. Perhaps, a further discussion of cooperation will clarify the situation.

Cooperation

Today it is commonplace to assert that the Sgiathanach, 476
and the Highlander in general, is "independent" and "just not 241
cooperative." Certainly they have come a long way from the 178
days when the old four horse plough made cooperation essential 829
and the use of the caschrom made it welcome. Population instability, subdivision of the crofts and the change from a subsistence economy to an export economy based on sheep and cattle could not have left the old pattern of mutual, reciprocal dependence undisturbed. But does this mean they no longer cooperate? I think not. In fact, I think critics of the Highland Problem have exaggerated,[9] and the people, always ready to glorify the past, have been influenced by stories of an ideal

[9] Cf. F. Fraser Darling and Averil Morley, "The Social Situation," The West Highland Survey, Part VI, p. 2.

world.

More than one crofter told me that one of the biggest changes on Skye in the last thirty or forty years was that t neighbors are "less Christian," in the sense of being neighb and helping each other, than they used to be. Once no one said, "I've finished my work," until everyone in the townshi had stacked his grain. "Colin is harvesting today and Murdo morrow; we'll go over and lend them a hand," was the expecte attitude. Toward the end of the season, the whole township would be seen working on an old widow's croft. "Now when a man has cleared his land, he says, 'I'm finished,' and that' that." such a statement has to be followed by asking if they now forget about the sick and the aged. The answer is alway the same: "When a person needs help, his neighbors will hel out. Perhaps they can't do his corn, but they help by just leaving a few fish by the door or a pail of milk in his cott In short, they continue to give mutual aid, but it is anonym The Highlander never looks for thanks and never offers it. remember our landlady complaining about an Eastcoaster in Portree whom she had helped by giving some outgrown children clothes. The recipient had thanked her profusely. "You kno Paul," she said, "If anyone did that for me, I'd be too chok up to say anything."

Not all use the same colors to paint the scene. I was also told that the harvest was formerly a time of friendly rivalry. The gobhair-bhacaig, two sheaths of oats tied at right angles, used to be thrown on the unfinished fields wit

each township as a sign of contempt.[10] This suggests that the practice of helping one's neighbors with the harvest was relatively recent. Again in the matter of cutting peats, frequently described as cooperative, and a communal undertaking as late as 20 years ago, there is disagreement. All in the township used to work together, cutting for each crofter in turn and enjoying a festive picnic. "Sure they would," others told me," but first they would cut for the minister and then for the shopkeeper." The shopkeeper was more important to them in those days because they would all be in perennial debt to him, and he might extend a little more credit if they were in his good graces. They would then cut for each other. By the time they got around to the old widow with no one to cut for her, they were all too busy. The sheep had to be dipped or the fields needed attention. I have heard conflicting versions of these stories from neighbors. Are we to conclude that cooperation varied from door to door and township to township?

The growth in importance of sheep as a major source of income, associated with the decline of the old subsistence economy, led to new patterns of cooperation. To be economic sheep must be raised in numbers. As we have seen, physical cooperation is imperative, and many crofters cooperate financially, pooling their capital and dividing the profits. This is true of the nine townships of Kilmuir. Moreover, even in townships where the crofters have rejected the club stock plan the individual flocks are generally handled as club stock.

[10]Cf. William MacKenzie, Skye: Iochdar-Trotternish, p.59.

The maximum is harder to determine, economically. There is some limit to the number who can stock a common grazing with individually owned stock without becoming involved in complicated entanglements over right, obligations, and questions of ownership. The few townships containing more than thirty crofts in the Western Highlands (91 out of 957),[13] and the negligible number on Skye (only ten), suggests that less than thirty holdings per township, no matter how much fertile land surrounds the cluster, has been found to be the optimum. Most of the townships contain between five and twenty crofts. The fact that many large, adjacent townships, such as Bornesketaig in Kilmuir and all those in the Braes, are losing their population is a reflection of a many faceted condition we have been exploring throughout this chapter--the vast majority of the crofts are too small to provide an adequate livelihood. One of the primary causes for this state of affairs would seem to be overcrowding on the land.

Congestion. In almost all but the recently established or replanned townships, congestion is a legacy of the increase in population during the first century of the modern period, often aggravated by coerced subdivision during the period of the "Clearances." Because of this, over-all statistics have little meaning. It is quite correct to say there are some 2300 crofts on Skye and approximately 2200 crofters, but this does not mean each family has a croft to itself. To take

[13]Ibid., table 1.

extreme examples, Borneskeitaig in Kilmuir consists of 47 crofts held by 35 crofters, but Aird in Sleat has 39 crofters who rent 20 crofts. In one badly subdivided township, Calligary in Sleat, one holding is held in the following shares: four men each have five-twenty-fourths, one has one-sixth, and one has "a part." The whole, indeed, is more than the sum of its parts. Moreover, townships with a balance of crofts and crofters, and even those with fewer crofters than crofts, often show the effects of subdivision. Another Kilmuir township, Herbusta, is laid out in eight holdings. Although there are an equal number of landholders, several of the crofts are divided into half shares. Then, there is Kilvaxter, also a Kilmuir township, with 11 tenants and 12 crofts; one man has three full shares while two others have only half a croft each. Multiple crofts are not necessarily adjacent. Some crofters hold land in two different townships. One of my informants rents two crofts separated by over twenty miles. On foot, it takes him two days to make the trip between his two holdings.

Subdivision, frequently carried to its ludicrous extreme, is not a problem confined to the Highlands of Scotland. All over Europe the traditional laws of succession have had a similar result. In consequence, the governments of all European countries have been striving to initiate reform. Generally, the aim has been to consolidate scattered patches, but almost always the schemes have become more comprehensive, attempting to create economic farms and increase productivity. Since the

means are not infrequently thwarted by the peasants, the ends are seldom achieved.

As long ago as 1859 Norway began a redistribution of the land; by 1946 42 percent of the infield and 9 percent of the outfield had been regrouped. In Ireland attempts at consolidation date back to 1870. Because the problem was especially intricate, some holdings consisted of twenty or thirty scattered patches, the attempted approach has been comprehensive, including assistance for migration, improvements, and the purchase of farms. Today, even where the consolidated holdings are substandard, they are more productive. I do not mean to imply that the program has been uniformly and sweepingly effective. The study by Arensberg and Kimball is ample evidence to the contrary,[14] but there has been reform. Germany, too, has had an all-inclusive policy since the 1870's. There, whole villages must be replanned. Wherever possible, small holdings have been abolished by moving certain families out to new farmsteads and removing others from the land. It is significant that most of the reform took place under Hitler and, even so, there was universal peasant resistance to land reformation. What effect the partition of Germany has had on these rural villages I do not know. Many of those I visited have twice the population of prewar days. In each country, from Sweden to Italy and from France to Greece, the experiments have resulted in increased agricultural production. On Skye, as in most of the Highlands, the tillage area has fallen at a faster rate than the population. Indeed,

[14] Arensberg and Kimball, Family and Community in Ireland.

where the population has suffered the greatest decline and, therefore, where enlargements, by legal or illegal means, have been the most extensive, crop production has declined the most. Nor has the decline in population, accompanied by land redistribution, altered the fundamental problem.

The cottars (subtenants) have almost disappeared thereby easing the excessive pressure on the land and removing the threat of recurring destitution. Today they are found only in a few scattered dwellings and isolated clusters. Most of them have secured some form of employment or have reached the age when a government pension is sufficient to satisfy their needs. The number of crofters, on the other hand, has increased. If the figures 2043 and 1227 can be accepted as nearly correct for the respective numbers of crofters and cottars in 1886,[15] they have increased at the expense of the latter and, also, the sheep farmer, whom they have replaced.

To briefly summarize the foregoing discussion of the township, let us look at Kilmuir. Table 3 shows the number of crofts and crofters in each of the nine townships together with the acreage and "souming" rights available to each individual. Although replanning during the past fifty years has benefited many of the local residents, crowding upon the land is still apparent.

[15] L. MacDonald, The Past and Present Position of the Skye Crofters, sheets 6, 17.

TABLE 3

CROFTS, CROFTERS, ARABLE ACREAGE, AND SOUMING RIGHTS IN THE KILMUIR TOWNSHIPS

Township	Crofts	Crofters	Arable Acres[a]	Common Grazing	Souming
Borneskeitaig	47	35	4	273	2 cows, 1 calf, 12 sheep
Hungladder	14	9	5	236	2 cows, 1 calf, 10 sheep
Balgown	4	5	13, 14, 34, 46, 66	177	4 cows, 4 calves 26 sheep
Kilvaxter	12	11	27	...b	4 cows, 4 calves 26 sheep
Linicro	19	17	15	729	5 cows, 5 calves 40 sheep 1 horse
Peingown	3	4	18	187	7 cows, 7 calves 20 sheep 1 horse
Herbusta	8	8	12	308	3 cows, 3 calves 26 sheep 1 horse
Totescore	12	13	21	500	3 cows, 3 calves 20 sheep 1 horse
Monkstedt	3	3	27, 27, 5	420	9 cows, 9 calves 40 sheep 2 horses

[a] Arable acres are given in average acres per holding, unless otherwise indicated. Except in Borneskeitaig and Hungladder, arable land includes outrun, improved pasture land individually held.

[b] Shared with Kilvaxter.

worth while to cultivate any of the arable, so I use it for grazing." A case which aptly illustrates the influence of the township system as an agent of conservatism is the breeding of pigs. Although several old crofters told me how many people during the times of the "Clearances" kept a pig, they are rarely found anywhere in the Highlands today. The Biblical injunction against the flesh of swine has been taken literally. The older people simply have a strong aversion to handling pigs. One man, a very successful cattle and sheep breeder, put it this way: "Pigs are filthy brutes. I just don't want to touch them -- I never have kept any and never will." At the same time, there are men who believe that the prices these animals bring at the mainland markets more than compensate for the individual's revulsion, especially as long as the Ministry of Food pays for the cost of transportation. These men cannot try branching out because they have no way to restrict the foraging animals. "Skye is ideal for pigs," one young fellow told me, "but I don't have the freedom to work the croft to suit myself."

Smaller deviations from the traditional methods of land use face the same difficulties. A progressive crofter who attempts to improve the value of his stock by growing scientific mixtures of grasses is always penalized. As soon as the harvest is over, the stock of all his neighbors will show their appreciation by concentrating on his croft, trampling his fields, and overgrazing his grass. Nor is this his only penalty. His neighbors will regard him with skepticism for his departure from the ways handed down from the past.

621 from the ways handed down from the past. We might note at this
432 time that even the progressive crofter is not always quite en
626 rapport with modern techniques. There was, for example, a man
232 with two calves infested with liver fluke. Convinced that
178 medicine was the only solution, and equally convinced that a person cannot believe everything he reads, he obtained a bottle of liver fluke medicine which was plainly marked: "for sheep only." When asked how his calves responded to the treatment, he responded, "Och, they both died."

632 Because of the restrictions which the township system
621 imposes, there has been a growing, perceptible rumble of
626 agitation for supplanting unanimous consent with majority rule.
178 Few, however, would go as far as a retired seaman who returned to Skye after forty years. He would like to see the township system abolished. Another small group believe the Sgiathanach would be better off if the Island were given over to communal farms. Most seem to favor the continuation of the present system. Of course, the majority is composed of the conservative old men.

The Aged and the Absentee Crofter

241 No appraisal of the crofting system is complete without
427 a discussion of two additional factors which have affected the
887 use of the land and the present unsatisfactory economic condition
888 of the Island. One of the factors is the aged tenant, who,
311 as we have just seen, exercises a strong control over the younger men through township government. He has also influenced

241 the economy by subjecting many fertile acres to disuse because
427 of his infirmity. The other factor is the absentee tenant,
887 an individual who has obtained possession of a croft, normally
888 by inheritance, but who has failed to take up his inalienable
311 rights of tenancy. Let us very briefly review the economic trends of the last fifty odd years and, then, try to assess the importance of the absent and the aged.

436 Although the Sgiathanach has refused to become a
433 specialist, fully involved in a money economy, he has become
241 increasingly dependent on the products of the wider commercial
178 society.
439 Long ago he gave up growing the old staples, barley and oats. Not for many years has he grown enough potatoes or turnips to feed himself and his cattle. In place of these home grown subsistence crops, he now imports a great deal of his food. In an average year Skye imports over 700 tons of bread, 10 tons of vegetables, 300 tons of canned goods, 300 tons of potatoes, 500 tons of flour, and 100 tons of milk. To pay for these products, he exports cattle, once his only marketable produce, and an ever increasing number of sheep.

436 Hance, writing about the Outer Hebrides, sees the growing
241 tendency of the crofters to buy their food as indicative of an
233 increasing cash income.[16] To a certain extent, this may be
439 true. There are, however, additional factors involved. Ecological limitations have played their role. That the climate and soil together make Skye a grassland suitable for stock breeding rather than an island fit for cultivation is an often repeated

[16] Hance, The Outer Hebrides in Relation to Highland Depopulation, p. 62.

436 belief. Since agriculture is a poor risk in the best of years,
241 the present tendency to use more and more of the land for grass
233 and hay can be regarded as a more complete adjustment to the
439 environment. The partial involvement in the outside contractual world encouraged and made possible the change. The same reasoning applies to stock production, including the declining number of horses, cattle, and, especially, dairy cows. The exports, obviously, reflect market demands. A couple of crofters have unsuccessfully tried market gardening. The Sgiathanach is not a vegetable eater, and the commercial establishments, apparently, find a more dependable supply
436 elsewhere. A few crofters do sell potatoes in Portree, but
241 they will not compete with the large, east coast potato
432 farmer. In 1953, as soon as the price fell below the pre-season high, the crofters decided it was not worth the trouble
437 to dig the tubers for sale. The same held true for eggs.
436 Many crofters barter eggs with the food vans which serve the
235 rural areas for tea and meat. When the Scottish market was glutted in the summer of 1953, the crofters refused to trade at lower prices. They preferred to obtain their protein from the eggs, believing that the spring egg prices were the fair prices. For the sake of emphasis, I repeat, the involvement of the Sgiathanach in the world of commerce is only partial. Finally, in accounting for these changing economic trends, the aged and the absentee crofter must be taken into account.

887 The old people frequently cannot work their crofts or
241 cannot use them fully. The age at which the work becomes too

887 arduous is difficult to determine. In the winter of 1953, I
241 helped a small crofter thrash oats, a cooperative enterprise
128 even with a mechanical thrasher, supplied by the Department of Agriculture. The neighbors who came over to lend a hand were two men and three women. The youngest woman would never see fifty again; her seniors were seventy-seven and seventy-eight. The youngest man, who had just been married, was sixty-three; the other seventy-three. These crofters not only showed more endurance than I did, but put me to shame by carrying the sacks of grain from the field to the byre
162 at the end of the day. Nevertheless, most of those over seventy, about 15 percent of the population, do not make use
887 of the land for more than growing a few potatoes. An old
231 man cannot keep a cow because, as one man said, "You can't
462 have a cow unless you have a woman to milk it." If he is married or lives with a sister, there may be a cow and a couple of sheep. An old woman may have her cow and sheep if she is strong enough. There comes a time, however, when all the old people will only remember the work involved. Still they will say, "Och, but they were good for all that."

427 Absentee tenants are responsible for depopulation on
241 the one hand and falling production on the other. A reasonabl
161 estimate would be 300. Their number could be as high as 400.
423 Some townships have over 50 percent of the crofters absentee. The only townships which do not have this problem are the few which contain large crofts. On one small estate there are seventy-six crofts, held by seventy-two crofters. Only thirty

ng season, the crofter and his family go out on the moor 221
t their peat for the following winter. The man uses a 241
er," a two-bladed spade, to cut the peat. His wife or 314
hildren follow behind, tossing the peats out of the ditch 413
uilding small, loose stacks for drying. After the lambs
been marked and the sheep dipped in June and the shearing
ned in July, the family returns to the banks to carry
eats to the nearest road, actually a beaten cart path,
eels. They are then carted home and stacked near the door.
is a growing tendency for both the part-time and spare- 341
crofter to give up cutting peat. It is not because coal 178
eaper or he needs time for other pressing chores. His 241
ary occupation will not permit his devoting the necessary 464
o this long and arduous task. He is caught between the
ional economic patterns and the money economy of which
become a part.

The year for our part-time crofter, as for all active 221
rs ends in November. By then the oat and hay harvest has 241
tacked by the house and the potatoes and turnips stored 236
ground, the wool shipped off to market, the surplus 233
and cattle have gone to market, and the rams are on the
Now follows a period of enforced idleness, broken by
g the cattle. As we have seen many go away to find 464
ment, leaving the care of the croft to their wives who 593
hared the work of crofting in addition to their own
y responsibilities. We must turn to the spare-time 462
r to discover just how heavy the burden of labor may
nd upon the women of Skye.

depend upon the women of Skye. 000

The Spare-time Crofter. Under this type we must include not only the able-bodied, married man who tends to become a full-time wage earner, but also the old, pensioned, married and unmarried men and women who are no longer able to perform the necessary chores. For the latter, whether they have a small or medium-sized croft, the croft becomes a means of living within a pension rather than a potential source of livelihood. For the former, the croft becomes a means of living cheaply. 231 241 887

When the crofter goes out to work, he either tends to neglect the croft or expects his wife to manage it. Occasionally, the husband will help with the ploughing or the harvest in the evening, but he never lends his wife a helping hand in her domestic duties. The only men on the island that I knew who helped their wives with the dishes or the care of the children, except disciplinary measures, were a minister from the Outer Isles and several Lowlanders in Portree. Since very few crofters have plumbing, the wife must fetch water from a well and dispose of waste in the nearest stream. If there is to be a supply of peats, she must cut them. If there are cattle and sheep, she looks after them. Lambing may be left to the township shepherd if the crofters can afford one, and shearing is usually left to the men of the township. An exceptional spinster or widow may shear, but it is indeed an unusual married woman who will break with the traditional 231 241 593 462 [312]

f tenure function to protect the individual from potential 178
buses by a landlord where customary usages once fulfilled the 182
eed. Moreover, even though the tenure of the cultivated soil 423 427
rants all the rights of a landholder, including the rights 657
o bequeath the house and land to a member of one's family,
or more than half the year it is used communally.

The Sgiathanach has never adjusted sufficiently to become 178
specialist, not even a specialized grazier. For him the 423
and has always had a more fundamental value than merely being
means of livelihood. It is the ancestral home. There is a
entimental attachment to the land which is an expression of
he affectionate bonds of kinship. The people have never lost
he tribal tie of the land and the group. Although the former
atriarchs disclaimed any sympathy with this point of view,
he landlords on Skye today have kept what little land they
ave only because of its sentimental value. Indeed the atti- [656]
ude of the largest landholder, the government of Scotland,
s that the crofting tradition is worth while preserving, if
or no other reason, because in the predominantly urban and
ndustrial civilization it has a romantic value. There are
ther reasons. The Islands have long been looked upon as a [702]
uman reservoir for the armed forces, and, more recently, for [464]
owland industry.

As a result of their partial adjustment to the higher 178
ocio-cultural level, there have been changes in crops and stock. 231 241
he British market has influenced the crofters' output, within 433
cological limitations. The old subsistence crops of oats and

ey have been replaced by grass and hay. Conceivably, this 178
more complete adjustment to the environment, which has been 231
possible by integration with a commercial economy, than 241 433
djustment to the demands of the outside world. Whereas
objective of the local economy once was the export of
le, today the purpose is the breeding of cattle and sheep
the national markets. We have seen that there are a host 182
imitations and difficulties in the economic aspect of the 231
ure. Many of these are due to the persistence of con- 241 433
ative practices. Each crofter must keep pace with his [624]
tion-practicing neighbors, with the old men of the town-
. Others are the result of an inhospitable environment.
economy does not run smoothly, but this is not conclusive
ence for disorganization. Integration does not mean
th functioning. In the spring and autumn the crofter is
ronted with a variety and succession of tasks which would
a specialist with dismay. Very often, these pastoral
gricultural chores have to be carried on in conjunction
outside employment. In return for his labor, the crofter [134]
ves a meager income, frequently supplemented by con- [657]
u tions from his children or the government. As a further [167]
t of the partial adjustment to the wider society and
ure, the people leave the island to seek employment and
hieve an upward mobility impossible on Skye. Economically, [175]
along with most of the Highlands, may be viewed as
enting a picture of the Lowlands of Scotland 200 years ago.
is the extent of the economic adaptation of the Sgiathanach
e national culture.

242

242 AGRICULTURAL SCIENCE--practical and scientific knowledge of plant breeding, soils, and parasites; related practices (e.g., seed selection, hybridization, crop rotation, spraying); agricultural experiment and extension work; organization and specialized personnel; etc. See also:

178 "The cattle give too much trouble." A smaller scheme
311 is grazed only by sheep. On the schemes where mixed
232 grazing is practiced, a number of conflicts arise between
233 those who have only sheep, and those who have cattle as
578 well. To accommodate different demands, one township scheme was divided with a fence; cattle were put in for a month in one part, and then shifted to the second part. The sheep were then brought into the first half. All stock had to be removed from the scheme a month before the lambs were weaned, so that all worm eggs and other harmful elements in the dung of animals previously present would have time to die. What was once used for a single purpose by everyone now has to be divided.

"I paid one pound a head to put cattle on the
435 reseeding," says a man named Iain. "Now I have to move
578 them off already. Those sheep people want it for themselves. I won't use it if they're going to be like that. Next year I'll have the use of two crofts and my apportionment. And now that I have my own tractor I
409 can put a load of sand at the bottom of the croft to
242 make the grazing better."

According to another person, who also keeps cattle
311 on the reseeding, "Some people want to move their live-
233 stock on and off the schemes when it suits them, like Iain,
232
829

654 person has. The gigantic bureaucracy of government
829 agencies is mysterious and unpredictable. One can
241 never be certain when or for what reason another economic increment may come. "I used to throw away a form from the Department of Agriculture until I found out from somebody that you could get money with it. You say you're planting so much of your land in oats, and later you fill out another form saying you didn't get a very good return, and they send you a deficiency payment."

For some crofters, the requirements of the subsidies
241 have affected the extent and techniques of agricultural
242 activity. For example, one man used to work his land
654 in the way that his ancestors learned would bring best
178 results: lazybeds were aligned in strips that would drain well and catch the sun, and stones were left in the soil to capture the sun's warmth and thereby facilitate the growth of potatoes. Now he has merged the separate strips, cleared the stones, and divided the land into units that allow him easily to calculate how much he has used for what crops, because to be eligible for a particular grant, a certain percentage of arable land must be ploughed with grass seed and rotated with other crops.

The Department of Agriculture and the Crofters
241 Commission often overlap in their subsidy-giving functions.
654

5 AGRICULTURE AND FISHING

THE economic possibilities of the peat blanket of the island, 175*
particularly in Lewis, have attracted the attention of many 134
would-be exploiters. Sir James Matheson's advisers formed 311
the idea that the Lewis hags could be turned to a good profit, and Sir James's series of peat reclamation and improvement programmes are still echoed today. He first cast his eye to the west, north of Achmore, a township set up more than a century ago on deep peat. The peat reclaimer he employed was none other than Alexander Smith, one of the best-known 'speculative' agriculturalists in Scotland at the time. Smith had already transformed the Carse of Gowrie from bog to a fertile tract of land; could he not do the same in Lewis? The site chosen was seven miles from Stornoway and the little hamlet established there was called Little Deanston, in recognition of Deanston, Perthshire, to which Smith belonged. The soil consisted of bog-moss, varying in depth from 3 to 8 ft. Sixty acres were wedge-drained and laid [242] •
out in fields of ten acres enclosed with ditches and turf fences. Ploughing and trenching began and fertilizing agents were applied, including clay marl, shell sand, guano and dissolved bones. Two of the fields were put through a course of arable cultivation, the others being laid down in grass. After the fields had been worked for a few years it was found that the driest ground gave the best results. In time the land was handed over [241]
to some crofters from nearby Lochganvich, but in 1850 it was abandoned because of the difficulty in getting seaweed for manuring; and besides it was not possible to keep the land in good heart and to do fishing as well. The tract of land concerned today still shows a better quality of pasture than the adjacent natural moorland.

Smith gave his impressions voice in 1844, just after his first 175*
visit to Lewis, to the august members of the Glasgow Philosophical 241
Society. The cultivation of the soil was as primitive as the 134
311
181

*175 islanders' manufacture of cloth. The inhabitants were at least a
241 century behind the times, though they were, he found, in no way
134 deficient by nature. They were social in their own style, and they
311 had very good heads, 'that is, for people not accustomed to habits
[181] of thought'. So far as agriculture was concerned, nothing in the way of draining the land had ever been accomplished; nor had any effort been made to penetrate the hard sub-soil. He held that
[137] the great scarcity of timber had been a serious handicap when
[412] it came to agricultural implements—to their renewal, repair or possible improvement. Under direction, however, he was convinced that improvements in land use would result in considerable benefits to the island. He added that he hoped the period of this improvement would not be far off and that visitors would find 'a green, pastoral land instead of a dreary waste'.

*175 Yet not until 1928 was peat reclamation and development
• 242 again brought out for an airing. This time, the benefactor was
134 the late Mr T. B. MacAulay, a Montreal magnate, a son of Lewis
311 connections. He gave £10,000 to establish an experimental farm in Lewis, and a site on Arnish moor, not far from Stornoway, was chosen. It was typical of most of Lewis: black, water-holding peat, which when squeezed, instead of allowing water to escape from it like a sponge, oozes itself through the fingers. The aims of the farm were to provide additional arable land on which to grow winter fodder, and to improve, at as low a cost as possible, the grazing on the moorland. Fifty acres were certainly converted from moorland to arable, and this formed a basis for an experimental extension to another 100 acres. By 1936 the farm had a sales income from produce of about £1,400. The stock in that
[231] year included 40 head of thriving cattle, including 15 dairy cows, 20 poultry, 140 blackfaced sheep, and some fattening pigs. The sheep were a late addition, made with the dual aim of pasturing on moorland too deep and soft for cattle in wet weather, and of improving the sheep strain of the island.

By 1938, it had been shown that some lasting improvement on moorland of reasonably favourable slope could be effected at a materials cost of about £3 per acre, and without heavy labour costs. Thus, the common grazings held by the crofting townships could be improved, if a co-operative effort were organized. So

far as the reclamation of arable land from moorland was con- 175*
cerned, however, requiring as it did under-draining and cultiva- 242 •
tion, the labour costs were heavy, approaching the £20 per acre 134
mark including the liming and fertilizing. 311
234

Though the farm was used for dairying with some reason-
able results, the moorland acres put into good heart at Arnish were left to deteriorate. The run-down of the experiment followed the depression of 1933. Funds dried up, and in 1939 the farm was let to a tenant. But the lesson obtained from the MacAulay farm was a good one. By simply dressing with shell sand, of which large quantities are available on the shore-lands, applying some form of phosphate and seeding with cheap clover or ryegrass—involving no cultivation—large areas of moorland can be persuaded to do a good job. The work at present being undertaken by crofters 134
to improve moorland grazing is worth mention. Areas of land 311
have been given a surface application of approved compound 241
fertilizers, phosphates, lime or shell sand, and selected grass-seed 242
mixtures. The results are literally a sight for sore eyes, and bring Alexander Smith's 'green, pastoral land' close to realisation. Although individual crofters have taken advantage of the help given to regenerate rough grazings, the most spectacular results have been seen on the township common grazings; most of these have been fenced off and improved. Today, something like 14,000 acres of lush green pastures are steadily spreading over deep peat where formerly grew only sedges and brown heather.

To end this aspect of land use in Lewis on a historical note, 134
the story of re-seeding had its beginnings during the time of the 175*
Napoleonic Wars. A minister who had some land at Barvas, on 311
the west coast of the island, decided to attempt the reclamation 242
of useless heather-bound and bracken-choked land. He sanded the area with shell sand, seeded it with a good strain of grass and used sheep to tamp in the seed. One can imagine what Lewis would be like today if the Barvas minister's work had been followed up by Alexander Smith and those who set up the farm at Arnish.

3: Geddes K-4,5 (1919-1952) 1955 ES10 Highland Scots
Lewis and Harris

133 clay is exposed, leaving what is vividly called 'skinned'
314 land. And where drift is exposed, the mineral constituents
134 are leached out, and a hard 'moor pan' is left a few inches
[356] below the surface.

Seen from the edge of the crofts, the typical 'skinned
134 lands' of bare, blue or brownish clay, littered with stones,
137 suggest a desert. Often, only a few blades of grass or tufts of heather grow on them. Indeed, 'skinned land' seems at first too mild a term, for on it the stones—thickest on top when undisturbed, and bleached by the acids of the peat that overlay them—suggest the prophet's 'field of bones'. One can only ask, is the rest of his vision ever to be fulfilled and life to spring again? In some hilly parts to south and west, not only the 'skin', the topmost layer of peat, but the very soil, the flesh as it were, is still being
[166] stripped bare to the bone, the actual rock. The evacuation of the islet of Bernera Beag (Uig) was largely due to this stripping. In the more level parts to the north, however, roadside pits show sections of clay with few stones, covered with perhaps six inches of clay with many stones. It is this top layer which gives the skinned land such a hopelessly stony appearance, and shows that reclamation is less miraculous than it seems.

134 With the coming of carts and lorries the increasing use
of shell sand has become possible, whether for spreading
• 242 on the land or for slipping into pockets, together with
[178] fertilisers, for potato seed. As to soils, shell sand and
boulder clay possess complementary qualities in texture
[493] and chemical composition. The shell sand of the machars provided an early home for man, the light soil allowing rye, a poor variety of oats, and herbage, to ripen early and mature in late, wet seasons when the clays are sodden with rain. Yet the sand itself is so light that drought is

3: Geddes K-4,5 (1919-1952) 1955 ES10 Highland Scots
Lewis and Harris

• 242 a danger, and an unseasonable gale may blow away the
134 furrow and ridge with the seed. As a partial remedy, seaweed and turf are mixed with it. On the whole, landforms and soils, and the climate of the past which helped to make them, are factors of difficulty for plant and man.

4: Moisley et al. K-5 (1959) 1962 ES10 Highland Scots ES10
Uig

341 Many of the original houses are ruined or used as byres. Figure 14 shows that new
491 houses have been built near the sites of the old ones but sometimes nearer the road - all
[487] but four houses have easy access to the road. Crowlista is linked to the main road by
493 two miles of rough gravel side-road, and by a footpath and ford via Timsgarry. Vans call
225 but there is no Post Office, store nor bus service. At present water supplies are poor -
368 two wells only are in use.
[497]
[312]

Carnish is served by a short unmetalled road and all houses have good access to this. Water supply is good; water may be stored on the high part of the crofts and piped into the houses. The roads serving Timsgarry too, are unmetalled, but the main road is less than a mile away. This 'main road' from western Uig to Stornoway runs through Ardroil and all
[342] except one of the houses not near to it have good drives suitable for lorries. Ardroil has
225 a store and Timsgarry a Post Office. One butcher's and two grocers' vans call weekly
455 and the travelling bank fortnightly. The thrice-weekly bus service to Stornoway (return
[490] fare almost £1) ceased in 1960 because of competition from privately owned vans and cars.

241 The cultivated land is in strips usually large enough for horse or tractor work; the
[231] smaller potato patches are hand dug. Few horses are kept now, Timsgarry, Ardroil, and
[467] Carnish have one each and Crowlista none. Crofters hire these horses or tractors from Brenish or Enacleit. Oats and potatoes are the only crops grown in quantity, small patches of turnips are found and most crofters grow root vegetables. Kale was seen growing on one Ardroil croft; this was an experiment and seemed to be very successful. Bere and rye are no longer grown. Grass mixtures are sown in order to qualify for cultivation grants. Oats are undersown, or grass seed may be sown after the oat harvest, and left for hay for several years - some sown twelve years ago was said still to be giving very good hay, but on the whole very little grass is sown in Crowlista. The acreage of natural grass cut for hay varies a good deal with the weather and the time and labour available. Crofters find this difficult to estimate as well, as often small irregularly shaped pieces are cut, and the figures, therefore, may not be accurate. (Appendix A).

One excellent garden showed that a rich variety of vegetables, fruit and flowers can be grown if adequate shelter is provided and the time for cultivation is available, but few crofters have the necessary knowledge or interest.

• 242 Lime, dung and artificial manure are widely used, though on some Crowlista crofts
134 the compound fertilisers were in use for the first time in 1959. Shell sand is used on the
324 crofts which have peaty soil. Although it is agreed that seaweed and dung are the ideal fertilisers for potatoes, seaweed is only occasionally used. It is becoming difficult to obtain locally and much heavy work is involved.

231 Each of the thirty-five operative units which carry any stock at all has a cow for domestic milk supply and manure. If the family is large or many visiting relations stay on the croft during the summer the calf has to be sold early; otherwise it will be reared until the cattle sales in September or May. Only eight crofters had two cows; fifty years ago four were commonly kept. Only thirteen of the units had young cattle other than calves. One crofter was rearing a kid for milk.

The bull supplied for these townships and Mangersta is an Aberdeen Angus which is wintered on the Ardroil machair.

233 It was sometimes difficult to obtain factual information about sheep and it is difficult to generalise. Operative units without sheep were those where no suitable labour was available. In a few cases crofters considered that sheep were 'not worth the trouble' - but others were building up their sheep stocks. Individual flocks ranged from ten to two

5: Caird et al. K-5 (1958) 1959 ES10 Highland Scots ES10
Park

231 Table III reveals that there are 177 agricultural units with a souming; ten units are crofts in Glengravir without a souming and the remainder of the 219 units have no grazing rights. From this Table, it is clear that full stocking and overstocking increase with the size of the croft: the units of ten acres and over, on the basis of stock carry, would appear to be the most intensively
[469] worked. In all, just over half of the units take up their full souming. Table IV gives an
[561] analysis of employment ancillary to croft work for 141 of the 219 units and it would appear that
[887] neither ancillary employment nor age is significantly related to the intensity of croft working. Table V points to the fact that more full-time crofters are to be found on the larger units but that less than one in four of the younger and more active men are full-time crofters. Tables
[511] III, IV and V underline the fact that the larger units are also the more successful and it is significant that the larger units are almost all on the better land in the agricultural townships. The average size of holding in the agricultural townships is nine acres, compared with less than eight acres in the fishing townships, where the land is much poorer and the cultivable area much more restricted.

195 The trends in agriculture are illustrated by Tables VI and VII. The Crofters' Commission made
178 a survey of the crofts through the medium of Estate Factors in 1883; from Table VI it is evident
241 that the number of cattle was much higher at that time and that the cattle-sheep ratio in the
231 selected townships was 1:3 as compared with 1:25 in 1958. Table VII gives agricultural statistics for the parish of Loche as a whole; separate figures for Park are not available. Since 1913, radical changes in the crop and stock patterns have taken place; bere (Hordeum vulgare) has disappeared as a crop, and sown grass and permanent grass for hay have since 1947 become the leading crops. Horses have all but disappeared, and the cattle-sheep ratio has risen from less than 1:4 to 1:39 for the whole parish. Since 1938, cultivation in Loche Parish has declined by 36
[518] per cent. Large areas of lazy-beds, no longer cultivated, are visible landscape signs of these
[324] changes; seaweed, the sine quae non for lazybed cultivation, is no longer carried to the upper part of the crofts. In fact, many of the crofts no longer use seaweed as a fertiliser.

233 From the foregoing account, it is clear that there are two major agricultural problems in Park:
241 the lack of sufficiently large crofts with good arable land and an insufficiency of common grazing; these deficiencies bring in their train the problem of overstocking, and the existence of uneconomic holdings.

241 The more progressive crofters, significantly resident on the better crofts of the agricultural
• 242 townships, have shown how croft land can be improved by re-seeding and sowing down to grass,
176 practices which could be fruitfully extended throughout Park. In addition, several townships by co-operative effort, have reseeded small areas of the commons grazings with splendid results.

241 However it is clear that it is not possible for 219 viable agricultural units to be maintained on the present crofting area. The optimum size of croft which could maintain a family is a moot point, for the location and situation of a croft and the quality of the land and common pasture would all have to be taken into account in making an assessment.

231 This problem was referred to a practical agriculturalist who was asked to state what size of
241 croft and number of stock would be required to provide an annual income of £300, excluding croft
242 benefit (milk, eggs and potatoes consumed on the croft) and any costing for labour. To fulfil these conditions, one of the fishing townships was carefully analysed, and the expert came to the following approximations, assuming that the rules of good husbandry were in force after the croft had been brought up to a good standard of cultivation and re-seeding had been carried out where possible on the outrun and Common Pasture, and provided there was no overstocking, and that present favourable subsidies and prices continue:-

231 241 242

Size of croft: 6 acres arable, (3 in crop, 3 in sown grass), 18 acres outrun and rights in Common Grazing to carry:-

6 cows, 2 young cattle, 50 ewes, 12 wedders, 12 ewe hogge and a ram.

	Income	£		Expenses	£
231 241 242 434	Sale of 1 cow, 5 calves, 10 cast ewes and 3 wedders, and 28 lambs say	224		Rent, ram, service of bull, grass, oat, potato and turnip seed, manures and hand feeding say	98
	Sale of wool	33		Excess of income	300
	Subsidies on cows, calves and cropping	141			
	Total income	£398			398

In order to work such a croft efficiently, the tenant could not take regular ancillary employment and would require the assistance of his family at busy periods. If such holdings were formed in the particular township studied, the number of crofts would have to be reduced to almost one third of present total. Considering Park as a whole, the agricultural units would have to be reduced to half of their present number but this latter figure is only very approximate as it was based on general evidence. It is clear, however, that about 100 viable agricultural units could be maintained on the present crofting area of Park.

000 From a detailed study of the agriculture of Park one can only conclude that the present crofting situation is far from being an optimum one. Only reorganisation on a major scale could made crofting economic, and such reorganisation would have to be coupled with the development of a non-crofting sector of the community dependent on ancillary industry. The prospects for the growth of ancillary industry are discussed on page 12. Larger crofts might well evolve as a result of continued depopulation. In the meantime, a determined effort could be made in the spheres of re-seeding and pasture improvement, and in consolidating the existing non-adjacent pieces of certain crofts. A reduction of the sheep stocks, with an emphasis on quality instead of quantity, and the introduction of more cattle, narrowing the present 1:25 cattle-sheep ratio, are policies which could be followed with profit.

ANCILLARY OCCUPATIONS

464 In most crofting areas, ancillary employment is necessary to compensate for the low croft income: total dependence on the croft for a livelihood has never been characteristic of many crofting [161] areas except in times of privation. At the time of the abolition of run-rig, most crofting areas had [162] a greater population than the land could support, even at subsistence level, and as a result, on most estates, crofts were created smaller than the optimum size in order to give as many persons as 464 possible a share in the land. First the kelp industry and at a later period fishing, resulted in sub-228 divisions of crofts, already too small, and the establishment of a cottar and squatter population. In 423 the case of kelp, the landlord required as many hands as he could muster and in the hey-day of the 241 fishing industry, the land was a secondary consideration as meal could be bought with the proceeds of the catches.

161 In Park, it is noteworthy that the most congested areas in 1883 were the fishing townships and 162 that since 1901, when the decline in the fishing industry began, these townships have experienced 464 rapid depopulation. No other home-based ancillary industry has successfully filled the gap in the economy. In Park as a whole only 18 per cent of the total male population of insurable age (15-64) are full-time crofters today - a striking confirmation of the fact that ancillary employment in necessary. 000 However, not all such employment is available in Park: 47 per cent of the insurable male population

[Garyvard]

407 Only a fraction of the total arable land is cultivated by tractor and this is divided among seven crofts. In spite of an emphatic statement by one of these cultivators to the effect that he will never use it again, the use of the tractor will increase as soon as the pioneers are able to prove to their neighbours its capabilities and as soon as the lazy-beds are joined together, an improvement which has already taken place in Habost. The main objection to the use of the tractor by the disappointed user was the inevitable one that the yields were smaller than in former years when he had used the spade. The answer to this was given by one of the other pioneers, who thought that time saved could be devoted to some other profitable occupation, 242 for example, weaving. Six of the crofters practise a five-year crop rotation, sowing potatoes first, followed by oats under-sown with clover which for the following three years is cut for hay.

An interesting experiment has been that of the improvement of two acres of common grazing land by the road on the west side of the township, by nine of the crofters working together during the evenings. The work began early in Spring when 6 tons of lime, 10 cwts. of mineral phosphates and 8 cwts. of compound fertilizer were spread evenly over the land. The grass seed was sown in July, the most favourable time for sowing since there is less danger of a drought than earlier in the year, and more convenient too, in that the sheep had been gathered for shearing and 250 of them were available to be driven back and forth over the land to tramp the seeds in. In theory this land should be ready for grazing next Spring, but in practice it will be ready in November. It is planned to re-seed twelve acres in all.

231 Most crofters have a cow to provide milk for their own needs. The Black Poll bull at Gravir 234 is preferred to the other township bulls since its progeny command higher prices. Sales are held 432 in the district twice per year, once on the old lake-level on the east side of the township, and once 435 at Balallan. Prices for calves are normally better in Spring than at the Autumn sale, nevertheless prices offered tend to be low. Even so, it is usually to the advantage of the crofter to part with the animal rather than bear the cost of taking it back to the croft and wintering it there. Naturally there is some bitterness that the middlemen who buy these animals will sell them at much higher prices on the mainland at Dingwall. Sheep are normally sold in Stornoway to the butchers but also at the local sales.

241 Crofting is not in itself a lucrative form of employment and in most households there is at 434 least one other source of income. A majority of the crofters have regular employment, two 463 working in quarries or on the roads for the County Council, another is postman, three are weavers, 464 another both weaver and contractor, while yet another works in Antarctic waters aboard a whaling 464 factory ship for eight months of the year. Weaving is undoubtedly the most lucrative of the an-[238] cillary occupations, though the weavers are suffering at the moment from the slump in the Harris Tweed industry which is also affecting the prices for wool. Contracting is also a paying proposition for one or two persons only, since the amount of freight is obviously limited.

241 Most crofters own a small rowing boat and it is not uncommon to see half a dozen nets set to 226 catch mackerel and other demersal fish. There is not one large fishing boat, however, partly 501 because of the scarcity of fish near the coasts, and partly because of the isolation of the area and [228] the subsequent difficulty in marketing. The Fleetwood trawlers are regarded as pirates in the Minch, and one has to its credit the destruction of two long lines - the sum total of the tackle belonging to a local boat. To have eighteen pounds worth of gear lost in one night is ruin to a crofter-fisherman. Lobster fishing has died out at Garyvard though it could be quite extensively practised.

361 The main road from South Loche to Stornoway through the village has obviously had a profound 491 effect on the township. The sites of the old 'black houses' have been abandoned when new houses have been built, in favour of sites conveniently near to the road. The Road Age has greatly [241] limited man's capacity for carrying goods. This is well illustrated by the fact that the majority of crofters in Garyvard use artificial fertilizers, whereas they are scarcely used at all in Caversta where the road ends about 50 yards from the nearest house.

[Lemreway]

157 vulgaris is dominant. Ling, which can tolerate considerable soil water, often occurs with Nardus, Molinia, Scirpus caespitosus and Eriophorium. A few rowans, usually near the shore, and a few willows, usually within stone enclosures, are the only trees to be seen.

241 Of the thirty-three legal crofts in Lemreway, nine comprise less than five acres, while seventeen
423 are between five and ten acres. Of the remainder, only two exceed fifteen acres and one of these is 30 acres. Six unoccupied crofts are worked by persons other than their tenants, so actually the 290 acres of croft land are shared by twenty-seven holdings. The seventeen-acre 'outend' was originally divided between fifteen tenants but confused sub-letting has resulted in four separate holdings directly occupying nine acres, and working another four acres. Thus the outend today must be regarded as the monopoly of four 'unofficial' holders.

244 Little more than a quarter of the croft land is cultivable and even less is actually cultivated
931 today: Figure 9 illustrates the crofting year. The broken terrain and the stony nature of the soil has permitted the cultivation of tiny 'lazybeds' and the total cultivated area is now about 48 acres. Only the strips of land on the gentler slopes, where the soils are deeper, are now cultivated, but every croft shows signs of former, more extensive, lazybed cultivation, often covering at least two acres. For example, on the east side, natural hay is cut on the well-marked lazybeds at about 225 feet.

244 Oats and potatoes, 29.5 and 16 acres respectively, occupy almost all of the cultivated ground.
246 Most crofts grow about half an acre of potatoes and one acre of oats; both acreages have declined, the former with a declining population and the latter with a reduction in the numbers of cattle; hay has increased in importance. No bere is now grown, though before 1900 it was preferred to oats.
[642] Ruins of the bere mill, which ceased to function at the beginning of the century, can still be seen.
[715] Fifty-nine acres of natural grass are cut for hay but only four crofters had sown grass for hay in 1958, about three acres in all. Few vegetables other than potatoes are grown though carrots are said to grow well, and formerly turnips and cabbages were grown. The soil needs careful preparatio
251 to be productive and almost every crofter used some seaweed and at least twenty drew subsidies for i
[728] and artificial fertilisers in 1958.

281 Stock totals have declined recently but the township has 36 cows and 22 calves. Only one croft
[654] is without cattle and 22 of the 33 working units have a cow and a calf. The township has an Ayrshire bull on loan from the Department of Agriculture; one of the few remaining elements of the co-operati township system is that this animal is fed by the crofters, in rotation, during the winter.

All but two crofters keep sheep; stocks vary between ten and 120 per holding but the majority have about 23 ewes with ten lambs. Although numbers have declined recently, the 3,025 acres of very moderate common pasture support a flock of about 1,150 sheep, including about 650 breeding ewes and about 300 lambs.

283 The souming is not enforced in Lemreway and it is remarkable that the total stock tallies almost exactly to the souming. An examination of the sheep soum reveals that the stock of 917 (excluding lambs) considerably exceeds the sheep soum of 626. It is interesting that it is nearly always the working units of over 10 acres that are overstocked; of twelve such units, eight keep more sheep tha they are entitled to. Most of these crofts are grouped on the eastern side of the township where the crofts have a larger outrun.

311 Thus, while overgrazing is not so severe as in many townships, it represents a potential threat,
247 particularly if the common pasture is not improved. However, in 1958 ten acres of the common pasture have been enclosed and re-seeded. Six acres were sown with ordinary mixed grass seed, two acres with pelletted seed and two acres with pelletted and inoculated seed. The eleven crofters taking part in the scheme put on 100 tons of sand to help drain and aerate the peaty soil, 2½ tons of ground mineral phosphate and 2 tons of concentrated compound fertiliser, grades 1 and 2 - all of it by hand. The area was sown in May 1958: by the following August, there was a striking difference between it and the untreated pasture. Next Spring, eleven cows will be grazed on this area. With the success of this scheme, it is hoped that more of the crofters will co-operate in re-seeding further areas.

[Lemreway] [Orinsay]

228 The West Highland Survey Township Card[1] describes Lemreway as "predominantly a fish
196 township". The remains of an old curing station are visible today and until 1947 there werd
[434] boats operating from Lemreway. A declining market, increasing cost of gear for obsolesce
[445] and the lack of a landing stage led to the decline of the industry in this township. Today ther
[504] one fishing boat which lands its catch in Stornoway working with modern equipment, drift a
nets, it provides a regular income for a crew of six.

161 An examination of the population statistics proves interesting, especially when compared
162 those for Orinsay. Lemreway's resident population of just over 70 males and 70 females is considering that there are six unoccupied crofts. Eleven of the crofts have more than one h and the cottar population forms over a third of the total residents. More than two-thirds of resident population is in the two important age groups - between 15 and 64. With over forty resident males in the working age group, Lemreway provides a striking contrast to other cr townships in Park.

[463] Fourteen of these men are full-time croft workers, while nine others find work in ancill
241 occupations such as weaving and fishing. A further eight supplement their croft work with r
[288] employment - a postmaster and a postman, a bus driver, a lorry driver and several weaver
[228] over thirty people work away from the township permanently, fourteen in the Merchant Navy
[205] nine girls in domestic service, while a further nine engage in seasonal work.
[494]

[166] Emigration from the township has continued steadily with forty people leaving since 1939.
[169] Nevertheless, Lemreway has a larger proportionate resident population than most townships
[505]
[537]

Only four thatched houses are occupied and housing conditions generally are good. Ever
302 has electricity, but, with four exceptions, water has to be carried from springs and wells.
399 of the present houses were constructed in the 1930s and they are usually near to the road.
[472] of the old houses remain, some being used as byres, and these were built either along the sh
[461] up the slope in the shelter of the hills, where the house was near the sheep, the peat and the
Today supplies of food, peat and even seaweed are brought by road.
[491]

484 Mention must be made of the possibilities of the tourist trade in Lemreway with its most attractive situation and reasonable road connections. An approach has been made to the Scot Youth Hostels Association and while hostellers could not greatly increase the income of the r they would stimulate interest in the area. Accommodation for summer visitors, other than of the crofters, is difficult to find but it seems that at least three houses could be used.
[485]

000 It is possible to be optimistic about the future of Lemreway, as at the moment considerat
407 enterprise is being shown. A Ferguson tractor, bought this year by a man returning from w is an example. It is to be hired out and could be put to good use in some parts, especially n
311 outend. The attempt to improve the common pasture and the new extensions to neatly painted
242 all reflect a combined effort to improve conditions. The old economy of crofter-fisherman i being adapted to modern times and crofter-weaver, crofter-postman and crofter-bus driver contemporary employment combinations.
463

181 The pessimism and apathy noticed in many crofters is to be found in Lemreway but above is the impression of enterprise. If Lemreway can continue to adapt itself to changing conditi
000 it may be able to combat the 'drift to Glasgow' and continue as a successful community.

ORINSAY

Beth Blowers, Brenda Turner and John Wearmouth

131 Orinsay is a small crofting township clustered, in the form of a horseshoe, around the he
361 a sheltered bay on the northern side of Loch Shell. Most of the houses are situated within fif
241 of the shore on a narrow strip of level land, while the crofts extend from the shore on to the

ceptance of the potato, a much more productive and dependable 161 175
bsistence item than grain on Skye, made it possible for more 178 241
ople to live on less land. The introduction of a new industry, 464
lping, provided many with employment and freed them from com-
lete dependence on a subsistence economy. Vaccination reduced 757
he mortality rate, especially among infants whose chances of 165
eaching maturity and procreating were thus enhanced. Another 511
mportant factor was the Skyeman's share in the general pros-
crity of British agriculturalists during the early years of
he Industrial Revolution and during the Napoleonic Wars. An 423
specially important factor was the practice of subdividing 582
he land which made early marriage possible, in particular after
he installation of the crofting system. Finally, but by no 161
eans least significant, there was the persistence of many 175
ypical features of the culture in the days of the clan. The 178 182
entimental ties of kinship and attachment to the soil had
emained.

The population decrease, partially a result of the Skyeman's 161
nvolvement in the process of commercialization, was primarily 175
result of a failure to fully adjust to the higher, more 178 184
eterogeneous socio-economic level. By the end of the second
eriod of the modern epoch, 1845, the people had become hostages
o the potato and their own fertility. When the potato failed
hem, they had nothing to fall back upon, except the generosity
f their landlords. The cattle and kelp markets had collapsed
t the end of the Wars, and the subdivided land could not
roduce sufficient grain. The belief of many that the pop-
ulation had over-run the limited local resources was confirmed.

may need just one more dry day to finish his harvest. If the next day is the Sabbath, his one dry day may be two or three weeks away and the hay a sodden heap. Nor did the Sgiathanach, or any newcomer with a croft, change during the war despite all the pleas of the government for full agricultural production. This is the one time that the Older Order Amish slogan "And be not conformed to this world" fully applies to the island. Circumspect behavior on this day functions to remind the people of all the negations and all the sanctions which religion has bestowed on the culture.

As in the case of Communions, there has been a gradual lessening of the importance of Sabbitarianism, especially since the return of many young men and women from the war. Again, the rather spontaneous relaxation of the rules is most common in Portree. It does not have the encouragement of the ministers of any church nor the elders of any church, except the Church of Scotland. Thirty or forty years ago the ministers and the lay kirk officers had enough influence to stop the running of trains throughout the western Highlands, shipping in the Western Isles, and the Kyle-Kyleakin ferry on the Sabbath. Public transportation is still at a standstill on the first day of the week, but the Sunday papers appear in Portree after the evening services, despite all the efforts of the ministers. They come by car from Inverness, by row boat across the strait, and by car to the village.

Before the war no one in Portree would let their children out of the house, except to go to church with their

[Orinsay]

The future existence of the common pasture for grazing is being seriously endangered by overstocking. The souming is not enforced in Orinsay and the actual sheep stock exceeds the soum by 300 per cent. Peat-cutting is gradually destroying valuable grazing areas; in the last three years there has even been some peat cutting on the better grazing on the island. The dangers both of overstocking and of indiscriminate peat cutting cannot be overstressed.

No evidence was seen of attempts to improve the quality of the common pasture. The establishment of shelter belts would provide not only shelter but a means of stopping the peat from 'slumping' down slopes if they were carefully sited. Much of the common pasture could be improved by a hill drainage scheme and by re-seeding, after sanding and liming, a project well within the capacity of the resident labour force.

Good crops on a few of the crofts suggest that the land is not inherently sterile, however, and it would seem that if the holdings were reduced to a maximum of four, an economic existence might be feasible on these crofts. The stony nature of the soil limits the possibilities of tractor cultivation, but with an improvement in drainage, one might be used in the two valleys.

It is not so easy to be optimistic about the employment of surplus population resulting from such an enlargement of holdings, although a revival in the fishing industry could absorb most of the men. A present there are no looms in Orinsay and providing the Harris tweed industry can hold its own, there are possibilities in weaving. Seaweed is in plentiful supply, indeed Lemreway people also obtain supplies and should its quality prove adequate, the establishment of a processing plant would provide valuable employment.

Nevertheless it is becoming increasingly obvious that unless the holdings can be enlarged, whethe officially or by sub-letting, and some further employment created, Orinsay is liable to stagnate, and depopulation to continue. The township which was developed to relieve congestion is now itself congested.

SUMMARY AND CONCLUSIONS

The aim of the Glasgow University Department of Geography Crofting Survey is to record and analyse material relevant to the crofting districts, and in so doing provide a clear and impartial statement of the present situation. In inviting us to undertake a survey of Park, the Pairc Association hoped that a body of fact would be assembled and conclusions drawn which would assist the Association in their admirable aims of advancing the well-being of the area. Their two Progress Reports, of 1956 and 1957, indicate that they have already investigated many of the possibilities for development. This summary refers to Park alone, and, it must be emphasised that until the survey of crofting is completed, no final assessment of the Crofting Area as a whole can be made.

The district of Park is one of the more isolated and difficult crofting environments. The ruggedne of the terrain, the high proportion of land of very low agricultural value and sheer isolation make the existence of human communities precarious. In addition, many of the Park communities were first established as a result of population pressure in more favourable areas of Lewis, and the original small settlements grew rapidly as a result of a change in land use which was a national trend - the conversion of poorer areas from subsistence farming to an extensive sheep-rearing economy. The impact of this change came to Park in the form of the eviction of a large body of small farmers in favour of an extension of the grazing area. Thus the present conditions are a legacy of the relatively recent past, and of legislation, particularly in the Crofters' Act of 1886, which accepted, and tacitly agreed to the maintenance of a larger population than the land could reasonable carry[1]. Two World Wars and fluctuating economic factors have had repercussions in Park and resulted in a change in economic and social values, and depopulation has resulted: the 1951 population was 60 per cent of the 1911 total.

1. The Commissioners proposed that only holdings rented at £6 and over should have security of tenure, with a view to discouraging the perpetuation of grossly uneconomic holdings; in the Act, all holdings were given security of tenure.

migration scheme to be attempted. In 1923 sixty-eight families from the Isle of Harris, in the Outer Hebrides, were brought over to Skye and settled in Bracadale. Probably, close to 300 new holdings and in the neighborhood of 200 enlargements have been made since 1897. This clearly reflects the limited space available for crofting at the end of the "Clearances."

In addition to land settlement, the government has continued to stimulate improvements in stock breeding techniques and to foster more efficient land utilization. Credit facilities, by grant and loan, were offered to enable the crofters to purchase stock, especially sheep, and to build new cottages. Grants and subsidies, in an ever increasing number, have been made available to promote a fuller use of the land. Initially, under the Congested Districts Board, these facilities were devised specifically for the Highlands. By the time the Congested Districts Board was abolished, the crofters had become officially integrated with the national agricultural scene so that specific subsidies, grants, and loans were replaced with an opportunity to apply for assistance within the national program of agricultural development. Instruction in scientific methods of agriculture has been another continuing function of the government through a series of advisory services and, more recently, by a program of demonstration crofts and farms. Access to markets has similarly been facilitated by improving communications by land and, to a lesser extent, by sea.

Security and protection for the crofters has been another unfailing interest of the government. Again, with official integration, the scope of legislation has been extended to

[435] heifer (L1/10)." One family is said to have paid rent
[551] by being fiddlers for "the castle" (the home of Sir James Matheson), thus earning the patronymic, "Fiddler." Their income stopped abruptly when the fiddler at the time, a great-grandfather of descendants now living, converted to the Free Church and smashed his instrument.

In 1899 and in 1905 it was noted in the rent ledger that two crofters wanted "first chance of a vacant croft
[628] in the township." In the first quarter of the century,
[764] a conflict ensued between Shawbost and a neighboring township over the extension of a cemetery; land was too precious to take out of cultivation and give to the dead of another village.

173 A 65-year-old man recalls, "Men got their living
241 from the land and sea. They kept more cattle when I was
[233] young. They used the dung of the cattle to fertilize the
[237] soil. The entire croft was used. My father's croft was only 2½ acres, but he worked it well and harvested eight stacks of barley to see us through the year." There were
173 a number of kilns to dry grain, and mills along the streams
• 243 to grind the barley. The "old Norse mill" which was

(1) Stornoway stretches from the town north to Tolsta;
(2) Barvas from the north of the Island southwards, past Barvas village (WNW. of Stornoway) five miles further to Bragar;
(3) Uig covers the rest of the south-west coast; and
(4) Lochs, the remainder of the south-east coast.

131 133 Seen from the sea, the Island chiefly presents dark, gneissic, heath-fringed cliffs whose steep walls become gentle slopes towards the south as we enter the bays, sea lochs and firths which run far inland (Plates I to IV). As one sails northward along the east coast of Lewis, there are few hills to be seen, and these are below 1000 feet; most of the island is rolling moor, rarely rising above 300 feet. Here and there new houses stand out, the 'white houses' (*tighean geala*), which, however, are usually grey 342 or even dark in colour. These dwellings have generally been stone-built and were often slate-roofed; asbestos roofs are now common. Yet even when dark, these new cottages are conspicuous beside the low 'black houses' with their rounded forms of wall and roof, and with thatch overspread by a faint haze of blue peat reek, like the bloom 133 upon a fruit. Their plots of corn, though each may be so tiny as to appear but a spot at a distance, together form [243] a bright patch against the dark brown moor. In the sketch which forms the Key to the Map of Vegetation and Settlements (Fig. 8), an attempt has been made to bring the map and the landscape alive to the mind's eye, from the hills of North Harris north-eastward to the Butt of Lewis.

131 133 Turning the north cape of Lewis, 'the Butt', and sailing southwards along the west coast, we see hills increasing in height in the Uig district, rising to those of Harris with

"the lone shieling of the misty island". Traditional Gaelic songs tell rather of shielings grouped within hail, with their sweethearting and good cheer!

3. *Crops and Stock*, circa *1938*

As the thirties mark a transition between early conditions prevailing until 1919 and those of 1947–53 (Appendix I), the present tense is used.

Of the Island's 528,000 acres, including deer forests on the Harris border partly grazed, there are 24,000 acres of arable and grass land. Barvas parish leads with 6500 acres, then come Stornoway, Uig and Lochs, Harris being last with 3300 acres. Roughly one-third of the Island's arable and grass land, or 32 per cent, is permanent grass, chiefly machar, with a maximum of 39 per cent in Uig, but a minimum of 9 per cent in rocky Lochs, most of this on one small farm. About 10 per cent of the arable and grass land area is given to hay production; of this, rather less than one-third is rotation hay grown on the plough rigs or parks, and rather more than two-thirds is hay from permanent grass. Lochs, lacking machar, has 20 per cent hay, while Barvas, better off for machar, has only 4 per cent. Even this proportion of rotation hay shows an increase on the crofts since 1919. Stornoway parish, it will be noted, occupies an intermediate place, but if the facts for Point (Eye) district were contrasted with those for the villages along the machar, the differences between them would emerge clearly. As it is, they can be guessed from the vegetation map showing the machar. Oats is the chief crop, and occupies 33 per cent or just one-third of the arable and grass of the Island; excluding the permanent grass, it constitutes half the crop.

In Lochs it occupies only one-quarter of arable and grass. Barley, mostly four-row, or bere, is less important as a food today than formerly, and now occupies only 6 per cent, and, though it reaches 13 per cent in Barvas, with its machar, hardly any is grown in Lochs. Rye (*seagal*), still found in the machars of the Uists, is little grown in the Lews. Potatoes grow well everywhere, occupying about 15 per cent of the area, though townships with plentiful machar land grow most. Turnips are being gradually introduced, and though their liability to disease has somewhat discouraged the crofters, the proportion is now about 2·3 per cent. Cabbages occupy a small area (·1 per cent), latterly along with lettuces, carrots and the like.

Rotation hay and turnips being almost unused up to 1919, oats was grown repeatedly before rotation with barley or potatoes, and with no bare fallow. While heavy manuring maintained the fertility, the crop by July was ablaze with corn marigold (and other weeds) through which the thin oats struggled to rear its head. Thickly sown, the return was exceedingly small. Except for the machar (if any) there was no 'out-field' as elsewhere in old Scotland.

The smallness of the crofts and the poorness of the crops explain the very small total return. Hence little oats is now ground for meal and the potatoes do not last through the year, though few are sold. The low out-turn also explains why even fodder is scarce, though much more of the crop is secured for wintering than formerly. Summing up, a croft of 6 acres—though a little too large to be quite typical—includes a couple of acres of grass and hay, almost as much of oats, and the remainder bears potatoes and barley, with turnips, cabbages and garden produce.

In the past, the cropped land was unfenced and unwalled. At present, the rule is to encourage the con-

427 Tables 16 and 18 support the definition of a croft as a small livestock-economy unit,
311 primarily concerned with the provision of milk for the family and young cattle and wool for
231 sale. There are no cash sales of crops - the whole of the land-use is directed towards
[241] the subsistence of the crofter and his stock. The cereals (almost entirely oats) and the
[246] hay (occupying a very small proportion of land for a livestock farming region) are grown for winter fodder for the cattle and sheep. The larger part of the croft is given over to grazing - usually of poor to medium quality - which receives very little attention from the crofter. Less than one third of the holdings have sown grassland (and in these few cases it is normally less than half an acre) - a fact which suggests a passive rather than active attitude of the crofter towards his land.

[244] In addition, every croft has its own small potato plot - rarely more than half an acre to provide for family needs, and most crofts (58%) possess a vegetable garden - again for house use.

[433] Nearly all the crofts carry one or two cows - the second cow ensures a milk supply all the year round. Young stock are sold at one year to eighteen months old, rather than as calves - a result of the incentive offered by the calf-rearing subsidy. The milking stock is replaced very infrequently.

427 Where one croft differs from the next is in the numbers of sheep stock. Table 17
233 shows an even distribution of crofts with more than fifty and less than fifty sheep; but, in
[434] fact, over one third of all crofts have less than twenty-five sheep. Sheep are the only source of money income on the croft, except for the annual sale of the calf, and subsidies, and there is a considerable difference in the size of sheep stock between the truly subsistence and "retirement" crofts on the one hand and the "commercial" crofts on the other. Hence the souming figures, and here note the contrast between Valtos with the sheep stock equal to 111% of the soum and Kneep - 353%!

000 An attempt has been made in Figs 19 and 20 to relate the size of the stock carried on

People kept several cattle, some of which were dry most of the time. But because everyone was keeping cattle, milk could be gotten from a neighbor. One man was planting eight or nine hundredweights of potatoes before the war, some of which would be used to feed the livestock. "You couldn't buy milk then, so you had to keep a cow. And even though people were weaving, they weren't getting so much money as they are now. It was the barter system here for a long time. So they didn't have the money to buy feeding stuff. It was better to spend the time planting potatoes. Now of course there's more money in the weaving."

After the war, an act was passed which provided free milk for schoolchildren. Milk for the Shawbost school was supplied by a farm near Stornoway, and villagers first started buying the milk from the school milk van. A strike held by weavers during the war had increased the payments for weaving, and the barter system had stopped. More money was available. As the loom was more profitable, more people stopped keeping cows, and relied on their neighbors for milk, or got their milk from the van bringing milk to the school. And as the cattle got fewer, the market for bottled milk expanded. A dairy was started on the west side of the island in the mid-1960's which carries milk from Uig to Ness.

ECOLOGY AND PHYSICAL ENVIRONMENT

THE CROFTING TOWNSHIP

361 The crofting township is not quite akin to the English or Lowland village. Primarily it is a collection of dwellings of families who, as social units, gain their subsistence from the land surrounding the houses. The smallest number for a township is four
476 family units. A functional unit of four men was the minimum necessary for a boat crew, or for the teamwork necessary to cultivate land; co-operation was essential if all four families were to survive. And from this grew the same spirit of communal work which in Lewis is seen at its best in the efforts to reclaim peat bog and turn it into fertile grassland.

361 Hebridean townships come close to being the nearest approach
[565] to a classless society. The shape of a township is largely dictated by the nature of the surrounding land. The shape of most of those in Harris and in Lewis is either scattered or linear (houses disposed in line at varying distances from each other), with little natural
[491] cover, either plantation or scrub. Often the main road runs through the township; some have begun to develop lateral roads, to give, from the air, the appearance of planning on a grid system.
• 244 Where gardens are cultivated, the produce tends to be a summer vegetable supply for the household, little if any finding its way to
372 Stornoway shops for sale. Peat is the usual fuel, though in townships near to the centres of Tarbert and Stornoway coal is burned; the cost of freight, however, makes it expensive.

471 Most of the townships are owned by commercial companies; individual lairds own some five dozen; the remainder belong to public bodies and trusts. The actual distribution of ownership of land on the island is as follows. Harris is virtually owned by individual lairds; a small percentage is owned by commercial companies. The Lochs region of Lewis has a mixed ownership: commercial companies, lairds, and public trust, the former being the largest. Stornoway parish is wholly owned by public trust. The Ness district is virtually the property of commercial companies; a small fraction belongs to public trust. The Uig district is the same, the smaller proportion, less than 10 per cent, being the concern of an individual laird.

In Lewis, the public body mentioned is the Stornoway Trust,

AGRICULTURE AND FISHING

With the disappearance of the middlemen, their sub-tenants became tenants of the proprietor; and the descendants of these are most of today's crofters. Mr Thomas Knox, who became Chamberlain of Lewis in 1833, was examined before a Select Committee of the Houses of Parliament on the question of emigration from the island in 1841. At that time there were 1,913 small tenants on the island who paid yearly rents varying from 63s 9d to 72s 3d. He stated that the country produced sufficient corn for the use of the people in most seasons. The years 1836-7 were exceptional and outside relief became necessary. But he did not consider that any person in Lewis was poor who had a lot of land, however small, if it were sufficiently stocked. There were, however, in the island, small tenants occupying land unsuitable for raising grain; and in order to avoid such distress as had occurred in recent years he had advocated the emigration of about 6,000 people, the vacant ground to be put under sheep. This course had been followed in 1838, when five families numbering about seventy people were removed and the land they had occupied was converted into sheep farms.

In the end, however, only a small fraction of the proposed 6,000 persons ever left Lewis under Knox's scheme. Those who were left worked their land under a cloud of increasing distress, in a system which had them in an iron grip. Eventually the bubble burst, as indicated in Chapter 3. The pressure of social conditions, and the events of historical progress, were manifested first in the social action against the agricultural system and finally in the legislation which gave the crofter certain rights.

CROFTING CHANGES

In general, the island during the last century was able to support its population, failing to do so only when disease struck at the staple potato. Each family unit in the crofting township was self-sufficient in most grown produce and the milk products from the family cow. Very poor families grew potatoes only and depended on neighbours for milk. But when the potato crops failed, distress knocked at almost every door, the fishing communities on the island tending to relieve hunger by looking to the sea. The removal

[Seaforthhead]

161 Table XVII reinforces the idea that there is a striking dichotomy between the agricultural
162 and fishing townships. The former are characterised by a more stable population trend,
166 significantly fewer of the population in permanent employment furth of Park, and a smaller loss by
167 migration. In the fishing townships, where growth and decline have been equally meteoric,
241 there is a larger proportion of persons in permanent employment furth of Park, and migration
228 losses have been greater. It is also significant that there is a smaller natural increase of
232 0.5 per cent in the agricultural townships. The only township which shows a natural decrease over this period is Caibost, one of the fishing townships.

SEAFORTHHEAD AND SHIELDERNISH

Rachel A. Hirst

131 Seaforthhead and Shieldernish are separated by 4,485 acres of rough grazing, the former
361 lying on the northern shore of Loch Seaforth and the latter on the southern shore of Loch Erisort.

SEAFORTHHEAD

135 Seaforthhead, the most isolated of all the Park townships, consists of three crofts and a
361 gamekeeper's holding. The township boundary is situated between the 50 and 75 foot contours which at their furthest extent are only 150 yards from the shore. Immediately behind the road the land rises very steeply in rough uncultivable moorland covered with many boulders but generally below the road the land slopes gently at about 5-10 degrees, in places being
[247] completely flat. Here, however, the lazy-beds are very boggy and rushes have appeared in the ten years since cultivation ceased.

134 The soils are deep near the shore due to soil creep; higher up they are very thin and peat
137 accumulates to at least 3 feet both below and above the road. There is little cover; bracken is rare, but silverweed and heather, moorland sedges and grasses soon colonise disused lazy-beds.

241 Legally there are three crofts but only one is still cropped, the other two being used solely
[233] for grazing. There is, however, a gamekeeper's holding within the township boundary worked as a croft. The other two crofts are used as ancillary grazings to holdings in Airidhvruach and Balaiian and have not been lived on for forty years and ten years respectively.

[244] The chief crops are oats and potatoes, though the gamekeeper had a patch of turnips and the other croft had grown them during the last few years until 'finger and toe' developed.
[407] Patches, about half an acre in extent, are drained with stone drains and ploughed by tractor, after which potatoes are grown to clean the soil, followed by oats for one year and then sown hay for three to four years. This is not strictly adhered to and several lazy-beds appeared to be
[319] in natural hay. There is no peat-cutting on the crofts as peat is secured just outside the township fence on the common pasture. Lambing has been poor for the past two years being
[231] only 50 per cent in 1958; the stock carried is twice the sheep soum. The cattle, Highland and Ayrshire or Shorthorn crosses, are below the soum, but previously nine cows and followers have been kept.

161 There has been a great decrease in population and cultivation since the resettlement in
162 1886. In Seaforthhead and Shieldernish as a whole, there were twelve crofters before the
241
178

[Seaforthhead] [Shieldernish] [Habost]

161 suppression of the original townships opposed to six today. As a result, many lazy-beds, now
162 given over to natural grass, are being gradually encroached on by heather and juncus. Out
241 of the present population of twenty-three, one is permanently away and two have migrated
178 since 1939. There is a more healthy population structure, with a large number of males between 15 and 44, due to a large family having returned home and six children, five of school age.

361 In Seaforthhead and Shieldernish all settlement is below the road and house-sites are on
[349] slight elevations. At Seaforthhead is the reputed hunting lodge of the Seaforth's, 'Seaforth Castle',
[505] now ruined, but still showing signs of abnormal size and arrangement. When first settled,
[441] communication was by ferry (1820). Now a cart-track, deeply rutted, to Eisken Lodge gives
[178] access to the Tarbert-Stornoway road two-and-a-half miles away.

SHIELDERNISH

131 Shieldernish, also consisting of three crofts, is better situated on the Park and South Lochs
361 road. The three houses are situated on a well-drained northerly slope, half-way between the
432 road and the shore, but the three crofts are on better land and greater accessibility has led to better management and new ideas.

241 Cultivation in isolated patches reaches up to nearly 100 feet and the lazy-beds have been put
311 together to permit ploughing by horse or tractor. One croft grows neither oats nor potatoes,
[246] preferring to enclose two one-acre parks, re-seed them, cut the hay in June, and wean the
231 lambs on the aftermath. By next year, this crofter hopes to have enclosed and re-seeded a
[244] further acre and will then use the three in rotation. The other two crofts grow both oats and potatoes and one is also sowing down. The crofts average fourteen acres in size but although gentle slopes are extensive, the major part of the crofts is in permanent pasture. The total
[226] stocking of the Shieldernish crofts is below the souming. Fishing is now only for domestic use
[288] though there is a small jetty on No. 1. Part-time weaving is performed on two of the six crofts.

The future pattern would appear to progress to more grazing and less cultivation. Two out of the six crofts - both at Seaforthhead - are worked from outside the township and this isolated township, being difficult of access and having little cultivable land, is better suited to grazing. Shieldernish appears more suitable for enclosing parks for fattening lambs, as soils are deeper and slopes gentler, making the use of a tractor feasible. More could be got out of the crofts especially with fertilising and re-seeding for hay and pasture and growing
[285] fodder crops for wintering. It is hoped to fence the common securely, and then stock will be renewed - a great necessity. Daily communication with Stornoway also means that Shieldernish is better placed than Seaforthhead for a flourishing settlement. The crofts are certainly of a workable size - provided part-time work, such as weaving, is maintained, along with the grants from the Crofter's Commission.

HABOST

Rachel A Hirst

131 Habost is scattered around a small bay on the south shore of Loch Erisort. Settlement
133 stretches for over a mile encroaching on three small hills separated by wide, well-drained
241 valleys which soon rise to the dominating Craigeal (225 feet). Slopes are varied but tend to
361 flatten out at about 100 feet near the road and on this flat, most of the cultivation takes place.
[134] Nearer the shore, slopes are much steeper and on the hills there are bare rock faces and thin soils.

[Habost]

134 Drift is found near the shore and laps round the three hills nearly up to the road, pre-
dominantly heavy clay with small boulders; this is replaced above the road by peaty loam on rock. At one time, here was grown on the heavy drift. There is peat accumulation on the flat land near the road to a depth of about six feet and there are one or two peat banks.
137 Vegetation is poor; there is no bracken or cover and within the crofts, moorland grasses and sedges predominate on rough land, though there are many lazy-beds sown down to clover and cocks foot. On the hills heather predominates.

195 Habost is the oldest township in Park. In 1843 Maclennan came from Shieldernish and
692 took what are now Nos. 9, 10, 11, 12 and 13 and Ailean Tailear came from Taransay, Harris,
621 to No. 7. By 1886 there were thirteen crofts; in 1907 four cottars were recorded, three being there before 1886; in 1957, No. 11 which had been shared between two brothers since 1906, became legally 11A and 11B making fourteen crofts. There are also fourteen operative units, although two are worked from Kershader, both as 'hay and grazing' units, and two are worked as one unit within the township, for there are three non-crofting units.

241 Only sixteen lazy-beds are dug by spade, the rest have been drained with stone drains and
407 ploughed by tractor owned by one crofter who loans it out to Habost and Kershader. There are three 'Croftmasters' (hand-tractors) in the township but these are only heavy enough for
233 bringing in peats, hay and similar light work. The progressive Habost community has fenced off part of the common grazing, to keep the weaned lambs off the croft from August till November and so save fodder for winter when the croft land is open to grazing.

[244] Oats and potatoes alternate in the rotation, with a little sown grass for hay, sown in enclose
[246] parks of about one acre. The tendency now is to increase the number of parks, cut the hay in
231 June and build up the lambs on the new grass. Shell-sand is used to fertilise the parks but
[432] elsewhere artificials, such as superphosphates, 'potato manure', potash, nitro-chalk and lime
[221] are used in addition to dung and, near the shore, seaweed. Most of the hay is taken from old lazy-beds.

231 The land is heavily overstocked: the soum is equivalent to 79 cow units, and actual stock is
233 144, whilst the figures for sheep are 191 and 618 respectively, including the sheep stocked in
[432] Park Deer Forest by seven of the Habost tenants. Sales of cattle are held at Garyvard in Novem
[221] and May and sheep and lambs are sold in Stornoway. Lambing was poor in 1958, 50-75 per cent being general, but many breeding ewes and other sheep have died.

241 The only cultivation on the common land belongs to the unofficial holdings. Behind Craigeal
however, there are some old lazy-beds, a well and ruins of a hut, which has not been used sinc
[317] before 1852. There used to be shielings on the far side of the common on Beinn Bhuidhe and
[226] below Loch na Claite but these have not been used since 1888. Habost is one of the agricultural
[282] townships and fishing is only for domestic use; looms are to be found on only four crofts and
[493] trade is slack. One crofter has a lorry for contracting, carrying peats, fertilisers and stock to market and two have butcher's rounds in Lochs. There are two small stores.

361 Settlement is scattered, always on elevated ground, and in many cases the new house has
[512] been built in close proximity to the old house site. All have piped water either from the well or
[654] from a rain tank, drinking water being carried in the latter case. Grants from the Crofting Commission are enabling new building and improvements to be carried out.

[Kersh=der]

with heather and peat on the higher areas, hay is taken off 19.25 acres. Four acres, mainly for potatoes, are worked by spade but most of the cultivation is by tractor hired from Balallan or, in 1958, from Habost. Lazybeds are common and in some cases are carefully renewed, but the present tendency, reaching its extreme in a field of about two acres on one croft, is towards the formation of larger, ploughable fields for ease of tractor operation. Most cultivation is in sonas (a) and (b), with little development of (c) at present. The only crops are oats and potatoes, with some garden plots of cabbages, turnips and carrots. The potato main crop is generally Kerr's Pink (Golden Wonder on one croft), with a couple of rows of Skerry Blue or Edzell Blue for earlies. There is no memory of Black Oats (Avena strigosa), and here (Hordeum vulgare) has certainly not been grown since 1930, and probably not since 1909. The oats are grown exclusively for winter feed and are hand-threshed with stock and comb as the need arises; the last water mill in the locality went out of use since 1944, the last handmill in 1916; no grain has been sent to Stornoway since about 1930. Rotations are extremely irregular: some lazy-beds are still cultivated with alternate crops of oats and potatoes and have heavy seaware and manure fertilisation, but most other arable areas have some sort of oats, potatoes, oats, sown grass sequence. Fertilisers used are seaware and manure (ten crofts), manure (eleven crofts), shell sand (one croft), lime (ten crofts) and artificials - 'Potato manure' and sulphate of ammonia - on eight crofts. Artificial fertilisers and much of the seed are obtained through the Crofters' Agency.

The only two horses ever owned by this township were kept on croft 11 from 1936 to 1953. The plough was first introduced in 1936. When a tractor from Balallan became available for hiring in 1953, the horses were disposed of. The present soums are by cow, young beast and sheep per croft in proportion to rents and range from 3 cows, 3 young beasts, 69 sheep down to 1 cow, 1 young beast and 23 sheep. Eight crofts exceed their entitlement but no croft has less than half the souming and the deficiency is mainly in cattle, especially young beasts. On the other hand, no operative unit is entirely without cattle as manure is extremely important. Cattle are kept for domestic milk supply, and calves, having qualified for subsidy, are normally sold at 6 to 8 months. 10 acres of the common grazing were re-seeded in 1957 and the following rhythm for milk cows is developing:-

(a) As soon as the weather allows in May, the cows are put out in the park for about three weeks.

(b) Next, about 6 weeks are spent on the common grazing between the ring fence and the new outer fence erected in 1957.

(c) Back to the re-seeded park for about five weeks.

(d) Return to the crofts for the winter, being let out either to the park or to the common grazings whenever the weather is suitable.

The young beasts spend much of their time on the outer common grazings. As most of the crofts, beginning with one in 1938 and ending in sequence with 10, 11 and 12 probably in 1959, are fenced, the old arrangements for township commoning from 15th October to 10th May are now obsolescent. Another park was also fenced for general purposes and for weaning in 1957. Prices for calves and cattle are very low and this discourages cattle breeding; on the other hand, lack of winter keep enforces an occasional sale.

The rhythm of sheep husbandry is largely independent of that of cattle:-

(a) By 20th November all sheep, except possibly the lambs, are cleared from the crofts for the tupping of breeding ewes thereon till 31st December. Every crofter now keeps his own ram, exchanging it or buying another at least once in five years.

[Caverstr]

Each croft is fenced but has a gate giving access to the common grazing, in which each crofter holds an equal share. The township has no specially enclosed area for fanking or other purposes and no fixed date exists on which the crofters open their gates for winter grazing. Breeding ewes are normally brought in for tupping in mid-October and November when crops have been gathered, and lambing takes place in late March or April. After dipping and inoculation with vaccines for black leg, braxy and louping ill, the sheep are put out on the common grazing in the second or third week of May.

The 642 acres of common pasture support a sheep stock equal to the sheep soum, but the overall stocking is only 88 per cent of the total souming. Two crofts only exceed their individual soums, while the others are well below the number required for greatest efficiency. The grazing is, however, poor for summer pasture, owing to the lack of grass, but the heather is valuable for wintering the hogge. Lewis Blackface sheep are the predominant breed and the wool, clipped in July, is sold to the Stornoway mills and the animals themselves are sent to the slaughter house. The 1958 loss at lambing was exceptionally high owing to a cold, dry spring preventing the growth of grass for the ewes. More than forty lambs and thirty ewes were lost by the township last winter, a number four or five times greater than the average loss.

Six cows, two heifers and four calves are kept in the township and tethered most of the year on the crofts. Calves are born throughout the summer months, but whereas early-born calves may be sold in the Autumn at six months old, those born later must be wintered to eight months until the Spring sales. The cows are served by the Department of Agriculture Highland bull at Habost, but although good prices are obtained for beef cattle, it is felt that for the family milk supply, a dairy bull would produce a better strain.

In addition to keeping stock, oats are cultivated on five holdings and potatoes on six. In most cases the land under each crop is less than half an acre and nowhere does it exceed two acres. The land has been built up into lazybeds about six to ten feet wide, separated by open drainage channels and worked by the spade. There are only two holdings where a tractor (hired from Habost) is used and the acreage cultivated only amounts to three-quarters of an acre. Conditions are not altogether suitable for mechanisation at present, for the terrain is very uneven and broken up by marsh and steep faces of bare rock.

Neither Torista nor Caverstr is on a main road. The former is served by a track joining the road near Cromore, while the latter has a secondary road running as far as the township dyke, and an inferior footpath joining the main road at Garyvard. The lack of a good road within the dyke acts as a deterrent to the use of modern equipment and fertilisers. Byre manure is used on all the crofts and seaweed is brought from the shore and spread on the lazybeds. Artificial manures, used on only three crofts, must be carried over rough ground from the dyke. This lack of incentive to improve is perhaps even more marked by the fact that on one holding alone is a rotation practised - potatoes, oats undersown with clover, then hay for three or four years. Apart from this one instance, potatoes and oats are sown, perhaps alternately, on the same strips for many years. Natural grass yields the bulk of the hay and is often cut from lazybeds that were formerly cultivated. On one croft there is upwards of quarter of an acre where the old ridges can be seen to have a crescentic shape and are thought to date back more than one hundred years. A similar distance beyond the township dyke is a similar stretch of land, now colonised by heather.

Peat still forms the principal fuel and, apart from one half acre patch within the dyke, is cut on the common grazing, as near the road as possible in May and June, and later brought home by creel, bicycle or tractor. Three of the six operative units still have gardens and all keep up to twenty chickens; rowing boats for line fishing, solely to supplement the larders, are also maintained.

In 1841 population records show that there were twenty-two persons at Caverstr and seven at Torista. After 1881, when maximum figures of fifty-nine and nineteen were noted, there was a secondary peak in 1911 in Caverstr, followed by a steady drop to twenty in 1951 and eighteen in 1958.

[Caverstr] [Cromore]

The 1914-18 war had a marked effect on the Caverstr population - 16 out of 54 (29 per cent) left after 1911 and no re-population took place. Since 1939, seven people have migrated to Stornoway or the mainland, (16 per cent of the total 1939 population), and six of these were from Torista (i.e. 50 per cent of the 1939 Torista population); only one family now remains there. The demographic position is becoming more acute for there are no young married couples and no youngsters growing up. The girls have left to marry and most of the men have sought temporary or permanent employment elsewhere, for with better communications, education and the radio, the pull to the towns has become stronger. There are now only two people in the township who could be described as full-time crofters, earning no supplementary income by weaving tweed on commission from the Stronoway mills.

Caverstr is not one of the most progressive of the South Lochs townships. Although the crofts are fenced, the common pasture is not visibly delimited from either the Cromore or Garyvard pastures. At present, the grazing is fully stocked according to the soum, but the committee has not as yet initiated any re-seeding schemes. As the pasture is not of the best quality, some newly sown grass would benefit every crofter. Lack of manpower may in part account for this deficiency but even a small acreage of re-seeding would be a great asset.

The future position of the township is rather doubtful: it is not the best type of land for mechanisation and is badly served by communications. The future of Torista appears to be probably one of abandonment, unless it is more easily linked with Cromore. The possibility of a good road being built here is remote, as there is only one family to serve. The main part of Caverstr is also open to question. Amalgamation of the crofts would not necessarily make more efficient units for the present units are not used to their full extent. Amalgamation with Garyvard might benefit the township a great deal, as the Caverstr population is rather small to flourish in isolation. The future of Garyvard, Kershader and Habost is one of hope, but unless some change takes place soon, it is not difficult to see Caverstr, and Torista, following the same course as Calbost and in thirty to forty years being little more than grazing land.

CROMORE

G. Mary Swindell, B.A., and Dennis F. Fancett, B.A.

Cromore is situated on a peninsula between Loch Erisort and Loch Cromore. Approaching it from the access road, Cromore has the appearance of a nucleated settlement, but in fact each house is situated on the owner's croft. The crofts are so arranged that each has a portion of land on the more level surface of drift deposits; houses 1 to 20 stand at the junction of the drift and the Lewisian gneiss. Soils are poor and thin, and there are numerous outcrops of barren rock amongst the arable land. The natural vegetation is heather moorland with extensive patches of rushes and cotton grass, the pattern of most of the 'outrun' around Cromore.

The township comprises twenty-seven crofts and there are twenty-seven working units; two crofts are subdivided while another four form double crofts. In addition there are five cottars and the Schoolhouse feu. Outside the township dyke there are two feus and four squatters. The croft layout differs from most other townships as each croft is in four non-adjacent pieces, one piece around the house, another above Creag Cromore and two pieces on another area of enclosed land on the common. Two crofts on the eastern side of Loch Cromore, have most of their arable land around the croft-house while three crofts have only one share in the other area of enclosed land.

Until this decade all the land around the houses, and much of that above Creag Cromore, was regularly cultivated. Some of the lazy-beds on the higher land are being cut for hay this year but cultivation is limited to the land around the croft houses and is completely unmechanised. The only crops at present are oats and potatoes and these are usually grown in rotation. The crofters sowed

[Cromore] [Marivig]

butchers' vans call on Wednesday and Friday and a fish van once or twice during the week. Goods are also conveyed by the daily bus. Electricity was brought to the village about four years ago and the inhabitants now look forward to a supply of piped water in about two years' time. At present only three or four houses have bathrooms.

The crofts, when worked well, are good enough to provide the existing population with a satisfactory subsistence, but each family unit must have some additional source of income. It seems that the recent subsidies for fishing are good enough to attract fishermen from Cromore and one or two boats might be sent out from the bay if the quay were longer. Weaving has brought prosperity but, as the Park Association states in its Second Progress Report "there is not sufficient weaving available for the present number of weavers". The proposal to establish a spinning and processing plant in the Park District made in the 1957 Report, would undoubtedly be of great value to the people of Cromore. The village is sited in a most picturesque spot and one of the inhabitants suggested that a hotel built on Crobeg Farm would bring some benefit to the community. However, even if these three increased sources of income became effective, one wonders whether they would be sufficient to attract the younger generation, already urbanised by schooldays spent in Stornoway

MARIVIG

Pamela Gough, B.A.

Marivig is situated on the western and south-eastern sides of Loch Marivig, a small triangular sea loch opening to the north-east and sheltered from storms and swells by Torray Island, making the loch an ideal anchorage and harbour.

The land rises steeply from the shore of the loch for twenty-five feet to fifty feet, then slopes more gradually and irregularly, with frequent precipitous rock outcrops, for two hundred to five hundred yards to rise steeply to a line of low hills, two hundred and fifty feet to three hundred feet high, surrounding the loch. All crofts thus have an easterly or north-easterly aspect, not particularly favourable for agriculture, and only one has any appreciable area of level land uninterrupted by rock outcrops. Soils, derived from glacial drift, are unevenly distributed, thin, and very stony, and cultivable areas are thus small and widely dispersed.

The surrounding hills, which form part of the eight hundred and sixty-three acres of common grazing, are mainly covered with heather, moor grass or sphagnum bog, while the lower areas within the township are grassy, but drainage is poor, and rushes are widespread. Bracken is not yet a problem, and only small areas exist, mainly on the lower slopes of the western side of the loch. A few rowans and willows survive here also, but otherwise the area is devoid of cover.

There are twenty-four registered crofts in Marivig, twenty-two being inhabited, one vacant and worked by another crofter, and one worked from a house on the common. With the exception of two crofts, one of which is on the common, all the boundaries run from the township dyke, which closely follows the two hundred foot contour, to the sea in radial fashion (Fig. 4). The size of the crofts varies from 1.25 acres to 22.25 acres but only seven crofts and less than four or more than eight acres in size. No croft has more than three acres of land which has ever been cultivated, and few now cultivate more than one acre. There are thirteen cottars and squatters, five houses being on the common, three of them cultivating small areas adjacent to their houses.

Cultivation is exclusively by spade on the 'lazy-bed' system. Owing to the rocky nature of the terrain, the 'lazy-beds' are narrow, often only one or two yards wide. Potatoes and oats are grown in rotation, and hay taken from lazy beds left fallow. Very few crofters sow grass for hay or undersow their crops. Dung and seaweed are used as fertilisers, with potato fertiliser as the most general 'artificial'. Small enclosed gardens, often somewhat neglected, produce lettuce, carrots, cabbage and soft fruits on about half the crofts, but no garden produce is marketed.

In Lochs it occupies only one-quarter of arable and grass. Barley, mostly four-row, or bere, is less important as a food today than formerly, and now occupies only 6 per cent, and, though it reaches 13 per cent in Barvas, with its machar, hardly any is grown in Lochs. Rye (*seagal*), still found in the machars of the Uists, is little grown in the Lews. Potatoes grow well everywhere, occupying about 15 per cent of the area, though townships with plentiful machar land grow most. Turnips are being gradually introduced, and though their liability to disease has somewhat discouraged the crofters, the proportion is now about 2·3 per cent. Cabbages occupy a small area (1 per cent), latterly along with lettuces, carrots and the like.

Rotation hay and turnips being almost unused up to 1919, oats was grown repeatedly before rotation with barley or potatoes, and with no bare fallow. While heavy manuring maintained the fertility, the crop by July was ablaze with corn marigold (and other weeds) through which the thin oats struggled to rear its head. Thickly sown, the return was exceedingly small. Except for the machar (if any) there was no 'out-field' as elsewhere in old Scotland.

The smallness of the crofts and the poorness of the crops explain the very small total return. Hence little oats is now ground for meal and the potatoes do not last through the year, though few are sold. The low out-turn also explains why even fodder is scarce, though much more of the crop is secured for wintering than formerly. Summing up, a croft of 6 acres—though a little too large to be quite typical—includes a couple of acres of grass and hay, almost as much of oats, and the remainder bears potatoes and barley, with turnips, cabbages and garden produce.

In the past, the cropped land was unfenced and unwalled. At present, the rule is to encourage the con-

found in a Lewis village; but in the ten to twenty years before 1939, the so-called 'Harris' tweed industry spread enormously in Lewis, accompanied by the construction of large spinning mills in Stornoway which supply yarn to male weavers. One further activity, kelp-making, was important for a time, although—not being strictly a traditional task—it is not represented in the upper graph, nor yet in the lower one, having declined after 1825 and disappeared (in the Island) long before the present century. Such was the annual rhythm of seasonal labour prevalent during the last generation, and a hundred years before.

7. *Rural Changes in Diet, Dress and Inter-marriage, and in Mobility: 1919–39*

Many outward changes occurred in the twenty years after the close of the First World War. Till the Island was able to benefit from the commercial advances of the mainland, it had no adequate relief from the famines of early times; in recent years the quantity of food has been rather more adequate. With the import of new foods, the consumption of vitamins at first declined: there was greater consumption of white bread from Glasgow and less of fresh vegetables (as ruined garden walls bear witness), and less, too, of cod-liver oil with the cessation of cod-fishing. Latterly, fenced gardens with vegetables and lettuce are providing vitamins, and fresh fruit (unobtainable even after 1919) is commonly on sale all the year round, so that a more rational dieting, when it can be afforded, is tending to recover lost ground and perhaps more.[1]

[1] E. P. Cathcart (*et al.*), *Studies in Nutrition: an Enquiry into the Diet of Families in the Highlands and Isles: III, Lewis* (Medical Research Council, Special Reports, Series 242. H.M.S.O.), London, 1940.

natural zone, could not be extended. In any case, the reclamation of clay land tended to slacken as efforts turned to fishing and kelp-making. The introduction or increased growing of potatoes added to the human, but hardly to the animal, food supply. Finally, while the beginnings of medical knowledge and vaccination had aided the growth of population after 1750, veterinary science had made no progress, nor did it advance in the Island for many years to come. We may conclude that an average stock per Island family about 1720 was rather more than that of 1790, and the acreage relatively larger, while both were greater than the average of today, particularly in the Lews.

What, then, could a family have to eat, from such crops and stock? While in winter even now there is almost no milk to be had on a croft, and there would be little then, there was salt meat, dried or salted cod (or herring) and fish oil; oat and barley meal and some rye meal; cabbages; and, increasingly in the eighteenth century, potatoes. Martin included potatoes among the crops grown even on far St. Kilda in 1697. A century later it was written that the people of Uig, for instance, had, though 'unwilling', been induced to grow and eat them 'forty years before'; and the years tend to be under-estimated where changes are slow and memories long! But it was written of Harris that by June the meal and potatoes had mostly been consumed, "and such as cannot afford to purchase imported meal subsist chiefly on the milk of their cows and sheep, with what fish they may chance to catch, till their wants are relieved by the first fruits of their potato crops early in Harvest".

We conclude that with even less money but a little more grain the population in the Island had fluctuated about a mean for some centuries before, as it had in so

rigs. The rigs are numbered and then balloted for by a double ballot. First the men approach the hat in any order and pick out a number: this is to decide the order in which they will approach the hat in the second draw. The second draw then decides the number of the rig. The crofter retains the rig while this particular scatt remains in cultivation, usually for a period of two or three years. The machar is shared by the whole township. The crops grown include a light type of oats, barley, a little rye, and potatoes; and clover may be cut.

In the division of the machar for potatoes at Barvas, there are now no such hard-and-fast rules. The Common Grazings Committee select a certain area for cultivation and each crofter is allowed to take as much land as he requires within this area. This land is only cultivated for one year in six to ten years, and then reverts to grass. If cultivated for two or more years in succession there is a danger of the sand being blown away, and grass would be difficult to establish again. Potatoes are now the only crop grown on the Barvas machar.

Beyond the machar of the Isles lies the moor with its fringe of reclaimed croft land. By Carmichael's day this was held in individual portions, though, as he said, most of it was once held in 'farms' in run-rig practised by small units, not by the whole township. Why this difference between the arable of the machar and of the moorland? Carmichael did not explain it.

Three explanatory points are, first, that the whole cultivated land of the scatt or the machar is continuous, whereas the moorland is hummocky and boggy by turns, and cultivation is therefore patchy; secondly, that, unlike the stony clays, the light shell sand is easily forked or ploughed and needs no 'team' to plough it; and thirdly,

The minister
was cultivating potatoes and his family were eating them

175 as an example to the crofters who were still reluctant to adopt the new crop. Some 70
244 boats were fishing; this was mainly in Loch Roag for they were small open boats greatly
228 outnumbered in good herring seasons by boats from other parts of the kingdom. To
251 encourage curing, particularly of white fish, the proprietor had set up two storehouses
441 to supply salt; he, or his agents, were probably the only buyers - indeed John Knox, who
614 visited Lewis about 1786, tells us that the estate factor held a monopoly for trading in cattle, dried fish and other products. The absolute power of the clan chieftain seems to have survived in Lewis until impending bankruptcy forced the sale of the estate in 1844. But it was kelp, more than fishing, that helped to support the people of Uig in the late eighteenth and early nineteenth centuries. Lewis made little kelp compared with the
175 Uists, but the Loch Roag kelp was of particularly good quality and commanded more than
221 the average price. Further, many people from Uig migrated seasonally to make kelp in Harris and Uist. Thus even at this time, the intrinsic resources of the parish appear
233 to have been inadequate to support the population. In this connection it is worth noting
162 the change in the average stock held by each family since 1792 as shown in table 3.
178

Clearance and Congestion.

175 Even after the end of the tremendous boom in kelp, brought about throughout the
228 Hebrides by the Napoleonic wars, some production continued in Uig. In 1825, when the land rent of the old parish was £1,862, the proceeds of kelp, after deducting expenses,
175 yielded £1,010 to the proprietor. Thereafter it failed. Meanwhile Seaforth was attempting industrial developments and agricultural improvements. The former included short-
233 lived distilleries in Stornoway, the latter involved the removal of some small tenants in
166 order to introduce mainland farmers. For these Uig was particularly attractive, the extensive mountain pasture offering good prospects for sheep graziers. The exact dates
427 of the formation of the earliest farms are not remembered nor are they precisely recorded,
274 but at least as early as 1826 Alexander Macrae of Kintail had the tack of Scaliscro, with the extensive grazings (now partly occupied by Bernera summer pastures) east of Little Loch Roag. About 1823 the small tenants of Mealasta and Breanish were deprived of Mealasta Island, which suggests that a sheep farmer was already installed in that district. About 1838 all the small tenants were cleared out of Mealasta, six families being put into Breanish; the remainder are said to have been sent to America.

175 In Bernera island, Kirkibost was cleared about 1822, having been lotted in individual
427 crofts some years earlier. Thereafter Kirkibost formed part of the large farm of Linshader. Little Bernera, too, formed part of this farm. On the mainland, opposite Bernera, small tenants were cleared from the shores of Loch Roag (e.g. Stromo and Drovernish) in the early nineteenth century, and a tacksman was installed at west Earshader. Further east the small tenantry were cleared from Ceanhulavaig and Linshader.

175 By 1844 the kelp shores were almost valueless to the proprietor (though seaweed as fertiliser remained a vital necessity to the small cultivators, often working the same land year after year). In 1841 the Chamberlain of the Lews suggested to the Select Committee on Emigration that some 6,000 persons should emigrate because the land was inadequate to support them. In 1844, of necessity, Seaforth sold the island. The
162 population of Lewis was then 17,000 (Uig 3,316); little did the Chamberlain imagine that in the following ten years it would increase by 16%, and that by the turn of the century would reach almost 30,000, (Uig 4,463; Figure 8).

427 a legal croft; a squatter builds a house on the common grazing, and a feuar pays a feu-duty or
241 ground-annual to the proprietor. Such unofficial holdings with stock on the common grazing are "agricultural units" in the same way as the crofts, for in fact some cottars keep more stock than the crofters. In these classes are 84 families and 32 of them keep stock. Thus instead of 215 legal units, there are 219 working units[1]. The more usual situation in depopulated crofting areas, where the number of agricultural units is much smaller than the number of crofts, is certainly not prevalent in Park. The official pattern of crofting and the real pattern are very different indeed both in Park and throughout the Crofting Area.

Crofting Agriculture

241 By definition, the function of crofting is agricultural production. The small area of cultivable
433 land, the poverty of the immature soils and the inhibiting characteristics of the climate, severely limit the range of crops. Of the 1838 acres ofcroftland in Park, less than 400 acres are classed as arable land. The measurement of the arable land was carried out about 1850 but reclamation after that date increased the arable area. Only in the townships of Shieldernish, Habost, Kershader, (Figure 5), and Garyvard where there are deeper deposits of glacial drift, is ploughing practised; elsewhere cultivation is entirely in 'lazy-beds', a system of narrow ridges 4 to 6 feet in width, [242] separated by open drains, and cultivated by spade. Natural grass for hay is the chief crop, and and accounts for 52 per cent of the 638 acres of cropped land (See Table II). As only 400 acres of the croft land are classed as arable, some of this hay is taken from areas which were brought [244] into cultivation after 1850. Oats (26 per cent), occupy the largest cultivated area, followed by potatoes (13 per cent). The small area of sown grass (9 per cent) of which four fifths is cut for hay, is symptomatic of the low standard of husbandry: only one fifth of the agriculture units sow grass. The average cropped area per agricultural unit is only 3 acres and only one-third of the units have gardens in cultivation. The hay and oats are grown for winter fodder, and the potatoes for household use. No detailed conclusions as to the use made of the crofts for cropping can be drawn, as the potential of each croft is extremely variable, but the low proportion of sown grass is indicative of the husbandry. There is a clear distinction between the 'agricultural' townships (Seaforthhead, Shieldernish, Habost, Kershader, Garyvard and Caversta), and the 'fishing' townships (Cromore, Marivig, Calbost, Gravir and Glengravir, Lemreway and Orinsay) in the extent and utilisation of the arable land: one measure of this distinction is that 55 per cent of the units in the agricultural townships sow grass; the figure for the fishing townships is only 22 per cent.

241 More valuable conclusions can however be reached from a study of the stocking. With the exception
427 of Glengravir township, each croft has a defined soum, and thus the stock entitlement for each
433 operative unit can be calculated. By using the equivalence, the soum can be converted to "cow units". In Gravir, the soum is 1 cow and follower, and 8 sheep per £1 rent: the equivalence is 1 cow to 5 sheep. The number of cow units per £1 rent is therefore 2.6; in the calculation, followers are ignored. The actual stock of the agricultural unit can also be converted to cow units and thus a comparison can be made between the soum and the actual stock of each unit. The percentage of the soum taken up can thus be used as an indication of the extent to which the unit is worked.

In the Crofting Area, as in all Highland Britain, stock rearing is the main function of agriculture.
[434] In Park, all the agricultural income, subsidies for cropping excluded, is derived from cattle and sheep.

1 Of the 215 legal units, 28 are sublet: thus if there was no unofficial stock-keeping by cottars and squatters there would be 187 agricultural units. However, there are 32 additional stock-keepers and thus in fact there are 219 agricultural units.

LIFE TODAY

LIFE TODAY

As in other Highland areas, some of the island's problems have 114
become so deeply entrenched as to be intractable. They have been
the *raison d'être* of so many commissions and committees of in-
quiry that their existence is now almost forgotten by the islander
—if indeed he ever understood their nature. Some results have [621]
been seen, such as the Crofters Act of 1886 which gave High- [175]*
land crofters security of tenure, perhaps the most valuable [429]
measure of the last century or two. But somehow all things have
not progressed so well since that date; at any rate not so fast that
crofting, for instance, is now seen to be an economic form of
land use of benefit to both local community and nation at large.
Many problems have been virtually ignored by successive central [657]
Governments; at least, remoteness seems to qualify a topic for
the office 'pending' tray. It has yet to be fully realised that the
island, with other Highland communities, is part and parcel of
the area generally administered from London and Edinburgh,
and merits as much attention to its welfare as other European
governments, such as Norway, give to their remote mainland and
island communities.

As usual, charity and self-help begin at home, and one of the 178
most dramatic changes in island life has been the result of the [241]
agricultural revolution of recent years which is changing once-
brown moors to lush green pastures: reclamation by re-seeding.
This revolution is still going on. Lewis crofters in particular are
showing the way, with other Highland crofting areas following
suit. The change in the Lewis scene is being emphasised by the [245] •
planting of shelter-belts of hardy trees and the first of the new [313]
plantations of timber-producing trees. These show the promise of
the future: a lively future for a lively community. The fishing in- [228]
dustry also has a future, brighter on the horizon than it has been
for many a poor year. The Harris Tweed industry, the staple em- [288]
ployment-source in Lewis, is maintaining its ability to retain the
interest of the market. And tourism, once a perfunctory and [484]
casual affair, promises to emerge as a useful sector in the
economy. There are, in addition, many small pockets of native
initiative and enterprise which, given sufficient encouragement

175 that the spade and foot-plough (*cas chrom*) were used for
114 double the area ploughed. From Monro and from the
311 precise Statistical Accounts of the eighteenth century, it is
[241] clear that pony-drawn ploughs were usual in the smoother
[127] parts of Lewis. In North Harris are 'abundance of
[136] Deir'. We must not forget here that 'faire' and fertile
are comparative terms for the West. "Lewis is faire and
well inhabit at the coste, ane fertile and fruitful countrey,
for the maist part beire [barley], with 4 Paroche Kirkes."
[224] There is "ane castell callit Stornoway . . . with 3 salt
loches, very fine for take of herrings . . . [and] infinite fresh
water loches. In the Lewis there are 8 waters with take
of salmon. . . ." There were also "Whales . . ." In
"a cove 2 fadoms deep at the ebb sea, uses Whytuns
(whitings) to be slain with huiks", there were "very many
haddocks and Men with their wandes sitting [as today]
upon the Craiges of that cove, and Lades [boys] and Women
[136] also. . . . In this Ile there are many Sheip for it is very
guid for the same. For they lay furth ever one mures
and glens and never enters in a house and their wool is
bot anes in the zeire pluckit off them in some faultes."
[234] In Zetland wool is still plucked, not sheared.

The description of reclamation is specially worthy of
note: "In this countrey all is peit mossland at the Sea
cost, and the plaice where he wins his peitts this zeire
[year] . . . thcre he sawes his corne the nixt zeire, after
that he guidds it weill with Sea ware" [*i.e.*, improves or
• [245] manures it with seaweed]. On "Ellan Colm Cill [an islet
apparently on the east coast south of Stornoway at the
mouth of Loch Erisort] Macloyd of the Lewis has ane faire
Orchard, and he that is Gardener has that Ile [rent]
free. . . ."
175 Around the coast of Lewis no absolute limit is set to
185
311

34

137 exceptional. The largest is found in the glen between Portree
[34] and Loch Sligichan. Of the total area of Skye, approximately
447,000 acres, over 400,000 acres are rough grazing, incapable
of being tilled.

The scarcity of trees is an environmental feature
worthy of special consideration. More than the mere aesthetic
appreciation of the traveler is involved. The lack of shelter
is a crucial factor in limiting the variety of crops which
can be grown. There are three "forests," but they are deer
[34] forests without trees and with very few deer. Wooded areas
exist only where landlords or, more recently, the forestry
commission have planted for amenity, shelter, and anticipated
lumbering operation. Pollen analysis, from an archaeological
find,[7] and stumps, discovered in peat bogs,[8] suggest. a once
widespread natural forest of birch, hazel, elder, oak, and
pine. All that remains are a few small areas of birch and
hazel on peat-free slopes and on sheltered escarpments beyond
the reach of the cattle and sheep, and some residual oak woods
in Sleat. So sharp is the contrast of Sleat with the rest
of Skye in so far as vegetation is concerned that this
• [45] peninsula has come to be known as "The Garden of Skye." The
proprietor has played his part in the creation of this impression by

7James Ritchie, "A Keg of 'Bog Butter' from Skye and Its Contents," Proceedings of the Society of Antiquarians of Scotland, LXXV (1941), pp. 5-22.

8F. Fraser Darling, "The Ecology of Land Use," The West Highland Survey, pt. IV, p. 7.

35

137 planting birch, hazel, oak, juniper, larch, spruce, and short
• [45] pine. These are the usual trees found on the plantations.
Typically, the Sgiathanach prefers an unobstructed view to
trees. He may tolerate a mountain ash or elder near his house,
but he has little desire to be surrounded by woods.

The Climate of Skye

132 Lying in the temperate marine climatic zone and in-
flenced by the Gulf Stream, Skye is noted for its mild
winters and cool summers. The annual mean temperature range
is between 14 and 16 degrees. Temperatures above 70°F. and
below 40°F. are exceptional. Although frosts may be expected
from October into May, severe frosts are uncommon. In recent
years there have been two, one in 1954 and one in 1947. The
climate is not, however, to be considered moderate. The
spring is not appreciably warmer than the winter. With a
maximum noon temperature of 68°F. for August of 1953 (Struan),
it is hard to believe that summer exists as a season.
[34] Economically, these climatic features mean that the planting
and growing season is late and pasture growth is slow.

The outstanding characteristic of the climate is the
amount of rain. Rainfall varies from considerable to excessive,
depending on the locality and the year. The rainbearing winds
blow in from the south and southwest. Thus, in the lee of
the Cuillins, Red Hills and the ridge of Trotternish, the
annual rainfall approaches 80 inches. The driest area of Skye,
northwestern Trotternish, has an average annual rainfall of

246

246 FORAGE CROPS--specialized production of crops for animal fodder (e.g., hay, alfalfa, vetch); techniques of planting and harvesting; use of specialized tools, equipment, and machinery; organization of labor and production; processing (e.g., bailing); storage of product (e.g., in stacks, silos, barns); etc. See also:
Animal husbandry . . . . . 25 Barns and silos 343

31

178 purposes, to a community which, as an agricultural
311 entity, requires transfusions from the larger society,
is accompanied by patterns of specialization and
individuation. The following table (Table III) of
agricultural statistics for the parish of Barvas
demonstrates the change, over the past 100 years,
from intensive subsistence agriculture to specialized
production. From a broad-based subsistence use of
the croft (as revealed by the number of acres cultivated
for barley, potatoes and oats; and by the number of
cattle, especially milk cows), there emerges a tendency
[83] toward specialized production. The number of sheep,
[234] which require less attention than cattle, has increased
[241] since the late 1920's when the weaving of Harris Tweed
• [246] commenced in earnest; and around this time there also
occurs a differentiation in cultivation, between the
production of barley and potatoes (used largely for human
consumption) and the production of oats (used largely for
feeding livestock). After 1931 agricultural returns
[231] began to distinguish between beef and dairy cattle.
During the past ten years the number of beef cattle in
the parish of Barvas has increased.

241 An important factor which crofters on Lewis now
654 take into account when making decisions about their
[See p.ix--Analyst]

231 People kept several cattle, some of which were dry most
(224) of the time. But because everyone was keeping cattle,
(244) milk could be gotten from a neighbor. One man was
• (246) planting eight or nine hundredweights of potatoes before
the war, some of which would be used to feed the livestock.
511 "You couldn't buy milk then, so you had to keep a cow.
234 And even though people were weaving, they weren't getting
231 so much money as they are now. It was the barter system
288 here for a long time. So they didn't have the money to
437 buy feeding stuff. It was better to spend the time
planting potatoes. Now of course there's more money in
the weaving."

175 After the war, an act was passed which provided free
272 milk for schoolchildren. Milk for the Shawbost school
224 was supplied by a farm near Stornoway, and villagers first
178 started buying the milk from the school milk van. A strike
175 held by weavers during the war had increased the payments
178 for weaving, and the barter system had stopped. More
288 money was available. As the loom was more profitable,
468 more people stopped keeping cows, and relied on their
437 neighbors for milk, or got their milk from the van bringing
231 milk to the school. And as the cattle got fewer, the
272 market for bottled milk expanded. A dairy was started on
178 the west side of the island in the mid-1960's which carries
231 milk from Uig to Ness.
434
234

592 like to leave the loom for the time it took to look
241 after the sheep."
311
288

A fourth household consists of three unmarried
592 siblings in their 40's and 50's who recently sold their
231 cattle and now keep only sheep for their own consumption.
241 They cultivate a small amount of oats and hay to feed
(233) the sheep during the winter. The brother who was largely
• (246) responsible for taking care of the livestock is now
(288) "concentrating on the loom," and his brother works in
(463) the mill. Their sister, who used to work in hotels on
the mainland, now keeps house for them. Described as a
(402) "self-contained family," they have a tractor and a deep-
(404) freeze and take care of their peat and the harvesting
of crops by themselves. One of their crofts has become
654 too waterlogged even for grazing and was sold recently
423 to the son of a local crofter, not for agriculture but
as a prerequisite for applying to the Department of
Agriculture for a housing grant. Only tenants of crofts
can apply for such grants. As this particular croft is
too wet to be cultivated or used as a house site, the
only motive which the new tenant has to become a crofter
is to gain access to governmental subsidy.

592 The fifth household is composed of a retired couple
233 and their son and his wife and family. They have no
311 cattle, and use the crofts for grazing sheep.

233 Most of these people look
829 askance at the idea of Britain joining the European
648 Economic Community. "If the Common Market comes, that
654 means no more subsidy for livestock. That'll mean the
end of crofting. They'll get good prices for their
beef, but feeding stuff will be very expensive."

"I don't know much about the Common Market, but
I'm against it. They'll do away with the subsidies.
If it weren't for the subsidies, most people just
wouldn't bother with cattle and sheep; it wouldn't be
worth their while, the feeding stuff is getting so
• (246) expensive. The people here used to take in a hundred
bags or so of potatoes to feed the stock. But the climate
is so bad you don't know what kind of a return you're
going to get, and the work is so hard it just isn't worth
the bother, so people prefer to buy feeding stuff. And
if you spend more on feeding your animals than you get
for them, what's the use? Of course we've been here
all our lives. It would be hard to leave. But if the
weaving goes--"

"I was talking to my cousin in Glasgow. He says
the cattle are going to be the big thing with the Common
Market. The price of beef is going to go up. I don't
think people here can keep cattle if they don't get the
subsidy. They can't keep enough cattle, and they can't
be sure of a good price every year."

Appendix C

Balance Sheet of a Croft

*159 "The Muillear" has one croft and a two-acre buaile.
241 In 1970 he planted one-eighth of an acre with three bags
244 of potatoes, two of which he bought for L14/16, and
433 harvested 22 hundredweights. This was sufficient for
(435) his family's needs and provided some feed for his live-
stock for all but two months of the year. A small plot
is planted with cabbages, for domestic consumption.

Seven-eighths of an acre is planted with oats; one-
(311) and-a-half acres with grass and hay; and two acres
• (246) are used for rough grazing.
(233)

*159 The Muillear is interested in new ideas and techniques.
232 He goes to meetings and discussion groups sponsored by the
233 North of Scotland College of Agriculture, and has bought
prize rams from the mainland to improve his flock. He
tries to raise a few sheep using techniques of good husbandry
rather than a large flock which would be given less
effective care. He is teased by other crofters for "over-
feeding," and for keeping his sheep on the croft and the
township reseeding rather than out on the moor. "His sheep
get homesick when they get out of sight of the croft." He
wins the prizes at the Carloway Cattle Show each year, in a

*159 Costs:
435 L50/— (Fodder used from December to August;
• 246 a hundredweight bag costing L2/14 is
used almost every two weeks. Other
crofters do not use this much.)
(427) 8/— (Stack of oats)
(407) 6/ 8 (Oat seed for 7/8 acres)
(241) 6/— (Tractor hired)
(654) 9/— (Six hundredweights of fertilizer for
oats and grass. For a cropping grant
of L7/10, three hundredweights of
fertilizer must be put on each acre of
hay.)
L79/ 8

*159 Income: L165/14
434 Costs: 79/ 8
435 Profit: L 86/ 6 (or about L2 back for every L1 he inves

*159 Net cash income or profit from the croft thus
434 represents 9% to 10% of his gross earnings from weaving.
If computed as cash, uncalculated income from the croft
in the forms of garden vegetables and milk products
would raise the croft income by L30 to L40. In those
households that consume their own sheep, the croft
contributes an even greater amount.

181 "the lone shieling of the misty island". Traditional
538 Gaelic songs tell rather of shielings grouped within hail,
533 with their sweethearting and good cheer!

3. *Crops and Stock*, circa *1938*

178 As the thirties mark a transition between early condi-
241 tions prevailing until 1919 and those of 1947–53 (Appendix I), the present tense is used.

311 Of the Island's 528,000 acres, including deer forests
632 on the Harris border partly grazed, there are 24,000 acres of arable and grass land. Barvas parish leads with 6500 acres, then come Stornoway, Uig and Lochs, Harris being last with 3300 acres. Roughly one-third of the Island's arable and grass land, or 32 per cent, is permanent grass, chiefly machar, with a maximum of 39 per cent in Uig, but a minimum of 9 per cent in rocky
311 Lochs, most of this on one small farm. About 10 per cent of the arable and grass land area is given to hay
• 244 production; of this, rather less than one-third is rotation hay grown on the plough rigs or parks, and rather more than two-thirds is hay from permanent grass. Lochs, lacking machar, has 20 per cent hay, while Barvas, better
632 off for machar, has only 4 per cent. Even this proportion of rotation hay shows an increase on the crofts since 1919. Stornoway parish, it will be noted, occupies an intermediate place, but if the facts for Point (Eye) district were contrasted with those for the villages along the machar, the differences between them would emerge clearly. As it is, they can be guessed from the vegetation map showing
311 the machar. Oats is the chief crop, and occupies 33 per
243 cent or just one-third of the arable and grass of the Island; excluding the permanent grass, it constitutes half the crop.

311 In Lochs it occupies only one-quarter of arable and grass.
243 Barley, mostly four-row, or bere, is less important as a food today than formerly, and now occupies only 6 per cent, and, though it reaches 13 per cent in Barvas, with its
632 machar, hardly any is grown in Lochs. Rye (*seagal*), still found in the machars of the Uists, is little grown in the Lews. Potatoes grow well everywhere, occupying about 15 per cent of the area, though townships with plentiful machar land grow most. Turnips are being gradually introduced, and though their liability to disease has somewhat discouraged the crofters, the proportion is now about
311 2·3 per cent. Cabbages occupy a small area (1 per cent),
244 latterly along with lettuces, carrots and the like.

Rotation hay and turnips being almost unused up to
241 1919, oats was grown repeatedly before rotation with barley or potatoes, and with no bare fallow. While heavy manuring maintained the fertility, the crop by July was ablaze with corn marigold (and other weeds) through which the thin oats struggled to rear its head. Thickly sown, the return was exceedingly small. Except for the machar (if any) there was no 'out-field' as elsewhere in old Scotland.

The smallness of the crofts and the poorness of the crops explain the very small total return. Hence little oats is now ground for meal and the potatoes do not last
178 through the year, though few are sold. The low out-turn
• 246 also explains why even fodder is scarce, though much more of the crop is secured for wintering than formerly. Summing up, a croft of 6 acres—though a little too large to be quite typical—includes a couple of acres of grass and hay, almost as much of oats, and the remainder bears potatoes and barley, with turnips, cabbages and garden produce.

174 In the past, the cropped land was unfenced and un-
178 walled. At present, the rule is to encourage the con-

133 townships and at Islivig and Breanish, the peat is thin (or has been stripped) to reveal a
134 gravelly dirft,[1] free-draining on suitable slopes. In such places a black loamy soil has been developed by cultivation; the many ditches of lazybed cultivation are not necessary
241 and, if the area is large enough, it can be worked by tractor. Such soils, in the climate
407 of west Lewis, are eminently suitable for rotation grass, for hay or pasture, and much more could be done with them under knowledgeable management. Where shell sand has been blown inland on to peaty soils the natural top-dressing has had a remarkable ameliorating effect on texture and acidity. Such areas are all too limited, the most important are at Valtos, Kneep and Reef, and around Uig bay; smaller areas are at
134 Mealasta, Mangersta and Bosta (Bernera). The hill grazings are dominated by a thin heather cover, blue moor grass and, in wetter places, sphagnum and cotton grass. Sinc
134 the cattle population has been declining many older residents claim that the pastures,
237 particularly near the townships, have deteriorated, the proportion of grass declining and coarse heather increasing. "The hills that were green when I was a boy", said one, "are now black". Neglected arable and pasture land, too, soon reverts. Rushes and flags invade the ditches between the old lazy beds and, if the ground is at all waterlogged, soon invade the beds as well. Drier ground, if not well grazed, soon reverts to heather. The limited machairs are little better; almost devoid of humus, they show little development of soil profile, only a thin grey layer of turf roots; rabbits, or injudicious cultivation readily set off wind erosion. Only where the wind has provided a natural blend of peat and machair are conditions better. Such areas are very limited.

152 The climate is in many respects severe; no local statistics are available, but some for Stornoway and Benbecula are appended. The frequency of high winds has a bad effect on both vegetation and stock, but to some extent wind counteracts excessive moisture. Near sea-level, where all the townships are situated, frost and snow are almost unknown. Thus it is exposure to the wind that limits the outwintering of stock, not low temperatures; this suggests that if pastures could be improved in suitably sheltered places far more advantage might be taken of the relatively mild winter temperatures. It is believed that the sunshine record is particularly poor in the south, where clouds can frequently be seen hanging over the mountains when the sun is shining on Bernera and the area north
• 248 east of East Loch Roag. The relatively dry and sunny period which commonly occurs in
221 May and June ought to make for a good hay harvest; unfortunately the natural meadows, such as they are, are late starters, and the custom is to cut the grass when it has gone to seed. Thus hay is often being taken in September - one of the wettest months in the year

CHAPTER TWO

SOME HISTORICAL ASPECTS

172 Evidence of pre-historic and other early settlements in the parish is afforded by the occurence of standing stones, broche and duns. The Callanish circle and its satellites are by far the most remarkable ancient monument in the Hebrides, and testify to the former importance of the site even though today their precise significance may not be clear. Most of the duns are now little more than circular heaps of stones, but in that at
174 Dounе Carloway the double walls still stand to a considerable height. A later phase of
103 settlement is recorded in the place names, a very large proportion of which contain Norse
162 elements such as -nish, -vick, -bost and -shader; it seems probable that most of the present township sites have been more or less continuously occupied since Norse times.

7.

1. [Presumably the author means "drift"--Analyst]

427 Tables 16 and 18 support the definition of a croft as a small livestock-economy unit,
311 primarily concerned with the provision of milk for the family and young cattle and wool for
231 sale. There are no cash sales of crops - the whole of the land-use is directed towards
the subsistence of the crofter and his stock. The cereals (almost entirely oats) and the
[241] hay (occupying a very small proportion of land for a livestock farming region) are grown
for winter fodder for the cattle and sheep. The larger part of the croft is given over to
[246] grazing - usually of poor to medium quality - which receives very little attention from the
crofter. Less than one third of the holdings have sown grassland (and in these few cases
it is normally less than half an acre) - a fact which suggests a passive rather than active
attitude of the crofter towards his land.

[244] In addition, every croft has its own small potato plot - rarely more than half an acre
to provide for family needs, and most crofts (58%) possess a vegetable garden - again for
house use.

[433] Nearly all the crofts carry one or two cows - the second cow ensures a milk supply all
the year round. Young stock are sold at one year to eighteen months old, rather than as
calves - a result of the incentive offered by the calf-rearing subsidy. The milking stock
is replaced very infrequently.

427 Where one croft differs from the next is in the numbers of sheep stock. Table 17
235 shows an even distribution of crofts with more than fifty and less than fifty sheep; but, in
[434] fact, over one third of all crofts have less than twenty-five sheep. Sheep are the only
source of money income on the croft, except for the annual sale of the calf, and subsidies,
and there is a considerable difference in the size of sheep stock between the truly subsis-
tence and "retirement" crofts on the one hand and the "commercial" crofts on the other.
Hence the souming figures, and here note the contrast between Valtos with the sheep stock
equal to 111% of the soum and Kneep - 353%!

∞ An attempt has been made in Figs 19 and 20 to relate the size of the stock carried on

TABLE 18

	natural grazing	75.5	76.0	75.0

427 a legal croft; a squatter builds a house on the common grazing, and a feuar pays a feu-duty or
241 ground-annual to the proprietor. Such unofficial holdings with stock on the common grazing are
"agricultural units" in the same way as the crofts, for in fact some cottars keep more stock than
the crofters. In these classes are 84 families and 32 of them keep stock. Thus instead of 215
legal units, there are 219 working units[1]. The more usual situation in depopulated crofting areas,
where the number of agricultural units is much smaller than the number of crofts, is certainly
not prevalent in Park. The official pattern of crofting and the real pattern are very different
indeed both in Park and throughout the Crofting Area.

Crofting Agriculture

241 By definition, the function of crofting is agricultural production. The small area of cultivable
433 land, the poverty of the immature soils and the inhibiting characteristics of the climate, severely
limit the range of crops. Of the 1838 acres of croftland in Park, less than 400 acres are classed
as arable land. The measurement of the arable land was carried out about 1850 but reclamation
after that date increased the arable area. Only in the townships of Shielderaish, Habost, Kershader,
(Figure 5), and Garyvard where there are deeper deposits of glacial drift, is ploughing practised;
elsewhere cultivation is entirely in 'lazy-beds', a system of narrow ridges 4 to 6 feet in width,
[246] separated by open drains, and cultivated by spade. Natural grass for hay is the chief crop, and
and accounts for 52 per cent of the 638 acres of cropped land (See Table II). As only 400 acres of
the croft land are classed as arable, some of this hay is taken from areas which were brought
[244] into cultivation after 1850. Oats (26 per cent), occupy the largest cultivated area, followed by
potatoes (13 per cent). The small area of sown grass (9 per cent) of which four fifths is cut for
hay, is symptomatic of the low standard of husbandry: only one fifth of the agriculture units sow
grass. The average cropped area per agricultural unit is only 3 acres and only one-third of the units
have gardens in cultivation. The hay and oats are grown for winter fodder, and the potatoes for
household use. No detailed conclusions as to the use made of the crofts for cropping can be drawn,
as the potential of each croft is extremely variable, but the low proportion of sown grass is in-
dicative of the husbandry. There is a clear distinction between the 'agricultural' townships
(Seaforthhead, Shielderaish, Habost, Kershader, Garyvard and Caversta), and the 'fishing' town-
ships (Cromore, Marivig, Calbost, Gravir and Glengravir, Lemraway and Orinsay) in the extent
and utilisation of the arable land: one measure of this distinction is that 55 per cent of the units in
the agricultural townships sow grass; the figure for the fishing townships is only 22 per cent.

231 More valuable conclusions can however be reached from a study of the stocking. With the exception
427 of Glengravir township, each croft has a defined soum, and thus the stock entitlement for each
433 operative unit can be calculated. By using the equivalence, the soum can be converted to "cow
units". In Gravir, the soum is 1 cow and follower, and 8 sheep per £1 rent: the equivalence is 1
cow to 5 sheep. The number of cow units per £1 rent is therefore 2.6; in the calculation, followers
are ignored. The actual stock of the agricultural unit can also be converted to cow units and thus a
comparison can be made between the soum and the actual stock of each unit. The percentage of
the soum taken up can thus be used as an indication of the extent to which the unit is worked.

In the Crofting Area, as in all Highland Britain, stock rearing is the main function of agriculture.
[434] In Park, all the agricultural income, subsidies for cropping excluded, is derived from cattle and
sheep.

1 Of the 215 legal units, 28 are sublet: thus if there was no unofficial stock-keeping by cottars and squatters there would be 187 agricultural units. However, there are 32 additional stock-keepers and thus in fact there are 219 agricultural units.

[Marivig] [Calbost]

0 In conclusion, it may be said that the problem of Marivig's future, and that of other crofting townships, is not only one of adverse aspect, soil and weather conditions, and of distance from markets, but a problem of the population finding a stable and viable level where agricultural units are large enough to encourage the active and enterprising section of the population to remain, and a problem of finding capital to equip a modern fishing fleet.

CALBOST

Anne Cooper

1 Calbost is situated five miles to the north-east of Gravir on the Minch coast of Park. It occupies a basin-like hollow in the centre of which is Loch Dubh, and is open to the sea on the east. The croft houses are scattered over a shelf 50 feet above sea-level round the sides of the hollow and along the valleys which enter the township to the north and south-west.

The cultivable soil, a mixture of peat and well-drained gravelly drift, is on the higher ground, although here the rock outcrops in many places. On land formerly cultivated, bracken is spreading rapidly and now covers a large proportion of the surface, although twenty to thirty years ago it was unknown. Heather dominates the common pasture and rushes are widespread in the low-lying central area. There are a few willows and rowans round the old buildings, probably planted as wind-breaks.

Calbost was originally a single farm but the township was formed about 1820. The pattern of the crofts differs from the usual shore-to-dyke alignment, as six crofts were allotted extra land in the valley which enters from the north, when a part of the common grazing was brought within the township dyke. There are now fourteen crofts of which four are worked by resident crofters and two by squatters. The remainder are used only for hay and grazing and are sub-let to crofters in Calbost and other townships.

Cultivation is entirely by spade and of the 2.6 acres now in cultivation, potatoes account for 2.37 acres. The small acreage of oats reflects the greatly reduced cattle stock of only two cows and two calves. Approximately twelve acres of hay are cut as winter feed for the 225 sheep which graze in the township.

The lazy-beds in natural hay and the outrun are being rapidly encroached on by bracken. The prevalence of bracken, and the amount of work needed to clear it, is likely to deter any attempt at renewed cultivation.

Calbost was originally a fishing township in spite of its harbour being so exposed: boats have to be taken up on the shore instead of being moored in the bay. The decline of the fishing industry whic has prevailed in Lewis has contributed towards the almost complete desertion of Calbost, leaving only a few boats now used only for leisure purposes. Croft income is supplemented by only two of the men in the township, one a weaver and the other in the Merchant Navy. Although there are a few productive gardens, no attempt is made to market any produce.

The township dyke is very close to the settlement and in the past shielings were not so widely usec in Calbost as elsewhere. The cattle were instead brought near to the dyke for milking and allowed to graze on the common unattended. There are ruins of shielings to be found on the hills around Calbost but a more interesting feature is the second dyke; enclosures were made adjoining the main dyke and in the late summer the cattle were brought to fresh pasture within these dykes before the opening of the township gates. Following the opening of the gates the stock are free to wander over all crofts but there seems today to be a move towards the complete enclosure of the crofts.

[Lemreway]

vulgaris is dominant. Ling, which can tolerate considerable soil water, often occurs with Nardus, Molinia, Scirpus caespitosus and Eriophorium. A few rowans, usually near the shore, and a few willows, usually within stone enclosures, are the only trees to be seen.

Of the thirty-three legal crofts in Lemreway, nine comprise less than five acres, while seventeen are between five and ten acres. Of the remainder, only two exceed fifteen acres and one of these is 30 acres. Six unoccupied crofts are worked by persons other than their tenants, so actually the 290 acres of croft land are shared by twenty-seven holdings. The seventeen-acre 'outend' was originally divided between fifteen tenants but confused sub-letting has resulted in four separate holdings directly occupying nine acres, and working another four acres. Thus the outend today must be regarded as the monopoly of four 'unofficial' holders.

Little more than a quarter of the croft land is cultivable and even less is actually cultivated today: Figure 9 illustrates the crofting year. The broken terrain and the stony nature of the soil has permitted the cultivation of tiny 'lazybeds' and the total cultivated area is now about 48 acres. Only the strips of land on the gentler slopes, where the soils are deeper, are now cultivated, but every croft shows signs of former, more extensive, lazybed cultivation, often covering at least two acres. For example, on the east side, natural hay is cut on the well-marked lazybeds at about 225 feet.

Oats and potatoes, 29.5 and 16 acres respectively, occupy almost all of the cultivated ground. Most crofts grow about half an acre of potatoes and one acre of oats; both acreages have declined, the former with a declining population and the latter with a reduction in the numbers of cattle; hay has increased in importance. No bere is now grown, though before 1900 it was preferred to oats. Ruins of the bere mill, which ceased to function at the beginning of the century, can still be seen. Fifty-nine acres of natural grass are cut for hay but only four crofters had sown grass for hay in 1958, about three acres in all. Few vegetables other than potatoes are grown though carrots are said to grow well, and formerly turnips and cabbages were grown. The soil needs careful preparatio to be productive and almost every crofter used some seaweed and at least twenty drew subsidies for l and artificial fertilisers in 1958.

Stock totals have declined recently but the township has 36 cows and 22 calves. Only one croft is without cattle and 22 of the 33 working units have a cow and a calf. The township has an Ayrshire bull on loan from the Department of Agriculture; one of the few remaining elements of the co-operati township system is that this animal is fed by the crofters, in rotation, during the winter.

All but two crofters keep sheep; stocks vary between ten and 120 per holding but the majority have about 23 ewes with ten lambs. Although numbers have declined recently, the 3,025 acres of very moderate common pasture support a flock of about 1,150 sheep, including about 650 breeding ewes and about 300 lambs.

The souming is not enforced in Lemreway and it is remarkable that the total stock tallies almost exactly to the souming. An examination of the sheep soum reveals that the stock of 917 (excluding lambs) considerably exceeds the sheep soum of 626. It is interesting that it is nearly always the working units of over 10 acres that are overstocked; of twelve such units, eight keep more sheep tha they are entitled to. Most of these crofts are grouped on the eastern side of the township where the crofts have a larger outrun.

Thus, while overgrazing is not so severe as in many townships, it represents a potential threat, particularly if the common pasture is not improved. However, in 1958 ten acres of the common pasture have been enclosed and re-seeded. Six acres were sown with ordinary mixed grass seed, two acres with pelletted seed and two acres with pelletted and inoculated seed. The eleven crofters taking part in the scheme put on 100 tons of sand to help drain and aerate the peaty soil, 2½ tons of ground mineral phosphate and 2 tons of concentrated compound fertiliser, grades 1 and 2 - all of it by hand. The area was sown in May 1958: by the following August, there was a striking difference between it and the untreated pasture. Next Spring, eleven cows will be grazed on this area. With the success of this scheme, it is hoped that more of the crofters will co-operate in re-seeding further areas.

[Orinsay]

which rises steeply, exceeding 375 feet in the west and 150 feet t the north-west and north-east two glacially deepened valleys drain s being "drowned" by northward extensions of the loch.

Although peat covers most of the surface it is only in the hollows for even on the gentler slopes the peat cover is frequently so thin as sub-soil containing many stones and boulders.

Two rowans and a dozen willows represent the only tree growth. exposed in peat-cuttings suggest that woodland was formerly more e woodland disappeared as a result of human action or of climatic char it is certain that a century of overgrazing has not favoured natural r sedges and a little poor heather characterise much of the area, and capacity of much of the moorland. Bracken has established itself in of neglected croft land.

Orinsay is unique in Park, for the present township is entirely a In the early 19th century there was a settlement at the head of the lo were removed and the area enclosed and added to Crobeg sheep farm to establish fourteen crofts, but the applicants were requested to wa end of the war the return of many young men with a desire to settle ing in Lemreway. Several of them 'raided' the Orinsay area. At fi their own houses, and in 1922 the Department of Agriculture interve off fourteen legal crofts, and at the same time providing a good foot their neighbours, four other Lemreway families, comprising 26 peop a mile to the west of Orinsay. Here, however, the Department of A with the community remaining isolated, most of the settlers returne years, although one family remained until 1939.

Six of the crofts have an area of less than ten acres, six have be while the remaining two occupy eighteen and twenty-five acres: the l to the shepherd on the sheep farm. Three of these crofts are not oc other crofters, with the result that eleven operative units share 161

Only a small part of the croft acreage is actually cultivable: even The broken and rocky terrain combined with the peaty soil allows no of tiny lazy-beds. The total area now cultivated does not exceed 25 may have been nearer 40 acres.

Oats and potatoes are the staple crops, occupying 9 and 6½ acres croft acreages of these crops vary in relation to the requirements fo case of potatoes, to domestic consumption. Nevertheless to produce the soil requires careful preparation. A plentiful supply of seaweed is the most frequently used fertiliser, while a little sulphate of amm crofters use lime.

In the last two decades a marked reduction in the amount of oats decrease in the numbers of cattle and an increasing use of hay for fo 17½ acres of hay altogether are cut, and only five of the crofters sow

In August 1958, the township supported only 13 cows, 3 young be crofters have a cow and a calf, but three have no cattle at all, and o a sad commentary on the state of crofting in Orinsay, but a phenomen crofting areas.

245 ARBORICULTURE--specialized cultivation of trees and shrubs for their fruits, nuts, berries, or other edible products (e.g., apple, breadfruit, coconut, cacao, coffee, orange, raspberry, tea, hops); special care and treatment of each (e.g., grafting, picking, drying, packing); viniculture; silviculture (e.g., raising of trees for wood pulp, soil anchor, screens, shade, decoration); organization of labor and production; etc. See also:

[Seaforthhead] [Shieldernish] [Habost]

suppression of the original townships opposed to six today. As a result, many lazy-beds, now given over to natural grass, are being gradually encroached on by heather and juncus. Out of the present population of twenty-three, one is permanently away and two have migrated since 1939. There is a more healthy population structure, with a large number of males between 15 and 44, due to a large family having returned home and six children, five of school age.

In Seaforthhead and Shieldernish all settlement is below the road and house-sites are on slight elevations. At Seaforthhead is the reputed hunting lodge of the Seaforth's,'Seaforth Castle', now ruined, but still showing signs of abnormal size and arrangement. When first settled, communication was by ferry (1820). Now a cart-track, deeply rutted, to Eisken Lodge gives access to the Tarbert-Stornoway road two-and-a-half miles away.

SHIELDERNISH

Shieldernish, also consisting of three crofts, is better situated on the Park and South Lochs road. The three houses are situated on a well-drained northerly slope, half-way between the road and the shore, but the three crofts are on better land and greater accessibility has led to better management and new ideas.

Cultivation in isolated patches reaches up to nearly 100 feet and the lazy-beds have been put together to permit ploughing by horse or tractor. One croft grows neither oats nor potatoes, preferring to enclose two one-acre parks, re-seed them, cut the hay in June, and wean the lambs on the aftermath. By next year, this crofter hopes to have enclosed and re-seeded a further acre and will then use the three in rotation. The other two crofts grow both oats and potatoes and one is also sowing down. The crofts average fourteen acres in size but although gentle slopes are extensive, the major part of the crofts is in permanent pasture. The total stocking of the Shieldernish crofts is below the souming. Fishing is now only for domestic use though there is a small jetty on No. 1. Part-time weaving is performed on two of the six crofts.

The future pattern would appear to progress to more grazing and less cultivation. Two out of the six crofts - both at Seaforthhead - are worked from outside the township and this isolated township, being difficult of access and having little cultivable land, is better suited to grazing. Shieldernish appears more suitable for enclosing parks for fattening lambs, as soils are deeper and slopes gentler, making the use of a tractor feasible. More could be got out of the crofts especially with fertilising and re-seeding for hay and pasture and growing fodder crops for wintering. It is hoped to fence the common securely, and then stock will be renewed - a great necessity. Daily communication with Stornoway also means that Shieldernish is better placed than Seaforthhead for a flourishing settlement. The crofts are certainly of a workable size - provided part-time work, such as weaving, is maintained, along with the grants from the Crofter's Commission.

HABOST

Rachel A Hirst

Habost is scattered around a small bay on the south shore of Loch Erisort. Settlement stretches for over a mile encroaching on three small hills separated by wide, well-drained valleys which soon rise to the dominating Craigeal (225 feet). Slopes are varied but tend to flatten out at about 100 feet near the road and on this flat, most of the cultivation takes place. Nearer the shore, slopes are much steeper and on the hills there are bare rock faces and thin soils.

2: Thompson H-4, 5 (no date) 1973 ES10 Highland Scots ES10
Lewis and Harris

but their negligence even in ye article appears from their sending out annual above 2000 of wool out of the country unmanufacture.'

Harris was rented at £600. Exports were some 100 tons of kelp (£325), and the value of 250 black cattle exported alive, with 100 salted, was £445. Small quantities of cheese, wool, and the skins of sheep, otters and seals were exported. Grain was neither imported nor exported.

The plough, which is used here, and in most places of the long island, is of a very peculiar construction. Its length is but 4 feet 7 inches, and is drawn by four horses abreast. It has but one handle by which it is directed; the mold board is fastened with two leather thongs, and the soke and coulter are bound together at the point by a rim of iron. Beside kelp, there is little else manufactured, except a little coarse woolen yarn, and some blanketing, which they send yearly to Glasgow. They raise a little flax of which they make some coarse linen for their own use, but import all the fine linen which they consume. In the year 1756, an American vessel in distress was obliged to put out three hogsheads of lintseed in Harris, which was sown and afforded crops of lint which were above double the value of the usual crops. The east and west of Loch Tarbert in the Harris are every year revisited by the herring shoals. During the five years from 1743 to 1747, the west loch was the principal seat of the herring fishery. About thirty vessels from 18 to 40 tons, belonging to Campbelltown, Greenock, and Irvine, were completely loaded each of these years at this place.

With even a modest amount of business taking place, it was a natural step to establish commercial facilities. Stornoway men who once acted as agents became shopkeepers. The increase in the use of money attracted banks. During the Seaforth ownership of Lewis, the island had its own currency or notes, designed and printed from plates in the same style as the modern banknote. The wording ran: 'I promise to pay on demand to the Chamberlain of the Lewis or Bearer ONE POUND Sterling at the Counting Room here.' The notes carried a date and were signed by the proprietor, J. A. Stewart MacKenzie. It is not known for certain how long the notes remained in currency, when they ceased to be used, or even whether they were officially acceptable. At one time, as rare items, they fetched high prices from collectors. A number were

[Habost]

Drift is found near the shore and taps round the three hills nearly up to the road, predominantly heavy clay with small boulders; this is replaced above the road by peaty loam on rock. At one time, here was grown on the heavy drift. There is peat accumulation on the flat land near the road to a depth of about six feet and there are the ruins of two peat banks. Vegetation is poor; there is no bracken or cover and within the croftin, moorland grasses and sedges predominate on peaty land, though there are many lazy-beds sown down to clover and cock's foot. On the hills heather predominates.

Habost is the oldest township in Park. In 1843 Macleonan came from Shiolderish and took what are now No. 9, 10, 11, 12 and 13 and Aline Tallman came from Tarasay, Harris, to No. 2. By 1886 there were thirteen croftes; in 1907 four croftes were recorded, three being there before 1886; in 1957, No. 11 without land been shared between two brothers since 1906, became lately 11A and 11B making fourteen croftes. There is a disused non-operative unit; although two are worked from Kershader, both as 'hay and grazing' units, and two are worked as one unit within the township, for there are three tenants in the township.

Only stationary lazy-beds are cultivated by spade, the rest have been drained with stone drains and ploughed by tractor owned by one crofter who leases it out to Habost and Kershader. There are three 'Croftmasters' (hand-tractors) in the township but these are only heavy enough for bringing in peats, hay and similar light work. The progressive Habost community has fenced off part of the common grazing, to keep the weaned lambs off the croft from August till November and so save fodder for winter when the croft land is open to grazing.

Oats and potatoes alternate in the rotation, with a little sown grass for hay, sown in enclosed parks of about one acre. The tendency now is to increase the number of parks, cut the hay in June and build up the lambs on the new grass. Shell-sand is used to fertilize the parks but these are artificials, such as superphosphates, 'potato manure', potash, nitro-chalk and lime are used in addition to dung and, near the shore, seaweed. Most of the hay is taken from old lazy-beds.

The land is heavily overstocked: the sound is equivalent to 79 cow units, and actual stock is 144, whilst the figures for sheep are 191 and 618 respectively, including the sheep stocked in Park from Pairt and by seven of the Habost tenants. Sales of cattle are held at Garryard in November and May and sheep and lambs are sold in Stornoway. Lambing was poor in 1958. 50-75 per cent being general, but many breeding ewes and other sheep have died.

The only cultivation on the common land belongs to the unofficial holdings. Behind Craigiel, however, there are some old lazy-beds, a well and ruins of a hut, which has not been used since before 1852. There used to be shielings on the far side of the common on Baien Bhuidhe and below Loch na Ciste but these have not been used since 1888. Habost is one of the agricultural townships and fishing is only for domestic use; looms are to be found on only four croftes and tools in stock. One crofter has a lorry for contracting, carrying peats, fertilisers and stock to market and two have butcher's rounds in Locks. There are two small stores.

Settlement is scattered, always on elevated ground, and in many cases the new house has been built in close proximity to the old house site. All have piped water either from the well or from a rain tank, drinking water being carried in the latter case. Grants from the Crofting Commission are enabling new building and improvements to be carried out.

[Kershader]

with heather and peat on the higher areas, hay is taken off 19.25 acres. Four acres, mainly for potatoes, are worked by spade but most of the cultivation is by tractor hired from Balallan as in 1958, from Habost. Lazybeds are common and in some cases are carefully renewed, but the present tendency, reaching its extreme in a field of about two acres on one croft, is towards the formation of larger, ploughable fields for ease of tractor operation. Most cultivation is in small areas (a) and, with little development of (c) at present. The only crops are oats and potatoes, with some garden plots of cabbages, turnips and carrots. The potato main crop is generally Kerr's Pink (Golden Wonder on one croft), with a couple of rows of Skerry Blue or Edzell Blue for earlies. There is no memory of Black Oats (Avena strigosa), and bere (Hordeum vulgare) has certainly not been grown since 1930, and probably not since 1909. The oats are grown for thatching and for winter feed and are hand-threshed and winnowed. The last crofter to use the last water mill in the locality went out of use after 1914, the last handmill in 1916, no grain has been ground locally since about 1930. Rotations are not practised, potatoes are set on ridges, but at lambing was exceptionally high owing to a cold, dry spring preventing the growth of grass for the ewes. Most fertilisation, both about arable areas and on some sort of oats, potatoes, oats, sown grass sequence. Fertilisers used are seaweed and manure (ten crofts), marine sand (six crofts), shell sand (one croft), lime (ten crofts) and artificials - 'Potato manure' and sulphate of ammonia - on eight crofts. Artificial fertilisers and much of the seed are obtained through the Crofters' Agency.

The only two horses ever owned by this township were kept on croft 11 from 1936 to 1953. The plough was first introduced in 1936. When a tractor from Balallan became available for hiring in 1953, the horses were disposed of. The present seven are by cow, young heifer and sheep, per croft in proportion to rents and range from 3 cows, 3 young beasts, 69 sheep down to 1 cow, 1 young beast and 25 sheep. Eight crofts exceed their entitlement but no croft has less than half the crofting and the deficiency is mainly in cattle, especially young beasts. On the other hand, no operative unit is entirely without cattle as manure is extremely important. Cattle are kept for domestic use, for sale, for manure, for milk and calves, having qualified for subsidy, are normally sold at 8 months. 10 acres of the common grazing were re-seeded in 1957 and the following rhythm for milk cows is developing:-

(a) As soon as the weather allows in May, the cows are put out in the park for about three weeks.

(b) Next, about 6 weeks are spent on the common grazing between the ring fence and the new outer fence erected in 1957.

(c) Back to the re-seeded park for about five weeks.

(d) Return to the croft for the winter, being let out either to the park or to the common grazings whenever the weather is suitable.

The young beasts spend much of their time on the outer common grazings. As most of the croftes, amalgamating with one in 1938 and ending in sequence with 10, 11 and 12 probably in 1959, are fenced, the old arrangements for township commoning from 15th October to 10th May are now obsolescent. Another park was also fenced for general purposes and for weaning in 1957. Prices for calves and cattle are very low and this discourages cattle breeding; on the other hand, lack of winter keep enforces an occasional sale.

The rhythm of sheep husbandry is largely independent of that of cattle:-

(a) By 20th November all sheep, except possibly the tathes, are cleared from the croftes for the lupping of breeding ewes thereon till 31st December. Every crofter now keeps his own ram, exchanging it or buying another at least once in five years.

[Coverata]

Each croft is fenced but has a gate giving access to the common grazing, in which each crofter holds an equal share. The township has no specially enclosed grazing for young stock. Since 1939, seven people have migrated to Canada or to other parts of the Lewis and no fixed date exists on which the crofters open their gates for winter grazing. Breeding ewes are put out, sometimes, in the last week of August but more usually in mid-October and November when crops have been gathered and lambing takes place in late March or April. After dipping and inoculation with vaccines for black leg, brucy and lungy illness, the sheep are put out on the common grazing in the second or third week of May.

The 642 acres of common pasture support a sheep stock equal to the sheep soum, but the overall stocking is only 88 per cent of the total souming. Two crofts only exceed their individual soums, while the others are well below the number required for greatest efficiency. The grazing is, however, poor for summer pasture, owing to the lack of grass, but the heather is valuable for wintering the sheep. The sheep are shorn in the week before the annual sheep dipping and are then taken to the Stornoway mills and the animals themselves are sent to the slaughter houses. The 1958 lose at lambing was exceptionally high owing to a cold, dry spring preventing the growth of grass for the ewes. Most fertilisation, both about arable areas and thirty ewes were lost by the township last winter, a number four or five times greater than the average loss.

Six cows, two heifers and four calves are kept in the township and tethered most of the year on the common grazing, but some have been thereout the summer months, the calves are may be sold in the Autumn at six months old, those born later must be wintered to eight months until the following sale. The cattle are inspected by the Department of Agriculture Highland hall at Habost, but although good prices are obtained for beef cattle, it is felt that for the family milk supply, a dairy bull would produce a better strain.

In addition to keeping stock, oats are cultivated on five holdings and potatoes on six. Rotations are not practised and the area of oats under each crop is less than half an acre and potatoes is seldom more than one acre. The land has been built up into lazybeds about six to ten feet wide, separated by open drainage channels and worked by the spade. There are only two holdings where a tractor (hired from Habost) is used and the acreage cultivated only amounts to three-quarters of an acre. Conditions are not altogether suitable for mechanisation at present, for the terrain is very uneven and broken up by marsh and steep faces of bare rock.

Neither Toristu nor Caverata is on a main road. The former is served by a track joining the road near Cromore, while the latter has a secondary road running as far as the township dyke, and this inferior footpath, joining the main road at Garryard. The lack of good road within the dyke acts as a deterrent to the use of modern equipment and fertilisers. Byre manure is used on all croftes and seaweed is brought from the shore and spread on the lazybeds. Artificial manures, used on only three crofts, must be carried over rough ground from the dyke. This lack of incentive to improve is further more marked by the fact that no one has lazybeds in cultivation, nor practised - potatoes, oats undersown with grass, hay for three or four years. Apart from this one instance, potatoes and oats are sown, perhaps alternately, on the same strips for many years. Natural grass yields the bulk of the hay and is often cut from lazybeds that were formerly cultivated. On one croft there is upwards of quarter of an acre where the old ridges can be seen to have a crescentic shape and are thought to date back more than one hundred years. A short distance beyond the township dyke is a similar stretch of land, now colonized by heather.

Peat still forms the principal fuel and, apart from one half acre patch within the dyke, is cut on the common grazing, as near the road as possible in May and June, and later brought home by creel, bicycle or tractor. Three of the six operative units still have gardens and all keep up to twenty chickens; rowing boats for line fishing, solely to supplement the tarders,are also maintained.

In 1841 population records show that there were twenty-two persons at Caverata and seven at Nuista. After 1881, when both of the lazybeds on the higher land are being cut for hay this year but cultivation is limited to the land around the croft houses and is completely unmechanised. The only crops at present are oats and potatoes and these are usually grown in rotation. The crofters sowed

[Coverata] [Cromore]

The 1914-18 war had a marked effect on the Caverata population - 16 out of 56 (29 per cent) left after 1911 and no re-population took place. Since 1939, seven people have migrated to Canada or to other parts of the Lewis and, in the case of the total 1939 population, and six of these were from Toristu (i.e. 50 per cent of the 1939 Toristu population); only one family now remains there. The demographic structure of the township is, therefore, a direct result of the heavy mortality among married couples in the 1914-18 war period. The girls have left to marry and most of the men have sought temporary or permanent employment elsewhere, for with better communications, education and the lathe, pull to the towns has become stronger. There are now only two people in the township who could be described as full-time crofters, earning no supplementary income by weaving tweed on commission from the Stornoway mills.

Caverata is not one of the most progressive of the South Locks townships. Although the croftes are fenced, the common pasture is not visibly delimited from either the Cromore or Garryard pastures. The dyke is fully adequate for the purpose but it is not well maintained and many crofter has not as yet installed any re-seeding schemes. As the pasture is not of the best quality, some newly sown grass would be more profitable than the present rough grazing. Lack of manpower may in part account for this deficiency but even a small acreage of re-seeding would be a great asset.

The future position of the township is rather doubtful: it is not the best type of land for mechanisation and is badly served by communications. The future of Toristu appears to be probably one of abandonment, unless it is closely linked with Cromore. The possibility of a good road into the township being built here is remote, as there is only one family to serve. The main part of Caverata is also open to question. Amalgamation of the croftes would not necessarily make more efficient use of the land for the present units are not used to their full extent. Amalgamation with Garryard might benefit the township as a whole, but, as the Caverata population is rather small to flourish in isolation. The future of Garryard, Kershader and Habost is one of hope, but unless some change takes place soon, it is not difficult to see Caverata, and Toristu, following the same course as Calbost and in thirty to forty years being little more than grazing land.

CROMORE

G. Mary Swindell, B.A., and Dennis F. Fancett, B.A.

Cromore is situated on a peninsula between Loch Erisort and Loch Cromore. Approaching it from the access road, Cromore has the appearance of a nucleated settlement, but in fact each house is situated on the owner's croft. The crofts are so arranged that each has a portion of land on the more level surface of drift deposits; houses 1 to 20 stand at the junction of the inland and the Lewisian gneiss. Soils are poor and thin, and there are numerous outcrops of barren rock amongst the arable land. The natural vegetation is heather moorland with extensive patches of rushes and cotton grass, the pattern of most of the 'outrun' around Cromore.

The township comprises twenty-seven crofts and there are twenty-seven working units; two crofts are subdivided while another four form double crofts. In addition there are five cottars and the Schoolmaster fac. Outside the township dyke there are two fenc and four equatarys. The croft layout differs from most other townships as each croft is in four non-adjacent pieces, one piece around the house, another above Creag Cromore and two pieces on another area of enclosed land on the common. Two crofts on the eastern side of Loch Cromore, have most of their arable land around the croft-house while three crofts have only one share in the other area of enclosed land.

Until the decade all the land around the houses, and much of that above Creag Cromore, was regularly cultivated. Some of the lazy-beds on the higher land are being cut for hay this year but cultivation is limited to the land around the croft houses and is completely unmechanised. The only crops at present are oats and potatoes and these are usually grown in rotation. The crofters sowed

[Cromore]

The crofters sowed

clover with their oats in 1957; the quality of most of the natural grass could be improved considerably by a re-seeding this practice. Several of the croffers have taken advantage of the facilities for obtaining lime and fertilisers, but seaweed and manure are widely used, the former being used for vegetable plots this year but that of No. 23, (partially enclosed by a dry-stone wall) has produced crops of barley, cabbage and turnips.

The souming for Cromore is one cow, one heifer and eight sheep per £1 rental, but is not enforced. The crofters keep the stock which they can manage to maintain throughout the winter and are encouraged to be dissatisfied with this arrangement. In fact the souming is exceeded by only seven croffers and the total stock for the township is only 75 per cent of the soum. Lambing takes place in April and May and offer a high proportion of ewes and lambs is lost. The sheep are clipped in late June and after crofting tips are sent to the Stornoway mills. The cattle are then taken to spun in Stornoway before weaning it himself. The lambs are taken from the ewes during the second week of August and are fattened and sold in Stornoway and some are retained and wintered on their own ram. Most crofts have a cow and a calf and the croffers like the calves to be born in March so that they are ready to sell in October for the Garryard sales. The cattle are served by an Aberdeen-Angus bull from Crobeg Farm. The township gates are opened in October and the cattle remain outside until May. No interesting regulation enforced by the Grazings Committee is that each family can have only one sheep and that it cannot be taken on to the Common grazing without special permission, or on fash days.

Shielings, situated on the common grazing between Calbost and Cromore, were used until 1939 when the last shieling was abandoned because of difficulties in getting the cattle back in under cultivation and from an an air photograph, it is evident that hay was being taken on the strips above Cromore in 1946. The present trend is a continuing decrease in the area of arable land but this year ten croffers formed a group to enclose and improve a ten-acre plot on the common grazing; tread between Caverata and Grasvir, about three miles south-east of Cromore and one mile north of Grasvir.

Cromore was once a prosperous fishing village but now it has no fishing boats. Two Cromore fishermen work with other boats from Marivig and one from Stornoway and there are a few men who would welcome the opportunity to start fishing again. There seem little prospect of this. The landing-stage, completed in 1957, is regarded by many as a 'white elephant' and, in fact, at low tide it is useless. So much for the hopes that it might have been used by cargo vessels bringing goods to Park.

In Cromore there are fourteen looms for the weaving of Harris Tweed. Tweeds are obtained by the weaver from the merchant in Stornoway and one is woven for the merchant. At present the weaver is only one tweed per loom per week but the weavers could quite easily double their production. During the past two years this industry has been comparatively prosperous. Knitting is a winter pastime but only for pleasure, although one household possesses a knitting machine.

In common with the rest of Park, Cromore has a high proportion of old people. Many from the twenty-eight groups have sought employment on the mainland, and the teenagers, many of whom have been at school in Stornoway, seek jobs there or on the mainland, returning for holidays and assisting with the croft work. Some younger folk are resident to care of aged parents.

Cromore is only eight miles by sea from Stornoway yet all communications with the town are by road - a distance of thirty-two miles. There is a daily bus service and the sub-postmaster has a van which is occasionally hired. Some people recalled that the only route to Stornoway was once by boat to Crossbost and thence by bus. One resident owns a lorry and this is used for most of the haulage in Cromore, particularly for bringing home peats during the summer. As a result of recent improvements to the road, only three crofts remain inaccessible to vehicular traffic. There are no shops in Cromore but grocery vans call on Monday, Tuesday, Wednesday, Thursday and Saturday;

[Cromore] [Kertvig]

butchers' vans call on Wednesday and Friday and a fish van once or twice during the week. Goods are also conveyed by the daily bus. Electricity was brought to the village about four years ago and the inhabitants are now enjoying a supply of piped water in about two years' time. At present only three or four houses have bathrooms.

The croftes, when worked well, are good enough to provide the existing population with a satisfactory subsistence, but each family unit must have some additional source of income. It is felt that the recent subsidies for fishing are good enough to attract fishermen from Cromore and one or two boats might be sent out from the bay if the quay were longer. Weaving has brought prosperity but, as the Park Association states in the 1957 Progress Report 'there is not sufficient weaving available for the present number of weavers'. The proposal to establish a spinning and processing plant in the Park was discussed at the 1957 Report, weaving and knitting are well known in the people of Cromore. The village is sited in a most picturesque spot and one of the inhabitants suggested that a hostel could be built for tourists. Tourists would be welcomed but it is doubtful if even if these three increased sources of income became effective, one wonders whether they would be sufficient to attract the younger generation, already urbanised by schooldays spent in Stornoway.

MARIVIG

Pamela Gough, B.A.

Marivig is situated on the western and south-eastern sides of Loch Marivig, a small triangular sea loch opening out to the sea and sheltered from storms and swells by Torray Island, making the loch an ideal anchorage and harbour.

The land rises steeply from the shore of the loch for twenty-five feet to fifty feet, then slopes more gradually to the foot of the ridge, which forms the central portion of the township. It is five hundred yards to rise steeply to a line of low hills, two hundred and fifty feet to three hundred feet high, surrounding the loch. Land is scarce and the soil is poor and thin, but it is particularly favourable for agriculture, and only one has any appreciable area of level land uninterrupted by rock outcrops. Soils, derived from glacial drift, are unevenly distributed, thin, and very stony, and cultivated areas are thus small and widely dispersed.

The surrounding hills, which form part of the eight hundred and sixty-three acres of common grazing, are mainly covered with heather, moor grass or sphagnum bog, while the lower areas within the township are gravel, but drainage is poor, and rushes are widespread. Bracken is not yet a problem, and only small areas exist, mainly on the lower slopes of the western side of the loch. A few rowans and willows survive here also, but otherwise the area is devoid of cover.

There are twenty-four registered crofts in Marivig, twenty-two being inhabited and worked by another twenty-two families, one being used as a holiday home. With the exception of two crofts, one of which is on the common, all the boundaries run from the township dyke, which closely follows the two hundred feet contour, to the sea in radial fashion. (Fig. 4). The size of the croft varies from 1.25 acres to 22.25 acres but only seven crofts and less than four or more than eight acres in size. No croft has more than three acres of land which has ever been cultivated, and few now cultivate more than one acre. There are thirteen cottars and equatters, five houses being on the common, three of them cultivating small areas adjacent to their houses.

Cultivation is exclusively by spade on the 'lazy-bed' system. Owing to the rocky nature of the terrain, the 'lazy-beds' are narrow, often only one or two yards wide. Potatoes and oats are grown in rotation, and hay taken from lazy beds left fallow. Very few crofters sow grass for hay or undersow their crops. Dung and seaweed are used as fertilisers, with potash fertiliser as the most general 'artificial'. Small enclosed gardens, often somewhat neglected, produce lettuce, carrots, cabbage and soft fruits on about half the crofts, but no garden produce is marketed.

[Hartvig] [Colbost]

[500] In conclusion, it may be said that the problem of Hartvig's future, and that of other crofting
[501] townships, is not only one of adverse aspects, soil and weather conditions, and of distance from
[502] markets, but a problem of the population finding a stable and viable level where agricultural units
[503] are large enough to encourage the active and enterprising section of the population to remain, and
[504] a problem of finding capital to equip a modern fishing fleet.

CALBOST

Anne Cooper

[511] Calbost is situated five miles to the north-east of Gravir on the Minch coast of Park. It occupies
[512] a 'bite-in' like hollow in the centre of which is Loch Dubh, and is open to the sea on the east. The
[513] croft houses are scattered over a shelf 50 feet above sea-level round the sides of the hollow and
along the valleys which enter the township to the north and south-west.

[514] The cultivable soil, a mixture of peat and well-drained gravelly drift, is on the higher ground,
[515] although here the rock outcrops in many places. On land formerly cultivated, bracken is spreading
rapidly and now covers a large proportion of the surface, although twenty to thirty years ago it
was unknown. Heather dominates the common pasture and rushes are widespread in the low-lying
central area. There are a few willows and rowans round the old buildings, probably planted as
wind-breaks.

[516] Calbost was originally a single farm but the township was formed about 1820. The pattern of
the crofts differs from the usual shore-to-dyke alignment, as six crofts were allotted extra land
[517] in the valley which enters from the south, when a new part of the common pasture was allotted to
[518] the township dyke. There are now fourteen crofts of which four are worked by resident crofters
[519] and two by squatters. The remainder are used only for hay and grazing and are sub-let to crofters
[520] in Calbost and other townships.

[521] Cultivation is entirely by spade and of the 2.6 acres now in cultivation, potatoes account for
[522] 2.37 acres. The small acreage of oats reflects the greatly reduced cattle stock of only two cows and
[523] two calves. Approximately twelve acres of hay are cut as winter feed for the 225 sheep which graze
in the township.

[524] The lazy-beds in natural hay and the outrun are being rapidly encroached on by bracken. The
[525] prevalence of bracken, and the amount of work needed to clear it, is likely to deter any attempt at
renewed cultivation.

[526] Calbost was originally a fishing township in spite of its harbour being so exposed: boats have to
[527] be taken up on the shore instead of being moored in the bay. The decline of the fishing industry whi
[528] has prevailed in Lewis has contributed towards the almost complete desertion of Calbost, leaving
[529] only a few boats now used only for inshore purposes. Croft income is supplemented by only two of
[530] the men in the township, one a weaver and the other in the Merchant Navy. Although there are few
[531] productive gardens, no attempt is made to market any produce.

The township dyke is very close to the settlement and in the past shielings were not so widely use
[532] as Calbost as elsewhere. The cattle were instead brought near to the dyke for milking and allowed
[533] to graze on the common unattended. There are ruins of shielings to be found on the hills around
[534] Calbost but a more interesting feature is the second dyke; enclosures were made adjoining the main
dyke and in the late summer the cattle were brought to fresh pasture within these dykes before
the opening of the township gates. Following the opening of the gates the stock are free to wander
[535] over all crofts but there seems today to be a move towards the complete enclosure of the crofts.

[Lemreway]

[536] Frogiaris is dominant. Ling, which has interest considerable soil water, often occurs with Nardus
Stricta, Scirpus caespitosus and Eriophorium. A few rowans, usually near the shore, and a few
willows, usually within stone enclosures, are the only trees to be seen.

[537] Of the thirty-three legal crofts in Lemreway, nine comprise less than five acres, while seventeen
[538] are between five and ten acres. Of the remainder, only two exceed fifteen acres and one of these is
[539] 30 acres. Six unoccupied crofts are worked by persons other than their tenants, so actually the 290
acres of croft land are shared by twenty-seven holdings. The seventeen-acre 'noland' was originally
divided between fifteen tenants but confused sub-letting has resulted in four separate holdings directly
occupying nine acres, and working another four acres. Thus the noland today must be regarded as
the monopoly of four 'unofficial' holders.

[540] Little more than a quarter of the croft land is cultivable and even less is actually cultivated
[541] today. Figure 9 illustrates the crofting layout. The broken terraces are the most obvious feature of the soil has
permitted the cultivation of tiny 'lazybeds' and the total cultivated area is now about 48 acres. Only
the strips of land on the gentler slopes, where the soils are deeper, are now cultivated, but every
croft shows signs of former, more extensive, lazybed cultivation, often covering at least two acres.
For example, on the east side, natural hay is cut on the well-marked lazybeds at about 225 feet.

[542] Oats and potatoes, 29.5 and 16 acres respectively, occupy almost all of the cultivated ground.
[543] Most crofts devote about half an acre of potatoes and one acre of oats; both acreages have declined,
the former with a declining population and the latter with a reduction in the numbers of cattle; hay
has increased in importance. No have is now grown, though before 1900 it was preferred to oats.
[544] Ruins of the barn mill, which ceased to function at the beginning of the century, can still be seen.
[545] Fifteen acres of natural grass are cut for hay but only four crofters had sown grass for hay in
1958, about three acres in all. Few vegetables other than potatoes are grown though carrots are
said to grow well, and formerly turnips and cabbages were grown. The most needs careful preparation
[546] to be productive and almost every crofter used some seaweed and at least twenty drew substdies for 1
[547] and artificial fertilisers in 1958.

[548] Stock totals have declined recently but the township has 36 cows and 22 calves. Only one croft
[549] is without cattle and 22 of the 33 working units have a cow and a calf. The township has an Ayrshire
[550] bull on loan from the Department of Agriculture; one of the few remaining elements of the co-operati
township system is that this animal is fed by the crofters, in rotation, during the winter.

All but two crofters keep sheep; stocks vary between ten and 120 per holding but the majority
have about 23 ewes with ten lambs. Although numbers have declined recently, the 3,025 acres of
very moderate common pasture support a flock of about 1,150 sheep, including about 550 breeding
ewes and about 300 lambs.

[551] The souming is not enforced in Lemreway and it is remarkable that the total stock (allies almost
[552] exactly to the souming. An examination of the souming records shows that the stock of 917 (including
[553] lambs) considerably exceeds the sheep souming of 826. It is interesting that it is nearly always the
working units of over 10 acres that are overstocked. Of twelve such units, eight keep more sheep tha
they are entitled to. Most of these crofts are grouped on the eastern side of the township where the
crofts have a larger outrun.

[554] Thus, while overgrazing is not so severe as in many townships, it represents a potential threat,
[555] particularly if the common pasture is not improved. However, in 1958 ten acres of the common
[556] pasture have been enclosed and re-seeded. Six acres were sown with ordinary mixed grass seed,
two acres with pelleted seed and two acres with pelleted and inoculated seed. The eleven crofters
taking part in the scheme put on 100 tons of sand to help drain and aerate the peaty soil, 2½ tons of
ground mineral phosphate and 2 tons of concentrated compound fertiliser, grades 1 and 2 - all of it
by hand. The area was sown in May 1958; by the following August, there was a striking difference
between it and the untreated pasture. Next Spring, eleven cows will be grazed on this area. With th
success of this scheme, it is hoped that more of the crofters will co-operate in re-seeding further
areas.

247

[Drinaig]

[561] which rises steeply, exceeding 375 feet in the west and 150 feet to the north and east. From
[562] the north-west and north-east two glacially deepened valleys drain southwards, their lower ends
[563] being "drowned" by northward extensions of the loch.

[564] Although peat covers most of the surface it is only in the hollows that it is significantly deep,
far even on the gentler slopes the peat cover is frequently so thin as to expose a layer of morainic
sub-soil containing many stones and boulders.

[567] Two rowans and a dozen willows represent the only tree growth, but tree stumps frequently
exposed in peat-cuttings suggest that woodland was formerly more evident. Whether this former
woodland disappeared as a result of human action or of climatic change it is not possible to say, but
it is certain that a century of overgrazing has not favoured natural regneration. Moorland grasses,
sedges and the common heather characterise most of the area, and reflect the poor nutritive
capacity of much of the moorland. Bracken has established itself in one limited area on a patch
of neglected croft land.

[568] Orinsay is unique in Park, for the present township is entirely a twentieth century development.
[569] In the early 19th century there was a settlement at the head of the loch, but in 1843 the residents
were removed and the area enclosed and added to Crofteg sheep farm. In 1916, there was a proposal
to establish fourteen crofts, but the applicants were requested to wait until after the war. At the
end of the war the return of many young men with a desire to settle down led to serious overcrowd-
ing in Lemreway. Several of them 'raided' the Orinsay area. At first living in huts, they built
their own houses, and in 1922 the Department of Agriculture intervened, recognising and fencing
[570] fifteen acres of natural grass are cut for hay but only four crofters had sown grass for hay in
their neighbours,four other Lemreway families, comprising 26 people, went to Stimreway, about
a mile to the west of Orinsay. Here, however, the Department of Agriculture did not intervene and
with the community remaining isolated, most of the settlers returned to Lemreway within three
years, although one family remained until 1939.

[571] Six of the crofts have an area of less than ten acres, six have between ten and fifteen acres,
while the remaining two occupy eighteen and twenty-five acres: the largest croft originally belonged
to the shepherd on the sheep farm. Three of these crofts are not occupied, although worked by
other crofters, with the result that eleven operate units under 15 acres.

[572] Only a small part of the croft acreage is actually cultivable:seven less is cultivated in practice.
[573] The broken and rocky terrain combined with the peaty soil allows nothing but the cultivation by spade
of tiny lazy-beds. The total area now cultivated does not exceed 25 acres, although in the past it
may have been nearer 40 acres.

[574] Oats and potatoes are the staple crops, occupying 9 and 6½ acres respectively in 1958. Individual
[575] croft acreages of the main crops vary in relation to the requirements for winter stock-feed, and in the
[576] case of potatoes, to domestic consumption. Nevertheless to produce even these meagre returns
[577] the soil requires careful preparation. A plentiful supply of seaweed is obtained from the shore and
is the most frequently used fertiliser, while a little sulphate of ammonia is applied. Only two
crofters use lime.

[579] In the last two decades a marked reduction in the amount of oats grown has accompanied a
[580] decrease in the numbers of cattle and an increasing use of hay for fodder. Nevertheless only about
17½ acres of hay altogether are cut, and only five of the crofters sow any grass seed.

[581] In August 1958, the township supported only 13 cows, 3 young beasts and 8 calves. Half of the
crofters have a cow and a calf, but three have no cattle at all, and one even seed condensed milk.
a and commentary on the state of crofting in Orinsay, is a phenomenonby no means uncommon in
crofting areas.

TRADE AND INDUSTRY

[824] useful crofting ancillary which, unlike many others, is soundly
[381] based on a definite commercial demand. Various industries use
the extracted acid for some 150 products. The Scottish alginate
industry, the second largest in the world, is based on the process
of E. C. Stanford, who discovered alginic acid in 1883, though
today modern methods are used. For raw materials it has turned
to the old kelping shores of the Hebrides and Northern Isles. On
the island it has a factory at Keose on Loch Eriisort, a site chosen
for the easy access afforded to puffers; the factory receives the
weed, dries, mills and bags it, and the boats then carry 200-ton
loads to Girvan. The factory itself involved some £30,000 of
[433] capital layout and has a capacity of 120 wet tons per week—4
wet tons producing 1 dry milled ton. About a dozen Harris and
[137] Lewis crofters gather the seaweed crop, the most useful type being
bladderwrack or rockweed (*ascophyllum nodosum*). From the
[493] shores at Loch Eriisort, East Loch Roag and Bernera in Lewis,
Husinish and Scarp in Harris, and Loch Seaforth. Where there is
road access the weed is cut by sickle and loaded into a lorry, but
more often it is cut at low water to be floated with the incoming
tide and rafted to Keose, hauled by motor boat.

• 247 A product of the land not readily associated with the Hebrides
is bulbs. Bulb-growing deserves a mention, however, if only be-
[803] cause the experiment to see whether it could become a commer-
cial possibility in Lewis was carried out by the children of Lionel
(Ness) Junior Secondary School. The MacAulay (Rhodesia) Trust
made an investment of £150 to cover initial expenses, and success
followed. When the original project was completed it was ex-
tended, sales bringing the school a useful sum. But an attack of
disease brought production to a standstill in 1966.

312 Another small industry is the aerated-water plant at Ness,
which is operating with reasonable success, and could do better if
228 imports of aerated waters from abroad were reduced. A number
of recent surveys made in the island have found great interest in
such activities as shell-fish processing in Harris to produce semi-
286 preserves, using mostly cockles and mussels. Local knitting already
has a name for its products and a potential for extension on a
commercial scale; this latter began in late 1966. Some forty years
* [193] ago knitting specialists went to Lewis to investigate the possibilities

A street which leaves the main road and cuts into the moor, or common grazing land, is called Grinnbhat, from the name of a nearby loch.

511 The presence of a large Harris Tweed mill in
[348] Shawbost has contributed to a high standard of living
[288] within the village. It is estimated that only 25% of
[493] the households of rural Lewis have cars; about 50% of the households in Shawbost possess them. In 1970
[342] Shawbost had only one occupied tigh dubh, or "black house" built of dry stone and roofed with thatch, which to many islanders symbolizes a past life of poverty and
[404] adverse times. Modern appliances such as refrigerators,
• [251] deep freezers and electric toasters are common in
[207] Shawbost. Most homes also have television sets, and
[206] many have telephones.

288 The mill in Shawbost employs between 60 and 70
463 persons to dye, card and spin yarn, to prepare the yarn in warps which are then delivered to weavers who work in their own homes, and to darn, wash and market the

For example,
a Widow Catherine lost "one red
175 mare and foal (L10), one dun cow (L3/10), and one dun
427 heifer (L1/10)." One family is said to have paid rent
[435] by being fiddlers for "the castle" (the home of Sir
[551] James Matheson), thus earning the patronymic, "Fiddler." Their income stopped abruptly when the fiddler at the time, a great-grandfather of descendants now living, converted to the Free Church and smashed his instrument.

In 1899 and in 1905 it was noted in the rent ledger that two crofters wanted "first chance of a vacant croft in the township." In the first quarter of the century,
[628] a conflict ensued between Shawbost and a neighboring
[764] township over the extension of a cemetery; land was too precious to take out of cultivation and give to the dead of another village.

173 A 65-year-old man recalls, "Men got their living
241 from the land and sea. They kept more cattle when I was
[233] young. They used the dung of the cattle to fertilize the
[237] soil. The entire croft was used. My father's croft was only 2½ acres, but he worked it well and harvested eight stacks of barley to see us through the year." There were
173 a number of kilns to dry grain, and mills along the streams
243 to grind the barley. The "old Norse mill" which was
256 recently rebuilt by the school children as a school project
• [251] was in operation from 1920-1934. "Then the tweeds got

621 A 60-year-old woman remembers that it was a
571 common practice, when she was young, for children from
476 large families to live for as long as six weeks with other families who were relatively better off. They would help harvest the hay or the potatoes or bring in the peat in return for food, lodging and perhaps some clothing. "They usually ate better than they did at home." The children were not necessarily relatives of the families with whom they boarded.

621 Strong friendship, that is, the kind of friendship
572 associated with mobile urban life in which persons confide in each other and share secrets and build up an individual relationship based on extensive knowledge
[602] of one another, was nonexistent. A "friend" was a relative, or someone who gave aid when it was needed.

621 Today it is sometimes said, "It used to be that
178 your relatives were your best friends; now your best
572 friends are better than your relatives." An old man
181 will meet another on the road and say, "I used to see
[602] more of you when you needed me." Neighbors used to
[231] share sheep that were killed; now households kill and
[251] consume their own sheep, and freeze the meat which they cannot use immediately. Groups that walked out together
[464] to the peat to finish the job in a single day are being replaced by individual family units that can motor out
000 and do the job in stages. People prefer to give money

175 During a huge snow-fall that occurred on
261 Lewis in the 1950's, the mobile grocery vans and other
[132] supply vehicles could not come out to the west side,
[443] and a group of men had to make an expedition into town for provisions, after which many families made certain that they always had a good supply of meal, salted
[404] mackerel and herring. Many villagers have gotten deep
[365] freezers to store beef and mutton; others say they do not trust the freezers, that a failure in electricity--which occasionally happens in this region of gales and far-away repairmen--would bring disaster if they depended
458 fully on them for keeping their meat. When the tweed
226 industry is going through one of its periodic depressions, more men go out more often to fish. "I've been going out every night for the last week or so. I don't have a tweed, and I won't have one for the next six weeks. I don't know what I'm going to do; maybe I'll go back to sea. Three of us caught one hundred mackerel last
[251] night. I salted my share, and didn't give any of them away. These are the hard times. We're going to need them during the next six weeks."

233 A few people raise beef cattle, depending largely
[654] on subsidies for encouragement to do so. A few are
[234] beginning to keep cows again for milk, giving as their
[485] reasons that freight charges make the bottled milk too
[434]
[648]

000 return to their own homes at night. There is now less
796 need for the generalized hospitality of the past, which
794 was given to anyone who came to the door looking for fo
829 and shelter. Through these visits some families in
571 different villages have, however, established relation-
574 ships which are kept up by exchanging hospitality at
times of Communion and also in other ways. A family in
[262] Ness may send to a friendly family in Shawbost some gug
[251] goslings of solan geese which are captured by Nessmen
on the island of Rona once a year and are salted to mak
a delicacy that is in great demand. Through such conta
a family wanting to purchase a cow may receive word of
that is being offered for sale in the village of a
Communion contact.

796 Services of Communion last five days. All service
except that held on Sunday evening are intended for the
communicants or full members of the church, also called
[535] "the believers" and "good livers." During this time, n
[485] dances are held in Shawbost, and in Carloway the hotel
closed.

796 On Communion Sunday, the upper balcony of the chur
794 is filled with villagers watching to see if any of the
829 recently converted have decided and have been allowed t
take Communion. Because the villagers watch very close
the behavior of everyone else within the village, any c

later times the landlord might supply timber. Long ago a main source of timber was the shore. The length of the house may be fifty to sixty feet, and the inside breadth ten to twelve feet, spanned by ten or a dozen pairs of couples on which are laid transverse 'cabers', which may be tree trunks, branches, odd wood, old oars, or, exceptionally, sawn timber. The tops of the walls are finished with turf, to keep the filling from being washed out, and to provide a smooth bearing for the couples, the ends of which are pushed into the turf so as to bear on the inner half of the wall; the rounded form and absence of overhanging eaves prevent a gale obtaining purchase on the roof, but a gable with chimney is now usual on the end wall of the inner room. The rafters are annually covered with turf, and the roof is thatched with thin, short barley straw, which was pulled up, not cut, after the ears were picked off, the roots gripping well, and the stem hanging outward and down.

The door gives direct access to the byre (*bathach*), through which one reaches the middle part, or living-room, 'at the fire' (*aig an teine*), from which there opens the inmost part, the 'room' with bed-closets. There is no ceiling to the primitive house, the row of box beds having tops to keep off the drips of rain water. In the middle of the earthen, sanded floor of the living-room is the circular hearth, built of stones with clay between, and raised a few inches, with no chimney.

In the byre, the manure accumulates from spring to spring, and a breach is made in the end of the house for the annual removal of the manure. There are no privies. Where there is fodder and straw in any quantity a barn is added. Stacks are rare because of wind. A low wall, continuous with the house and barn, may enclose the kale-

Lewis and Harris

CH. IX ECONOMIC CHANGES: 1750–1919

175 From the Napoleonic Wars to 1914 the amount of
278 herring cured on the West Coast of Scotland rose and fell.
251 In 1810–14 the East Coast cure was half the West Coast
458 cure, but the peace of 1815 brought the capture of the
Continental markets and the East Coast herring export
leapt up. It averaged 500,000 barrels from 1850 to 1870,
a million from 1880 to 1900, and one to two million barrels
[439] until 1914. With the decline in the export to the Planta-
tions, the West Coast export fell, to rise by 1890 and reach
a peak from 1900 to 1914. Thus, although no more than
from a tenth to a fifth of the East Coast yield, that of the
West Coast had risen greatly.[1] Of this, the Stornoway
cure formed the major part.

175 The chief early type of catch, of white fish (cod, ling
228 and hake), was developed too, and swelled to a peak by
1900, then dwindled and fell. The average Stornoway
District catch of white fish for a dozen years to 1900 was
valued at over £100,000, much of it caught by local boats,
and some of it cured at small 'creeks' (*e.g.* on the west of
the Island, on Loch Roag, notably at Carloway). The
cure, a strong coarse food, was shipped to Ireland and the
Clyde; but after 1900, fresh trawled fish replaced the
cured. From £100,000 before 1900 the value fell to little
over £10,000 in 1912–13, £1000 in 1920, and half that in
1921—½ per cent of the value in 1900!

[471] Thus the herring fishing became the most important
[452] to the Islanders, at first by employment on East Coast boats.
[652] Later they purchased boats and gear for themselves, helped
principally by advances from Island and East Coast curers,
though also by State loans.

[1] *Fishery Board for Scotland*, Table 25 (1938), and Table 23: 6000 barrels in 1790–95; 80,000 in 1870–75; 100,000 in 1912, and 160,000 in 1913. For fair comparison with Table 25, about 25 per cent should be added to quantities, as explained in the notes to the Tables, on the 'seastick', and final reduced, or 'bungpacked', state of barrelled herring (listed in Table 23).

4: Moisley et al. K-5 (1959) 1962 ES10 Highland Scots ES10
Uig

The minister
was cultivating potatoes and his family were eating them
175 as an example to the crofters who were still reluctant to adopt the new crop. Some 70
247 boats were fishing; this was mainly in Loch Roag for they were small open boats greatly
228 outnumbered in good herring seasons by boats from other parts of the kingdom. To
encourage curing, particularly of white fish, the proprietor had set up two storehouses
251 to supply salt; he, or his agents, were probably the only buyers - indeed John Knox, who
441 visited Lewis about 1786, tells us that the estate factor held a monopoly for trading in
[614] cattle, dried fish and other products. The absolute power of the clan chieftain seems
to have survived in Lewis until impending bankruptcy forced the sale of the estate in 1844.
But it was kelp, more than fishing, that helped to support the people of Uig in the late
eighteenth and early nineteenth centuries. Lewis made little kelp compared with the
133 Uists, but the Loch Roag kelp was of particularly good quality and commanded more than
[221] the average price. Further, many people from Uig migrated seasonally to make kelp in
Harris and Uist. Thus even at this time, the intrinsic resources of the parish appear
233 to have been inadequate to support the population. In this connection it is worth noting
143 the change in the average stock held by each family since 1792 as shown in table 3.
[178]

Clearance and Congestion.

175 Even after the end of the tremendous boom in kelp, brought about throughout the
228 Hebrides by the Napoleonic wars, some production continued in Uig. In 1825, when the
land rent of the old parish was £1,862, the proceeds of kelp, after deducting expenses,
175 yielded £1,010 to the proprietor. Thereafter it failed. Meanwhile Seaforth was attempt-
233 ing industrial developments and agricultural improvements. The former included short-
lived distilleries in Stornoway, the latter involved the removal of some small tenants in
166 order to introduce mainland farmers. For these Uig was particularly attractive, the
extensive mountain pasture offering good prospects for sheep graziers. The exact dates
427 of the formation of the earliest farms are not remembered nor are they precisely recorded,
but at least as early as 1826 Alexander Macrae of Kintail had the tack of Scalicro, with
[279] the extensive grazings (now partly occupied by Bernera summer pasture) east of Little
Loch Roag. About 1823 the small tenants of Mealasta and Breanish were deprived of
Mealasta Island, which suggests that a sheep farmer was already installed in that
district. About 1838 all the small tenants were cleared out of Mealasta, six families
being put into Breanish; the remainder are said to have been sent to America.

In Bernera Island, Kirkibost was cleared about 1822, having been lotted in individual
175 crofts some years earlier. Thereafter Kirkibost formed part of the large farm of
427 Linshader. Little Bernera, too, formed part of this farm. On the mainland, opposite
Bernera, small tenants were cleared from the shores of Loch Roag (e.g. Stromo and
Drovernish) in the early nineteenth century, and a tacksman was installed at west
Karshader. Further east the small tenantry were cleared from Ceanhulavaig and
Linshader.

175 By 1844 the kelp shores were almost valueless to the proprietor (though seaweed as
fertiliser remained a vital necessity to the small cultivators, often working the same
land year after year). In 1841 the Chamberlain of the Lews suggested to the Select
Committee on Emigration that some 4,000 persons should emigrate because the land was
inadequate to support them. In 1844, of necessity, Seaforth sold the island. The
[162] population of Lewis was then 17,000 (Uig 3,316); little did the Chamberlain imagine that
in the following ten years it would increase by 16%, and that by the turn of the century
would reach almost 30,000, (Uig 4,462 Figure 8).[1]

585 bridesmaid(s). The house was filled each night with
[43] visitors bringing new gifts or coming to see the latest
additions. Enough presents were given during this
[203] time to set up a household. Invitations to the wedding
were issued verbally, by persons going around to each
[602] house. Anyone could come to the church ceremony, which
was relatively informal and jovial, but only the
"closest" relatives were invited to the sumptuous wedding
dinner which followed the service: the bride and groom,
their parents, aunts and uncles, first cousins and
usually second cousins. Many more were invited to the
wedding supper which started after the dinner, at about
10:00 p.m., and continued throughout the night.

Three main nights were distinguished, although
585 preparations and festivities might go on for weeks. The
252 first night was the night before the wedding, when women
of the village brought hundreds of chickens, which they
plucked and cooked. Meat, usually mutton, was also cooked
and sliced. Butter was rolled into balls. Neighbors
brought milk and other provisions and assisted in the
baking for a week beforehand.

585 On the second night, hundreds of villagers ate the
[535] chickens and mutton prepared for the wedding supper,
[533] and danced to the music of a piper or other musicians.
[273] Many young boys had their first taste of beer or whiskey
on these occasions.

256

256 CEREAL INDUSTRY--industrialized processing of cereal products (e.g., flour, starch, breakfast foods); storage facilities (e.g., grain elevators); mills and bakeries; technology and special equipment; organization of labor and production; etc. See also:

For example, 46
a Widow Catherine lost "one red
195 mare and foal (L10), one dun cow (L3/10), and one dun
427 heifer (L1/10)." One family is said to have paid rent
195 by being fiddlers for "the castle" (the home of Sir
551 James Matheson), thus earning the patronymic, "Fiddler."
Their income stopped abruptly when the fiddler at the
time, a great-grandfather of descendants now living,
converted to the Free Church and smashed his instrument.

In 1899 and in 1905 it was noted in the rent ledger
that two crofters wanted "first chance of a vacant croft
628 in the township." In the first quarter of the century,
764 a conflict ensued between Shawbost and a neighboring
township over the extension of a cemetery; land was too
precious to take out of cultivation and give to the dead
of another village.

193 A 65-year-old man recalls, "Men got their living
241 from the land and sea. They kept more cattle when I was
223 young. They used the dung of the cattle to fertilize the
229 soil. The entire croft was used. My father's croft was
only 2½ acres, but he worked it well and harvested eight
stacks of barley to see us through the year." There were
193 a number of kilns to dry grain, and mills along the streams
243 to grind the barley. The "old Norse mill" which was
251 recently rebuilt by the school children as a school project
897 was in operation from 1920-1934. "Then the tweeds got

193 "Then the tweeds got 47
243 going and the barley took too much trouble; so they had
251 no use for the mill."

193 A 60-year-old woman remembers, "They depended on the
262 potato and fished a lot. I was raised on oatcakes, barley
bannocks, and salt herring. There were no vans and no
school canteens when I was young; you had to carry your
264 own 'piece' to school. We had porridge with fresh milk
for breakfast, oatcakes and butter for lunch. Dinner was
at 4:00, of potatoes and fish and milk. We had meat maybe
251 once a week. My father poached a lot. We ate the heads
and the roe of the salmon fresh, and salted the rest."
Once among the cleanest, Hebridean teeth now vie with
164 British cities in extent of decay. It is not uncommon for
759 a child in his first year of school to have six teeth
pulled by the travelling dentist.

261 Various customs associated with food which exist today
262 reflect the days when fare was meager. Tea-drinking is
171 omnipresent in Britain, but in the islands it has
272 special significance. The taking of tea constitutes
574 the denouement of a visit, and almost always occurs when
someone steps over someone else's threshold. To refuse
576 tea has some of the connotations of an insult; and to
take only tea, without food, is to have a copan falamh
(empty cup).

133 The 1,700 acres of common pasture stretch to the east and west of the crofts, across
231 peninsula which terminates in Gallan Head, extending to Ness of Crowlista and Valtos
in the south. The whole coast is broken and rocky, the land inland is peaty, and Aird
65 lacks the advantages of the machair land found further west. To the north of the village
there is now an R.A.F. radar station on Rudha Cast, built on what was part of the common
pasture. It dominates the landscape and makes a considerable difference to the life of the
inhabitants.

34 The township, though isolated, is reached by a good road which leaves the main road
497 at the western end of Glen Valtos. Grocery vans call on Wednesday and Friday, a
193 butcher's van on Saturday, and the local people are also allowed to shop at the N.A.A.F.I.
within the Camp. The road through the village approximately follows the line of the 100
585 ft. contour and all the houses are built directly on to the road, with byres, weaving sheds
540 and other buildings behind, whilst in most cases bens are kept on the steeper slopes below
the road. Thus the settlement has far more of the appearance of an English village than
359 have most crofting townships, but there is no shop or post office. The majority of the
317 houses are stone with slate roofs and fairly large, though some of them have been built for
more than fifty years. All have electric light and their own water supply and several have
modern byres.

427 There are ten crofts, as the enlargement of one of the original nine was subsequently
311 split off to make a separate croft. Of these, one tenant is an absentee and another an
499 elderly woman who does no cultivation. In both these cases, grazing is let to others so
that there are actually eight operative units. The crofts are fenced in their upper portions,
but in most cases the fencing does not extend down to the river and there is free access to
the single concrete footbridge which spans the stream.

241 The only crops now grown are oats and potatoes and a few vegetables, with some sown
grass; natural grass provides most of the hay crop. Lime and shell sand and artificial
fertilisers are used; the two former particularly on the ground near the river where the
cultivation is in narrow strips separated by drainage ditches and ploughing is done by horse.
407 Most of the cultivated land is on the gentler slopes behind the houses, where the use of a
412 tractor is possible. Before 1914 most of the land within the original turf dyke was culti-
824 vated; bere was grown and ground at the mill for meal for barley bread. Seaweed was
extensively used as a fertiliser and most of the families kept eight or nine cows, so that
223 there was a more plentiful supply of manure. Now, six of the families each keep one cow
for domestic milk supply (two of the others each keep a goat). The township possesses
no bull, but make use of those at Valtos or Ardroil.

253 On the other hand, the sheep soum is generally exceeded; instead of the entitlement
of about 200, the total flocks grazed on the township pastures are approximately 500. The
lambs are weaned early in August and put on Rudha Caol (Air Force use has not prevented
this) and wedders are usually sold at the age of two or three years in Stornoway - many
in October to reduce the numbers that must be pastured during the winter.

162 The total resident population of Aird consists of fifteen males and sixteen females.
Of these, twelve are over 65, six are aged 45 - 64, 11 are in the 15 - 44 age-group (there
are only three married couples) and there are two children under 15. Nevertheless, most
of them are complete families; only one person lives alone; no members are reported as
146 periodically working away, no men and only two women are permanently away. Neither
has there been much emigration since 1939 - five women only have married out of the
parish. The tenants of seven of the crofts are over the age of 65, the only one in the 15 -
44 age-group is a new-comer to the district and does little croft work.

[Kersh=der]

284 with heather and peat on the higher areas, hay is taken off 19.25 acres. Four acres, mainly for
511 potatoes, are worked by spade but most of the cultivation is by tractor hired from Balallan or,
409 in 1958, from Habost. Lazybeds are common and in some cases are carefully renewed, but
the present tendency, reaching its extreme in a field of about two acres on one croft, is towards
the formation of larger, ploughable fields for ease of tractor operation. Most cultivation is in
206 zones (a) and (b), with little development of (c) at present. The only crops are oats and potatoes,
244 with some garden plots of cabbages, turnips and carrots. The potato main crop is generally
Kerr's Pink (Golden Wonder on one croft), with a couple of rows of Skerry Blue or Edzell Blue
199 for earlier. There is no memory of Black Oats (Avena strigosa), and bere (Hordeum vulgare)
has certainly not been grown since 1930, and probably not since 1909. The oats are grown
206 exclusively for winter feed and are hand-threshed with stock and comb as the need arises; the
258 last water mill in the locality went out of use after 1914; the last handmill in 1916; no grain
has been sent to Stornoway since about 1930. Rotations are extremely irregular: some lazy-
beds are still cultivated with alternate crops of oats and potatoes and have heavy seaweed and
manure fertilisation, but most other arable areas have some sort of oats, potatoes, oats, sown
226 grass sequence. Fertilisers used are seaweed and manure (ten crofts), manure (eleven crofts), shell
250 sand (one croft), lime (ten crofts) and artificials - 'Potato manure' and sulphate of ammonia -
247 on eight crofts. Artificial fertilisers and much of the seed are obtained through the Crofters'
Agency.

251. The only two horses ever owned by this township were kept on croft 11 from 1936 to 1953. The
409 plough was first introduced in 1936. When a tractor from Balallan became available for hiring
252 in 1953, the horses were disposed of. The present soums are by cow, young beast and sheep
per croft in proportion to rents and range from 3 cows, 3 young beasts, 49 sheep down to 1 cow,
1 young beast and 23 sheep. Eight crofts exceed their entitlement but no croft hasless than half the
soumming and the deficiency is mainly in cattle, especially young beasts. On the other hand, no
254 operative unit is entirely without cattle as manure is extremely important. Cattle are kept for
257 domestic milk supply, and calves, having qualified for subsidy, are normally sold at 6 to 8 months.
10 acres of the common grazing were re-seeded in 1957 and the following rhythm for milk cows
231 is developing:-

251
255 (a) As soon as the weather allows in May, the cows are put out in the park for about three
511 weeks.

(b) Next, about 6 weeks are spent on the common grazing between the ring fence and the new outer fence erected in 1957.

(c) Back to the re-seeded park for about five weeks.

(d) Return to the crofts for the winter, being let out either to the park or to the common grazings whenever the weather is suitable.

The young beasts spend much of their time on the outer common grazings. As most of the crofts,
beginning with one in 1938 and ending in sequence with 10, 11 and 12 probably in 1959, are fenced,
the old arrangements for township commoning from 15th October to 10th May are now obsolescent.
Another park was also fenced for general purposes and for weaning in 1957. Prices for calves
and cattle are very low and this discourages cattle breeding; on the other hand, lack of winter
keep enforces an occasional sale.

The rhythm of sheep husbandry is largely independent of that of cattle:-

(a) By 20th November all sheep, except possibly the lambs, are cleared from the crofts for the tupping of breeding ewes thereon till 31st December. Every crofter now keeps his own ram, exchanging it or buying another at least once in five years.

342 yard and occasionally a barley-kiln in which to dry grain
343 before malting it for home-brewed beer. A 'black mill',
351 with its primitive horizontal water-wheel, stands apart by
[251] some burnside.
[273] Round the circular hearth, a large company can assemble in very social fashion for talk, story and song, the meeting
354 *together* (*ceilidh*). By the transfer of the hearth from the
571 centre and the substitution of a gable fireplace and regular
538 chimney, the social circle is halved, while meantime the
[178] tales of the *ceilidh* are forbidden or forgotten. Happily the bench still stands against the wall, near to the open
[353] door, through which neighbours slip in with a word of greeting to find a customary welcome.

342 The dwellings on the summer pastures out on the moors show great variety, illustrated in Fig. 10(B). A simple
361 type in use is built of turf and stones, lightly roofed with
[178] turf placed on spars. A more primitive 'beehive' type (which fell out of use before 1900) was stone-built and
[171] corbelled, probably for lack of timber. And whereas the lighter type always stands by itself, the corbelled type was added to until a dozen cells formed a single mass, suggestive of ancient 'neolithic' hamlets as at Skara Brae in Orkney, described by Childe, and of the domed, corbelled huts of the ancient East.

[343] A further type was the 'spring house' of Tolsta, NE. Lewis, in which both cattle and folk sheltered in spring a little way from the village, before going out to the more
[124] distant moor. Mr. Donald Macdonald, F.R.S.G.S., a native of Tolsta, informs me that the spring house was in
[178] use until 1936. He remembers vividly how life in the shieling restored health and colour after the winter.

CHAPTER IX

ECONOMIC CHANGES: 1750–1919

(A) TRANSITION: MIGRATION, FISHING AND KELP-MAKING

175 433 [621] [427] [794] [437] UNTIL the 'Forty-five the township had lived an almost self-contained life. Its traditional economy was self-sufficient except for two indispensable commodities—salt for the housewife and iron for the smith. Beyond this, the chief demand for payment was the rent to the lord, with tithes for the kirk. For these needs and demands a step towards production for exchange was required, the more so that what was exported might include the very necessities of life in 'bad years'. The rent was paid largely by the sale of a surplus steer or two, and 175 317 436 [435] drovers called for the cattle. By 1790, if not before, two or three open boats set out annually from Uig, for instance, for Glasgow, laden with salt beef and dried salt fish. Although salt seems of little account today, it once bulked large in the Budget, its price being heightened by duty, especially after 1707: "as dear as salt", was a saying, *cho daor ris an t-salluinn.* [251] Salt was needed to preserve the carcase of a 'cattle-beast' or sheep killed in autumn, and 175 433 [326] [443] for cod and herring curing. Wrecks were valuable, as on all infertile undeveloped coastlands, both for their timber and their iron. Cairds or tinkers occasionally brought metal goods; or a packman called, as strange a figure then

173 243 257 829 "Then the tweeds got going and the barley took too much trouble; so they had no use for the mill."

173 262 A 60-year-old woman remembers, "They depended on the potato and fished a lot. I was raised on oatcakes, barley bannocks, and salt herring. There were no vans and no school canteens when I was young; you had to carry your own 'piece' to school. We had porridge with fresh milk [264] for breakfast, oatcakes and butter for lunch. Dinner was at 4:00, of potatoes and fish and milk. We had meat maybe once a week. My father poached a lot. We ate the heads [251] and the roe of the salmon fresh, and salted the rest." Once among the cleanest, Hebridean teeth now vie with 164 759 British cities in extent of decay. It is not uncommon for a child in his first year of school to have six teeth pulled by the travelling dentist.

261 272 Various customs associated with food which exist today reflect the days when fare was meager. Tea-drinking is [171] omnipresent in Britain, but in the islands it has 272 574 special significance. The taking of tea constitutes the denouement of a visit, and almost always occurs when [576] someone steps over someone else's threshold. To refuse tea has some of the connotations of an insult; and to take only tea, without food, is to have a <u>copan falamh</u> (empty cup).

175 261 [132] [443] During a huge snow-fall that occurred on Lewis in the 1950's, the mobile grocery vans and other supply vehicles could not come out to the west side, and a group of men had to make an expedition into town for provisions, after which many families made certain that they always had a good supply of meal, salted [404] mackerel and herring. Many villagers have gotten deep [365] freezers to store beef and mutton; others say they do not trust the freezers, that a failure in electricity--which occasionally happens in this region of gales and far-away repairmen--would bring disaster if they depended 458 226 fully on them for keeping their meat. When the tweed industry is going through one of its periodic depressions, more men go out more often to fish. "I've been going out every night for the last week or so. I don't have a tweed, and I won't have one for the next six weeks. I don't know what I'm going to do; maybe I'll go back to sea. Three of us caught one hundred mackerel last [251] night. I salted my share, and didn't give any of them away. These are the hard times. We're going to need them during the next six weeks."

233 [654] A few people raise beef cattle, depending largely on subsidies for encouragement to do so. A few are [234] beginning to keep cows again for milk, giving as their [435] reasons that freight charges make the bottled milk too [434] [648]

262

262 DIET--staple and other foods consumed; seasonal changes in diet; proportion of various foods in diet; group differences in diet (e.g., by age, sex, social class); discriminations between edible and harmful foods; food preferences and avoidances; food taboos; etc. See also:

Food processing	25	Religious taboos	784

000 in the far north. "There were two fishing seasons.
175 For one season you went to Fraserburgh, Stronsay,
228 Lerwick and Peterhead; and then the winter fishing was
[221] in England, at Yarmouth, Scarborough and Loucester.
I remember in Yarmouth we didn't like the English
• [262] bread, it was such a dull color. We liked the pure
white Scotch bread."

They lived in small huts, and the work was hard but
full of fun. Neighborhood girls used to go together,
bringing bedding and different items in large chests to
share in the housekeeping. Three girls worked together
in a crew, and there were as many as six sharing a room,
in double bunks. Some of the huts were so small that
there was barely enough room for the beds and the cup-
boards. At night the boys would come in off the boats.
"You were so tired from being up since early morning;
[579] but you were always able to dance. You were treated with
[178] respect; the youngsters today aren't so good." The
women who married non-islanders that they met at the
fishing were not likely to return.

175 When the weaving started on a large scale, the girls
288 "were glad enough to have work at home, even though the
464 work was hard." But many continued their temporary
175 absences from the island, working in hotels or as
464
162
357

173 "Then the tweeds got
243 going and the barley took too much trouble; so they had
257
829 no use for the mill."

173 A 60-year-old woman remembers, "They depended on the
• 262 potato and fished a lot. I was raised on oatcakes, barley
bannocks, and salt herring. There were no vans and no
school canteens when I was young; you had to carry your
[264] own 'piece' to school. We had porridge with fresh milk
for breakfast, oatcakes and butter for lunch. Dinner was
at 4:00, of potatoes and fish and milk. We had meat maybe
[251] once a week. My father poached a lot. We ate the heads
and the roe of the salmon fresh, and salted the rest."
Once among the cleanest, Hebridean teeth now vie with
164 British cities in extent of decay. It is not uncommon for
759 a child in his first year of school to have six teeth
pulled by the travelling dentist.

261 Various customs associated with food which exist today
292 reflect the days when fare was meager. Tea-drinking is
[171] omnipresent in Britain, but in the islands it has
292 special significance. The taking of tea constitutes
574 the denouement of a visit, and almost always occurs when
someone steps over someone else's threshold. To refuse
[576] tea has some of the connotations of an insult; and to
take only tea, without food, is to have a copan falamh
(empty cup).

264 The only occasions on which it is customary to feed
574 someone an entire meal is at a work party, such as peat-
576 cutting. On such occasions the preparation of meals is
[461] done in an atmosphere of competition and mutual scrutiny,
[476] and the meals are often elaborate. At other times, the
requirements of etiquette can be minimally fulfilled by
giving foods which are still relatively abundant, but
which were much more abundant when the land was cultivated
• [262] and cows kept. Such foods are barley bread, oatcakes,
264 clotted sour milk, cream and fresh butter. These foods
571 are usually offered to visitors along with tea, and in the
574 past this custom served to minimize the economic disparities
between villagers, to spread scarce resources. A similar
[737] function was served by the practice of giving part of
[431] each catch of fish to old widows and other villagers in
need of aid. Even though food is more abundant and diverse
today, the taking of tea, and especially food, during a
visit is still very important.

173 A 50-year-old man who "married into" a croft recalls,
[581] "I came from a family of ten children. Everyone had to
[428] leave, or marry a girl with a croft. Only the eldest son
could inherit the croft." There was little room for
423 romanticism in the fight for scarce land among the sons
581 of large crofter and non-crofter families. "The most

512 The cattle
233 knew their own sheilings; sometimes
825 they came back before milking time and stuck their heads
[234] inside. They stood outside the sheiling at night, and
that's how you can tell where a sheiling once was, even
though the walls have fallen, by the rich green grass.
Calves were born during the summer. A hollow was scooped
233 out in the peat, and lined with turf and moss. People
[422] had as many as four or five cows. It was like Switzerland
[292] only we didn't have the bells on the cows. There was lots
• [262] of milk, fresh thick cream and crowdie (clotted sour
[234] milk); the old people knew how to make cheese.

233 "The moor was very eerie at night, with the sound of
721 the birds. There were only a few hours of darkness
751 anyway, and I'm sure we didn't get much sleep, but somehow
[513] we were always fresh. It was the air, the moor air is
more health-giving. The air is different there. Ill
people benefited from the change. Sometimes a person
with TB would stay out there all summer. The air is heavy
by the sea.

805 "There was no sense of time the way there is today.
233 If you got lost in the snow or fog, you followed the cows
221 home. You had all summer to take home the peats, to work
829 the croft, to harvest the corn. There wasn't a world,
[178] there was only ourselves. That has changed since the war.

2 ECOLOGY AND PHYSICAL ENVIRONMENT

THE population of the island huddles round the coastline on a central hearth. This is mainly because the island parts of the island are either barren, as in Harris, or infertile bog, as in Lewis. Much of the south Hebrides has, on the west coast, the extremely fertile machair land, but Harris and Lewis do not have these useful patches. The machairland is land built up shell sand (and hence of vital fertilizer importance); it is a fertile fringe, no more than a belt of varying width between the sea and the acid peat bog on the inland side. Where this land does not exist, mainly on the west coast of the island, townships crowd round it for the good growing it can give. The other reason for the attraction of the coast is the obvious one: the close proximity, on the doorstep, of a change of diet, shellfish and inshore fish such as whiting, cod, haddock and mackerel. The exceptions to this coastal grouping are Achmore, Claasro, and Lochgarioch in Lewis.

There is a great phytogeographical difference between the east and west coasts of the island, this apart from the incidence of machairland on the west coast. The eastern side is steeper to the sea; though there offer cover at Gallan Head, Port Nis and Ranga. The south-western coastline has high, almost sheer cliffs with few inlets or sheltered harbourages excepting Loch Roag, a magnificent inlet, sheltered as its farthest inland penetration by Great Bernera. The coast on this island side often presents rocky teeth to the Atlantic's buffeting, and often suddenly falls down to sea level to display wide stretches of sand. Uig Bay, where the Red River runs into the sea, is a breath-taking sweep of whiteness. The eastern coast is generally rocky but has more inlets, lochs which carry township mainly engaged in fishing and tweed manufacture.

THE PEOPLE

198 262 Most of the outward changes which have occurred in the island took place in the two decades just after the first world war. Food, for instance, now tends to be better balanced and contains more nutrients. Staple diet in the past were mostly confined to a few oatmeal and bread on the potato. Fish, particularly those with essential oils (cod liver), of course, available; but only if the fishermen were lucky in the catch. As for vegetables and fresh fruit, it was not until after the 1920s that these became generally available all the year round.

Another outward change has been in dress. Until the beginning of the twenties, the women wore a black petticoat striped with colours, a dark blouse, often with stays, and a knitted muffler round the neck and over the head. In summer, the tartan shawl was more usual. Men wore tweed fitted at weekdays. Much attention tended to be of the homespun type, rich in water-resisting oil. Later these were replaced, as far as the fishermen were concerned, with oilskins, waterproof and rubber boots. Even nowadays of course tends to conform to what is displayed in magazines, on the film screen and on television.

The changes in the mental characteristics of a people are not so obvious. Centuries of generations of long-dead forbears have contributed their share to the character of the island people today. It is a complex one. Impressions of the island people as they appear to the outsider, one never looked for those complex aspects which gave the society its *raison d'être*. That islandfolk of former times were fond of music and dancing was the observation of the Rev. John Lane Buchanan, who was Missionary Minister to the Isles from the Church of Scotland' from 1782 to 1790. In a volume published in 1793, in which he describes his Hebridean experiences, he says that the British laws had been introduced to the Island of Lewis by the Scaforth of that period. 195 196 He says, 'since their late happy change from servitude to freedom, by the present noble-minded proprietor, are animated with such life as to meet in companies, regularly each week, to assemble, where the old and young take their turn in this agreeable past-time (dancing), when they exercise themselves with amazing alertness and spirit.' Martin Martin mentions that in his time (c 1695) the Lewis people were very desirous in the exercises of swimming, archery, vaulting, leaping. He tells also says that they were great lovers of music, and that when he was in the island he heard of eighteen men who could play the violin well without being bred taught.

The Rev William MacRae, minister of Barvas, writing in the *New Statistical Account*, gives a description of his parishioners (in 1836) which can be applied to all the country districts in the island at that time. After stating that in their habits much clean- 195 liness can naturally be expected, considering their poverty and the wretchedness of their habitations, he says:

> These mode of living most closely approaches the pastoral state, and, therefore, manufacture, navigation, or commerce, their whole round of duty consists in securing fuel, in sowing and reaping their scanty crops, and in rearing their flocks, and feeding them at proper times. Yet in these limited concerns, while supplied with food and clothing of the plainest description, and able to pay their rents, which are generally low, cottagers are absolute of happiness and contentment. Blue kelt (a thick cloth) is almost the only dress worn by the men, and ruffle, sometimes, by the women, when they wear dresses of plaiding, all home-made. In many instances, however, cotton shirts and tartan plaid gowns are beginning to supersede the use of some of these articles . . . Their ordinary food consists of oat and barley meal, potatoes and milk variously prepared. They are generally speaking, frugal and moderate beyond conception. The produce of a foreign soil such as tea, coffee, and sugar, and the necessary commodities of art, such as knives, forks, and etc., are to them altogether alien.

It is of interest that the change in dress-types (from woollen homespun to cotton fabrics) was followed by an increase in the incidence of rheumatism.

Today, the island folk are reputed to be gloomy with a black, depressive outlook towards life. The editor of the *Stornoway Gazette* has pointed out: 'We cannot understand a people and why they act as they do unless we know the context of their memories. We cannot understand the place of the naturally gloomy in this agreeable past-time (dancing), when they exercise themselves with amazing alertness and spirit.' Martin Martin mentions that in his time (c 1695) the Lewis people were very desirous in the exercises of swimming, archery, vaulting, 134 or leaping.

THE PEOPLE

195 125 195 126 195 127 195 128 195 129 195 130 195 131 195 132 195 133 195 134 195 135 195 136 195 137 195 138 195 139 195 140 195 141 195 142 195 143 195 144 195 145 195 146 195 147 195 148 195 149 195 150 195 151 195 152 195 153 195 154 195 155 195 156 195 157 195 158 195 159 195 160 195 161 195 162 195 163 195 164 195 165 195 166 195 167 195 168 195 169 195 170 195 171 195 172 195 173 195 174 195 175 195 176

centre of the mud floor through tons and tons of decomposing organic matter or manure.'

The island, for all its ills and chills, had a high birth-rate and a low death-rate. Martin Martin (1695) declared: 'It is a general observation of much as live on the sea coast that they are more 93 more prolific than any other people whatever.' Its extension was opened in 1925, and the hospital was provided with a surgeon and an ambulance. Another extension in 1929 was the result of a gift of £3,000 from Mr John Bain, of Chicago, who was then a Lewis man 93 34 President of no less than fourteen banks in the Mid-West. The Lewis Seaman's Institute was opened in 1930.

Tuberculosis was at one time in the island's history a disease 195 that caused many deaths and much sorrow. About 1930 an Anti- 195 tuberculosis Society was formed, with Dr Robert Allan, of Ardroil, 194 as President. Later, another doctor came to the island and his factor-over from Skye to collect the island goods that were to be sold, and he lived with his white mistress in Stornoway. Both would see 194 them through another twelvemonth. However, as the demand for the island's products declined, communications became more important to keep up support the family; and he leave the Island 194 on the Scottish mainland. Large-scale emigration began in 1852 when thirty-six islanders (with Sutherland) left for America. Island life was penetrated by the outside world of life; boating disasters and cliff-falls in particular deprived the community of the vital male elements needed for survival. In 1863 a survey revealed that 25 per cent of Lewis children were in need of dental treatment. 262 This disease ravaged the island for almost a century and was brought back at the male age. About 1810 the population was about 200, a definite overcrowding. By 1861 it had fallen to 78; 195 in 1911 it was 80, and in 1921, 78. A decade later it was around 1. Isolation tended to make the St Kildas a human menagerie. 194 With the improvement in boat services, St Kilda became a 'must' 194 for tourist parties. The tourist trade was of considerable importance for the population after July 1877, when the *Dunera* *Castle* steamed north and we had a 1300-ton steamship called the *Dunera Castle* steamed north and we had a 1300-ton steamship called the *Dunera Castle* steamed north and we had a 1300-ton steamship called the *Dunera

(4) FAMILY, FARM GROUP AND TOWNSHIP

natural zone, could not be extended. In any case, the relenlusion of clay land tended to slacken as efforts turned to fishing and kelp-making. The introduction or increased growing of potatoes added to the human, but hardly to the animal, food supply. Finally, while the beginnings of dedicated knowledge and vocationism had shifted the growth of population after 1750, veterinary science had made no progress, nor did it advance in the Island for many years to come. We may conclude that an average stock per island family about 1750 was rather more than that of 1790, and the average relatively larger, while both were greater than the average of today, particularly in the Lews.

When then, could a family have to eat, from such crops and stock? While in winter even now there is almost no milk to be had on a croft, and there would be little then, there was salt meat, dried or salted cod (or herring) and fish oil; oat and barley meal and some rye meal; cabbages; and, increasingly in the eighteenth century, potatoes. Martin included potatoes among the crops grown even on far St. Kilda in 1697. A century later it was written that the people of Uig, for instance, had, though "struggling", been induced to grow and eat them "forty years before". The seed had to be sought and tended where changes are slow and memories long! But it was written of Harris that by June the meal and potatoes had mostly been consumed, "and such as cannot afford to purchase imported meal subsist chiefly on the milk of their cows and sheep, with what fish they may chance to catch, till their wants are relieved by the first fruits of their potato crops early in Harvest".

We conclude that with even less money but a little more grain the population in the Island had fluctuated about a mean for some centuries before, as it had in so

quarters without any legal hold on the land. In Duirinish parish, which includes Glendale, only twenty-one families had enough land to meet even subsistence needs.[60] In one Glendale township, Bohistaiste, some crofts of "not an acre had as many as fifteen people to support."[61] Part of this extreme congestion was due to the continued practice of subdividing some croft when a child married. Although the population in 1841 had fallen to 17,600, from 21,000 in 1841, almost every township had two or three times the number of families which had lived in them in 1841.[62]

The loss of the summer shelings and the common grazings which they had enjoyed[63] meant the lions were silent. Since the rent continued to be based on the value of livestock and was wholly or partially paid from the sale of cattle, all extra, which the proprietor didn't sell and, need for food and hospitality. The mills were all but idle. The people had to buy flour, meal, and bread imported from Glasgow. Almost all were heavily in debt to the local merchants who seem to have been unscrupulous with more ambitious with the crofters than were the crofters and cottars. Milk became a previous commodity. Frequently, the old one had only enough for her calf. Unable to keep horses, the women hewed beasts of burden. They carried

[60]Ibid., p. 112.

[62]Smith, op. cit., p. 157; Cumming, op. cit., p. 140; and Report Minister P. 21.

[63]The following is drawn from the evidence presented to the Napier Commission by the crofters and cottars of Skye; see Report Napier, Appendix 1, pp. 1-82.

wealth, rose above the indigent crofters and cottars.

These changes had a pronounced effect on the culture and the population. Economic hardship and evictions prompted emigration, forced many men and women to seek seasonal work away from home, and led to a reduction in the marriage rate. Crofting which had already become part-time crofting now was a spare-time pursuit. The Gaelic Bothan was dependent on money, on the wider economy, for the satisfaction of most of his needs. The croft was providing no more than a few potatoes for the table and some oats for the cattle, the crofter's only export. Still, no landless working force appeared. Purchase had grown and there was a weakness mill, but there does not seem to have been any current movement into the village by the crofters.

While much of what was meaningful to the people was lost, the religious revival, the renascence of the "Gaelic Bothan" became an of intial policy of a new church. The emotional approach of the ministers and the "Men," who were now elders in the church, and the sentimalism of the large outdoor meetings functioned to restore the social disequilibrium. Although the extended family, township, and moiteas family suffered from instability, the people found intelligible roles within the religious sphere of activity. Their religion was reinforcing their way of life. The adherences of much of the old culture was accompanied by a strengthening of many traits which reaffirmed the desirable status values. The culture found a new focus in congregational religion and was able to maintain a continuity while the content changed.

TABLE 2

ESTIMATED VALUE OF AGRICULTURAL PRODUCTION
IN THE ISLE OF SKYE

Produce	Total Production	Local Consumption[a] (Household & Draft)	Exports
	£	£	£
Oats	3,500	3,500	....
Potatoes	23,500	23,500	....
Turnips	2,000	2,000	....
Hay	24,000	24,000	....
Sheep and Lambs	70,000	20,000	50,000
Wool	50,000	10,000	40,000
Cattle	90,000	20,000	70,000
Milk	30,000	30,000	....
Poultry and Eggs	40,000	40,000	....
Pigs	6,000	....	6,000
Miscellaneous	5,000	5,000	....
Totals	£ 344,000	£ 178,000	£ 166,000

[a]Consumption includes an allowance for loss of stock.

mailer. Since agriculture is a poor rule in the best of years, the crofters had to supplement their income in other ways. These changes had a pronounced effect on the culture and the population. Economic hardship and evictions prompted emigration, forced many men and women to seek seasonal work away from home, and led to a reduction in the marriage rate. Crofting which had already become part-time crofting now was a spare-time pursuit. The Bothan was dependent on money, on the wider economy, for the satisfaction of most of his needs. The croft was providing no more than a few potatoes for the table and some oats for the cattle, the crofter's only export. Still, no landless working force appeared. Purchase had grown and there was a woolen mill, but there does not seem to have been any current movement into the village by the crofters.

While much of what was meaningful to the people was lost, the religious revival, the renascence of the "Gaelic Bothan" became an of intial policy of a new church. The emotional approach of the ministers and the "Men," who were now elders in the church, and the sentimalism of the large outdoor meetings functioned to restore the social disequilibrium. Although the extended family, township, and moiteas family suffered from instability, the people found intelligible roles within the religious sphere of activity. Their religion was reinforcing their way of life. The adherences of much of the old culture was accompanied by a strengthening of many traits which reaffirmed the desirable status values. The culture found a new focus in congregational religion and was able to maintain a continuity while the content changed.

Throughout the present century, the commercial importance of deep sea fishing, judged on the basis of income, numbers of crofter-fishermen, and boats, has steadily declined. The number of crofter-fishermen has decreased at a faster rate than the decline in population. In recent years its significance as a part-time chore has also been reduced. Wage labor has replaced fishing in the economic pattern. In 1900 there were 1,015 crofter-fishermen with 485 boats.[22] While the number of fishermen rose to 1,039 in 1905, from then until now their number has fallen steadily. In 1953 there were 237 crofter-fishermen with 120 boats. Despite higher prices, the value of fish landed on the island is one-third that of 1900. In 1952 the total contribution of fishing to the local economy was £30,000. This is in marked contrast to the Outer Hebrides where fishing earnings is more among than crofting.[23] Fish have, of course, remained essential in the diet. All the crofters have their barrel of salt herring, purchased from mainland curers. Their own fish is salted for their use.

All who have considered the "Highland Problem" have stressed the need for some form of secondary employment to support the economy. Fishing has enjoyed great prestige as a recommended industry. This is due to the long tradition and the importance of fishing in the Outer Isles.[24] There are several difficults in the program as far as Skye is concerned.

[22]Thomas Bateson for the Isle of Skye,—1904-1905,"Minutes Relative, Scottish Home Department, Edinburgh, Scotland (in the files of the Division).

[24]Ibid., p. 89-110.

stem. So fish without scales is eaten by the Ulvanas.

The crofters use small boats, under thirty feet keel, and work in pairs. By contributing crew and sharing the risks as well as the profits, the cost of equipment for each individual is modest. Here, of course, is an additional form of cooperation which has not disappeared. The technique here remains conservative. The use of small boats restricts operation to sheltered areas, and conservation is not an important consideration.[25] Some order, for example, issued by the government prohibited the sale of herring lobsters (females with egg) without success. The eggs are simply scrubbed off. The law will be useless as long as there are men among them who continue to believe that: "In the old days we took herring lobsters, and the lobsters thrived." Another reason has made it difficult to enforce more sane issue, the favorite size in the London and Paris markets. This has not only spoiled the market but also is difficult on the crofters because they sell small. Still, the real trouble is said to be the lack of a closed season. Bretons come over and work the waters during the summer when the Fishermen is busy on the land. Crofters from southern Skye are accused of poaching the northern lobs. This leaves few lobsters for the local residents who only on after lobster between November and March.

Although international considerations do not pertain to the question of a closed season, the British government considers

[25]F.T. Darling and Hurley, op. cit., pp. 44-47.

264

"Then the tweedy get
going and the barley took too much trouble; so they had no use for the silk."

A 60-year-old woman remembers, "They depended on the potato and fished a lot. I was raised on oatcakes, barley bannocks, and salt herring. There were no vans and no school canteens when I was young: you had to carry your own 'pieces' to school. We had porridge with fresh milk for breakfast, oatcakes and butter for lunch. Dinner was at 4:00, of potatoes and fish and milk. We had meat maybe once a week. My father grazed a lot. We ate the heads and the roe of the salmon fresh, and salted the rest."

Once among the cleanest, Hebridean teeth now vie with British cities in extent of decay. It is not uncommon for a child in Shawbost in the summer to have six teeth pulled by the travelling dentist.

Various customs associated with food which exist today reflect the days when fare was meager. Tea-drinking is omnipresent in Britain, but in the Islands it has been of special significance. The taking of tea constitutes the denouement of a visit, and almost always occurs when someone steps over someone else's threshold. Refusal to take tea some of the conversations of an hour, and to take only tea, without food, is to have a sonan Falaich (empty cup).

The only occasions on which it is customary to feed someone an entire meal is at a work party, such as peat-cutting. On such occasions the preparation of meals is done in an atmosphere of competition and mutual survival, and the meals are often elaborate. At other times, the requirements of etiquette can be minimally fulfilled by giving foods which are still relatively abundant, but which were much more abundant when the land was cultivated and cows kept. Such foods are barley bread, oatcakes, clotted sour milk, cream and fresh butter. These foods are usually offered to visitors along with tea, and in the past this course served to minimize the economic disparities between villagers, to spread scarce resources. A similar function was served by the practice of giving part of each catch of fish to old widows and other villagers in need of aid. Fish is now more abundant and diverse today, the taking of tea, and especially food, during a visit is still very important.

A 50-year-old man who "married into" a croft recalls, "I came from a family of ten children. Everyone had to leave, or marry and get with a croft. Only the eldest son could inherit the croft." There was little room for romanticism in the fight for scarce land among the sons of large crofter and non-crofter families. "The most

Keepint the sea-
136 weeds company are the whelks, razor-fish, limpets and mussels,
[262] winkles and barnacles, many once used for food, but now left to grow in great numbers, to the delight of seabirds.

For anyone who wishes to have a full list of the richness of fishes found in the inshore waters of the island, there is the Harvie-Brown and Buckley volume (1888) in the *Vertebrate Fauna of Scotland* series. Of the ocean fauna, most famous of course are the common and the grey or Atlantic seals, the latter being one of the largest and most robust of British mammals. A great breeding place for the common seal is the island of Shillay, which lies a mile or two from Pabbay, off the western end of the Sound of Harris. All the island's outliers, North Rona, Sulasgeir and the Shiants, afford a place for breeding. The basking shark, the porpoise, and the blue shark are among other large creatures that frequently haunt Hebridean sea-waters.

LAND WEALTH

135 In minerals the island is poor. Feldspar was quarried in Harris
316 during the second world war, but it is doubtful whether the workings were economic. The feldspar quarries opened at Lingerbay and Northton in South Harris in 1941 employed some sixty men, the material being sent from Leverburgh for use in the Staffordshire Potteries, for the manufacture of porcelain insulators. The high-grade mineral found in Scandinavia, and the better transport facilities there, led to the close-down of the Harris quarries. At Lingerbay, however, a small quarry yields anorthosite, a white granite used as an abrasive for cleaning products. A recent survey discovered deposits of asbestos on the island of Scarp to the west of Harris.

135 For some reason there has been, through the centuries, a be-
175 lief in the mineral wealth of Lewis. As far back as 1616 the records of the Privy Council show an entry: 'Ane patent ardanit to be past to Archibald Prymrois of the copper and lead mynes in Ila, Sky and Lewis.' The Fife Adventurers and the last Lord Seaforth were also optimistic. Lord Seaforth went so far as to commission a survey on the resources of the island by a mineralogist, the Rev James Headrick, in 1800. Nothing much followed Mr

788 241 facing the sun, he cut a handful of corn. Putting the handful three times round his head, the man raised the '*Iollach Buana*', reaping salutation,—and the whole family [175] then took up the strain." While these notes by Carmichael [178] describe the custom after the abolition of the farm-team, he also tells of "all the people of the Townland going together to reap" (*Carmina*, No. 89, cf. Note to No. 90). In the days of close partnership this was no doubt a team blessing, said by the chief reaper among his neighbours in mutual aid.

782 264 [114] Grace before meals survives in Presbyterian households; and ancient graces are recorded in *Carmina*, vol. iii. The unpublished examples given here are from Miss Annie Johnston (or NicIain), Barra, to whose knowledge Gaelic lore owes so much:

1. O God, bless our portion, and our people.
2. O God, be about the beginning of our life (or food) and about the end of our life (*lit.* of our world).
3. O God, let nothing enter our bodies that may harm our souls.

A Dhia, beannaich ar cuid 'us ar cuideachd.
A Dhia, bi mu thus ar bithe (or *bidhe*)
'us mu dheireadh ar saoghail.
A Dhia, na leig dad 'n ar coluinn a ni lochd do'r n'anam.[1]

[114] [192] [1] The reader will note the meaning in translation; but he should also scan the Gaelic, and the assonance of the vowels. In the first and shortest there is a simple play upon sound and meaning: *ar cuid 'us cuideachd*—"our share (of things) and our (share of) people, friends and family". In the second, Miss Johnston thinks there may be a play upon the words 'life' and 'food' (of which the sound is almost the same), reminding one that food is the means of life and of all that life means. In the third the apposition of ideas is characteristically emphasised in the pattern of the accented vowels in the words "*dad 'n ar coluinn a ni lochd do'r n-anam*"; here again the form, by means of which it sank through the senses into the heart, marks its native origin. Contrast with these the translation into Gaelic of a common English Grace. As in the English original, its prose lacks poetic form: *Tha sinn a toirt taing dhuit, A Thigearna, airson nan tiodhlaicean a tha Do mhathas a' buileachadh oirnn, troimh Iosa Criosda ar Tighearna.* Amen.

329

The Role of Religion on the Croft

As the prestige of the old people and the control of the 593
ly-head elders over the social activities of the people has 182
isted with religious sanction, the status of the father 771
in the nuclear family has been reinforced by the religious
ession of his role. As we know, the older inter-family
erns of economic cooperation have been disturbed by the
ges stemming from the process of commercialization. This
not disturbed the position of the father as the source of
ority and discipline. He continues to play a basic role
stablishing the tempo of interaction within the home, the
ship, neighborhood, and community. He decides who will
he work and when. He determines in what social activities
wife and children will participate, always, of course,
mately guided by the venerable old men. His status is
irmed at baptism, when he is judged, and it is commonly
firmed every day in the home. For the majority of crofters, 264
gh by no means all of any sect, the day begins with the 782
ng of grace before breakfast and the returning of thanks [512]
r breakfast. The same pattern is repeated at the taking
ny food, including a cup of tea. The form of grace may
sed to cast light on the religious outlook of the Sgiathanach:
cious God, we have sinned against Thee, and are unworthy
hy mercy; pardon our sins, and bless these mercies for
use, and help us to eat and drink to Thy glory, for Christ's
. Amen."

330

In many homes breakfast is followed by family worship. 593
The father begins with a blessing, a prayer on behalf of his 264
family, and then leads the family in the singing of a few 782
verses of psalm. Next he reads from Scripture, apologizing 188
to the visitor because his Bible is not an English version, [512]
and comments on the meaning of the passage. He concludes with
a prayer. If the morning worship has been omitted, he holds [512]
an evening service. Some crofters have family worship both
morning and night. When the father is away, his wife or his
eldest son conducts the worship. Religious devotion on Skye, 771
then, is more than Sabbath church attendance and attendance
at weekly prayer meetings.

The Role of Religion in Township, Neighborhood, and Village

I did not attempt to devise a socio-metric scale to 795
determine the affiliation of members and adherents of the
several churches in either Glendale, Kilmuir or Portree. The
former disunity and conflicts which divided families, both
nuclear and consanguineal, townships, neighborhoods, and the
village stemmed from abandonment of tradition al religious
affiliation rather than from attachment to an established sect
which happened to differ from the denomination of one's kinsman
or neighbor. Today sectarian hostility is no longer prevalent
among the people. The Sgiathanach only chaffs his neighbor
in friendly sally and repartee, about his only slightly different
sectarian views. They refer to each other's sect by nicknames.
The Church of Scotland is the "Established Church." The

331

custom is well established. Even war-time restrictions and 794
rationing had little effect on Communion attendance. Skye 776
exiles in the United States and Canada sent food parcels 793
to the ministers and their kinsmen to provide for their 574
visitors. The minister takes in as many as he can. One [167]
minister, for example, not very far from Portree has a large
manse with seventeen rooms. It is customary for him to have 264
twenty-five or thirty people for lunch and again for high
tea (the Skyeman's evening meal) on Friday and the Sabbath.
Many of his guests spend five days with him.

Some idea of the size of the gatherings may be gained 794
from the need for the Free Presbyterian Church in Portree 776
to hold duplicate services. The church, I should think,
holds around 300. During the Communion Season, the con-
gregation takes over the drill hall, normally used by the
Territorial Army for training and by the villagers for social
affairs, in addition to the kirk. In the drill hall services
are held in English; in the kirk, they are in Gaelic.

Such large gatherings of people require a means to
establish meaningful contacts and create a feeling of belonging.
Thursday is a fast day. All work stops. The people attend
services in the morning, at noon, and again in the evening.
Their minister, assisted by two visiting clergymen conducts
them in a dynamic, highly emotional appraisal of the coming
event. All the ministers participate in the sermons, stressing 783
the confession of sin and the need for humiliation. Many
ministers are known for their preaching ability, that is their

353

is a sin but because of the excessive drinking and immorality 785
which might result from a promiscuous gathering. Organized 795
dances are, in general, not objectionable, Nevertheless, in [535]
spite of the attitudes of the people to these secular activities,
the Church of Scotland crofter behaves in much the same way as
his neighbor who adheres to another sect. The elders of the 888
other sects have an influence over everyone in the neighborhood. 559
Every man must ask himself, "What will my neighbors say?"

The Free Church and Free Presbyterian Church people 785
condemn any and all social gatherings where songs, stories, 795
or other diversions are admitted. When people visit, they 571
are expected to remain circumspect in behavior. They may 574
discuss their problems and gossip about their neighbors or the
wicked newcomers. They may engage in cooperative or individual
work. They may eat together in the home. They may not engage 264
in such activities outside the home. Religion on Skye for 785
the majority has centered attention on the home. Let us look 795
at some of the activities which are condemned. There is the 575
Woman's Rural Institute, an organized woman's club dedicated
to stimulating home industries in rural areas and providing
educational programs, especially demonstrations and lectures
on domestic arts. One meeting, for example, at Uig, not far
from Kilmuir, was addressed by a school teacher on the subject
of Highland Folklore. He was followed by a knitting contest
and tea. Youth Clubs and Young Farmers Clubs do not exist,
except in Kilmuir where the Young Farmers Club is under the
Crofters' Club, and, of course, in Portree. Village halls
are dens of iniquity. While we were on Skye one was built

272

272 NONALCOHOLIC BEVERAGES--drinking of nonalcoholic beverages (e.g., tea, coffee, lemonade, milk, blood); special techniques of preparation (e.g., boiling, percolating); consumption (e.g., quantities, occasions); food values and physiological effects; drinking etiquette; etc. See also:

Dozing	234	Meals	264
Cultivation of tea, coffee, and cacao	246	Utensils	415

173 "Then the tweeds got
213 going and the barley took too much trouble; so they had
282 no use for the mill."

173 A 60-year-old woman remembers, "They depended on the
242 potato and fished a lot. I was raised on oatcakes, barley bannocks, and salt herring. There were no vans and no school canteens when I was young; you had to carry your [264] own 'piece' to school. We had porridge with fresh milk for breakfast, oatcakes and butter for lunch. Dinner was at 4:00, of potatoes and fish and milk. We had meat maybe once a week. My father poached a lot. We ate the heads [251] and the roe of the salmon fresh, and salted the rest."

Once among the cleanest, Hebridean teeth now vie with
164 British cities in extent of decay. It is not uncommon for
759 a child in his first year of school to have six teeth pulled by the travelling dentist.

261 Various customs associated with food which exist today
• 272 reflect the days when fare was meager. Tea-drinking is [171] omnipresent in Britain, but in the islands it has
272 special significance. The taking of tea constitutes
514 the denouement of a visit, and almost always occurs when someone steps over someone else's threshold. To refuse [516] tea has some of the connotations of an insult; and to take only tea, without food, is to have a copan falamh (empty cup).

512 The cattle
233 knew their own sheilings; sometimes
825 they came back before milking time and stuck their heads [237] inside. They stood outside the sheiling at night, and that's how you can tell where a sheiling once was, even though the walls have fallen, by the rich green grass. Calves were born during the summer. A hollow was scooped
233 out in the peat, and lined with turf and moss. People
422 had as many as four or five cows. It was like Switzerland, only we didn't have the bells on the cows. There was lots
• 272 of milk, fresh thick cream and crowdie (clotted sour
262 [234] milk); the old people knew how to make cheese.

233 "The moor was very eerie at night, with the sound of
821 the birds. There were only a few hours of darkness
751 [513] anyway, and I'm sure we didn't get much sleep, but somehow we were always fresh. It was the air, the moor air is more health-giving. The air is different there. Ill people benefited from the change. Sometimes a person with TB would stay out there all summer. The air is heavy by the sea.

805 "There was no sense of time the way there is today.
233 If you got lost in the snow or fog, you followed the cows
221 home. You had all summer to take home the peats, to work
829 the croft, to harvest the corn. There wasn't a world, [178] there was only ourselves. That has changed since the war.

231 People kept several cattle, some of which were dry most
[234] of the time. But because everyone was keeping cattle,
[244] milk could be gotten from a neighbor. One man was
[246] planting eight or nine hundredweights of potatoes before the war, some of which would be used to feed the livestock.

511 "You couldn't buy milk then, so you had to keep a cow.
234 And even though people were weaving, they weren't getting
231 so much money as they are now. It was the barter system
288 here for a long time. So they didn't have the money to
437 buy feeding stuff. It was better to spend the time planting potatoes. Now of course there's more money in the weaving."

175 After the war, an act was passed which provided free
• 272 milk for schoolchildren. Milk for the Shawbost school
224 was supplied by a farm near Stornoway, and villagers first
178 started buying the milk from the school milk van. A strike
175 held by weavers during the war had increased the payments
178 for weaving, and the barter system had stopped. More
288 [468] money was available. As the loom was more profitable,
[437] more people stopped keeping cows, and relied on their
[231] neighbors for milk, or got their milk from the van bringing
[272] milk to the school. And as the cattle got fewer, the
178 market for bottled milk expanded. A dairy was started on
231 the west side of the island in the mid-1960's which carries
434 milk from Uig to Ness.
234

CROFTING CHANGES

The removal
of crofters from good to poorer ground was a significant factor in 241
the destitution years of the nineteenth century, with the self- 175 *
sufficiency factor becoming smaller and the dependence on im- 438
ports (when there was money to buy these) increasing. Today, 433
the crofter is of course not self-supporting, his economy being 234
based on fishing and weaving with the produce of the croft yield- 178
ing an annual average of some £200.

Acreages under certain crops show this trend to dependence on 241
the produce of mainland farmers. In the island in 1911 some 178
3,673 acres were under potatoes, the present acreage being about 433
one-third of that. The number of people per acre of potatoes for [438]
Scotland as a whole is 22 : 1. In the island it is about 15 : 1, indicat-
ing a heavy domestic consumption. Yet substantial imports of this [231]
crop are required to satisfy demand; a relevant point is that the
milking cow commonly shares the potatoes. The barley crop, once [274]
much used in Lewis's former small distilleries, has been reduced
to some 10 per cent during the past fifty years. On the other hand,
the acreage of sheaf crops, oats, rye and mixed corn, generally fed
to cattle, has about doubled. Oats in particular are in favour for
cattle fodder; even before the turn of the present century oats
were not widely used for human food, and oatmeal has for
centuries been imported into the region. The turnip acreage has [231]
halved over the past fifty years, perhaps the result of the gradual
disappearance of the horse, its steady labour and its dung being
required to put good heart in to the land.

As the crofters' cropping policy has changed over the past half 231
century, so has their animal husbandry. Animals are a main sell- 178
ing product, particularly cows and sheep. Horses, of course, have [493]
been drastically reduced from their total of 1,672 in 1911, as
tractor, lorry and van have taken over their work. And though
some cattle are raised, the numbers are now about 60 per cent
below those of 1911. At that time the density of cattle per 1,000
acres was heavy (46-60) in the north-east of Lewis, less (31-45) in
the north-west, and still less further south. The present average
is around 18 beasts per 1,000 acres. This decline, in particular [272] •
in the milk-yielding animals, has compelled Lewis to import [438]
1,000 gallons of milk a day from the mainland.

It is sheep which today claim pride of place on the croft, valued

THE PEOPLE

*175 centre of the mud floor through tons and tons of decomposing
165 organic matter or manure.'
164

The island, for all its ills and chills, had a high birth-rate and
*175 a low death-rate. Martin Martin (1695) declared: 'It is a general
163 observation of such as live on the sea coast that they are more
165 prolific than any other people whatsoever.' In some areas of the island the birth-rate was as high as 35 per cent with a death-rate of about 12 per cent. The longevity of the islanders is well known, a fact confirmed by a glance any week at the Deaths columns of the *Stornoway Gazette*, regularly recording the decease of octogenarians, nonagenarians and some reaching their century.

*175 In 1795 the island had only one surgeon. In Stornoway, 'In-
759 oculation is performed here with success by the skill and atten-
[951] tion of Mr Robert Millar, Surgeon.' Later, another doctor came to Stornoway, who attended to the sick in all parts of the island. By the turn of the century there were resident medical officers in each parish, with five doctors in practice in Stornoway.

*175 Just after the turn of the century, there was a medical club
759 in the north of Harris. This had been formed by the proprietor,
743 Sir Samuel Scott, whose crofters were supposed to pay 5s per annum and cottars 2s 6d; this subscription covered dependents. In return, Scott guaranteed the salary of a medical officer, thus securing the services of a resident doctor in the district. But there was apparently considerable reluctance to call a doctor, whether
*175 the patient belonged to the club or not. The salary of the district
759 Medical Officer of Health was £35 per annum, and from the
488 North Harris Club he received some £200. Scott also provided
178 him with a home. Dr Fletcher reported in 1906 that a complete
262 change had taken place in the diet of the people within the memory of the older inhabitants, whose accounts of what they called new diseases and lowered virility he found very interesting. Good, plain wholesome diet 'has been replaced by cheap stuff, of
• [272] questionable quality and purity. To this change there is another nondescript article which goes by the name of tea, in the use, or rather abuse, of which they are quite intemperate and from which they extract the last dregs by boiling. The result is disastrous to the strongest digestive system.'

*175 In 1892 'a well-equipped medical and surgical hospital was

561 and girls.

554 Status Equality within the Township. The ascription of status
on the basis of age and sex has resulted in a straightforward
562 system of status. The facts are simple. Men are the social
561 superiors of women. Youth are socially inferior to their seniors
Men, or women, of a common age category are equals. We shall
now examine a few interpersonal relationships to see how the
264 system operates. Unless a man and his wife are eating alone,
women never eat with men. They wait until the men have finished
576 before taking their meal. When neighbors come to visit, the
573 man of the house does not rise for a woman. He does rise for
a man and shakes him by the hand. The woman of the house, on
the other hand, rises for both men and women. Furthermore,
when a couple comes to call, the woman greets the man first.
Only after he has been offered a chair does she greet the
58 woman. Young people are seen but seldom heard. They do not
32 speak unless addressed.

326 All societies allow some deviation from traditional
78 norms of expected behavior. On Skye, as elsewhere, excessive
deviation is censured. Neither increased opportunities for
education nor the steady flow of Skye men and women to the
four corners of the earth, accompanied by the slow returning
trickle, have disturbed these fundamental values. Like the
youth who leaves home to achieve upward mobility through out-
ward mobility, the man who returns must conform to the
traditional norms, which he learned as a child, or be regarded

175 even to the extent that the St Kildans used their observations of
18 the flights of birds both as compass and as omen for good or evil.
826 Martin speaks of the islands with amusement and admiration. He indicates that the community was backward in some ways: they were illiterate, and wondered naïvely at the newcomers and their manners. 'The inhabitants of St Kilda are much happier than the generality of mankind, as being the almost only people in the world who feel the sweetness of true liberty.'

In May 1877, when the local tourist trade had hardly started,
276 HMS *Flirt* sailed from Greenock with food to relieve hardship
731 among the St Kildans, and an officer of the Highland & Island Agricultural Society on board reported that 'Tobacco was what
262 they invariably asked for'. The ordinary diet of the island consisted of, for breakfast, porridge and milk; for dinner, potatoes and the flesh of fulmar, or mutton and, occasionally, fish; for supper, porridge when meal was plentiful. Seabirds' eggs, from
272 March onwards, also formed a staple food. Tea was taken once or twice a week and the islanders were reported to be 'rather fond
342 of it'. There were eighteen inhabited houses, sixteen of which had zinc roofs, two being thatched huts. The sixteen new cottages had been erected about 1863, 'and are certainly much superior to the inhabitations of the same class of tenants anywhere in the
372 Western Isles'. All were well furnished, peat was used for fuel and
405 there were two watches and one clock on the island. There were some seventy-five islanders; most of the men were old, and only
162 two of them were unmarried, with twelve spinsters still to choose
212 from. All read the Gaelic Bible. The men were mostly tailors, shoe-
463 makers and weavers; every house had a loom. They made all
294 their own clothing, the men also making the women's dresses,
286 and a good deal of blanketing and tweed cloth was made and sold. Nearly every house had a spinning wheel and a large pot in which the yarn was dyed. The women were expert knitters. Each
462 croft and house was rented at £2 annually, sheep being charged
427 for at the rate of 9d per head; these charges were usually paid in kind.

439 Feathers of the sea fowl formed the principal export of the
435 island. The factor paid 6s per stone of 24 lb for black feathers;
237 and 5s per stone for grey. For these he received, in Edinburgh or

175 squatters without any legal hold on the land. In Duirinish
178 parish, which includes Glendale, only twenty-one families had
427 enough land to meet even subsistence needs.[62] In one Glendale
233 township, Holmisdale, some crofts of four or acres had as
166 many as fifteen people to support.[63] Part of this extreme
167 congestion was due to the continued practice of subdividing
425 one's croft when a child married. Although the population
162 in 1831 had fallen to 17,680, from 23,084 in 1841, almost
161 every township had two or three times the number of families which had lived in them in 1841.[64]

175 The loss of the summer shielings and the common grazings
178 meant few could keep sheep.[65] The looms were silent. Since
427 the rent continued to be based on the value of livestock
233 and was wholly or partially paid from the sale of cattle, all
241 oats, which the graziers' sheep did not eat, went to feed the
439 cattle. The mills were all but idle. The people had to buy
242 flour, meal, and bread imported from Glasgow. Almost all
452 were heavily in debt to the local merchants, who seem to have been newcomers with more associations with the graziers than
272 the crofters and cottars. Milk became a precious commodity.
482 Frequently, the old cow had only enough for her calf. Unable
462 to keep horses, the women became beasts of burden. They carried

585 bridesmaid(s). The house was filled each night with
[43] visitors bringing new gifts or coming to see the latest additions. Enough presents were given during this
[203] time to set up a household. Invitations to the wedding were issued verbally, by persons going around to each
[602] house. Anyone could come to the church ceremony, which was relatively informal and jovial, but only the "closest" relatives were invited to the sumptuous wedding dinner which followed the service: the bride and groom, their parents, aunts and uncles, first cousins and usually second cousins. Many more were invited to the wedding supper which started after the dinner, at about 10:00 p.m., and continued throughout the night.

Three main nights were distinguished, although
585 preparations and festivities might go on for weeks. The
252 first night was the night before the wedding, when women of the village brought hundreds of chickens, which they plucked and cooked. Meat, usually mutton, was also cooked and sliced. Butter was rolled into balls. Neighbors brought milk and other provisions and assisted in the baking for a week beforehand.

585 On the second night, hundreds of villagers ate the
[535] chickens and mutton prepared for the wedding supper,
[533] and danced to the music of a piper or other musicians.
[273] Many young boys had their first taste of beer or whiskey on these occasions.

156 154 574 178 [517] [538] [533] genealogies told, and old songs were sung or new ones composed. The concentration of expressiveness in these forms resulted in a well-developed, oral repertoire of literature and music.

The ceilidh still exists today in the form of less [538] regular gatherings. Stories and genealogies are seldom [533] recited, but songs are still sung. A few new songs are being composed. The word ceilidh is used as both a noun and a verb to mean "a visit" or "to visit," but implies a casual, relaxed atmosphere rather than a formal visit. A formal visit is made by relatives living in Stornoway, government officials or businessmen, and is characterized by more constrained behavior.

156 154 574 293 178 The ceilidh of today is often accompanied by the drinking of beer or whiskey, but a distinction may be made between a gathering which includes both males and females, and a drinking situation at which only males are present. In the past, men often gathered in barns or weaving sheds to share beer made locally from barley or 273 brought from town in a large keg. The drinking of whiskey [178] was reserved for special occasions, such as births, weddings, [434] funerals, and the festivities surrounding the New Year, but increased income has resulted in the consumption of whiskey on many other occasions. Heavy drinking is still an [275] activity engaged in largely by males, and occurs in extra-village locations such as hotels and bothans (see Chapter 6).

178 between themselves for use at a later time. A 50-year-
431 old woman observed, "They don't appreciate the bannag
like we used to. They get this kind of rich food all
527 the time." The practices of wearing costumes and speaking
178 the rhyme are disappearing. Children used to have the
bannag until they left school at age 14 or 15; now only
the younger children go. "Children grow up more quickly
today."

527 New Year's is celebrated perhaps most intensively
562 by the men, who after seeing the New Year in by watching
273 a special New Year's program on television go visiting
574 neighbors and relatives with bottles of whiskey. The
[184] custom of "first-footing" on New Year's eve is found
throughout Scotland; but in the Hebrides such visiting
and heavy drinking may last from New Year's eve until
the following Sunday. During this time, the woman of the
house, who usually refrains from drinking and to some
extent controls the drinking done by the males in her
house, relaxes her attitude, and may even participate.
The comment, "It's only once a year," is often heard.
[589] During this time, the shyest and most retiring bachelor
becomes a Romeo; this is the only time of year he may
be heard to mention the word marriage. For example, one
bachelor in his 60's chooses a "bride" each New Year, and
takes her with him on his all-night visiting.

585 on these occasions. At some point during the night the bride and groom were prepared for their wedding night together. The bride's female companions undressed her, prepared her for bed, and put her into the bed with a hot water bottle. She shared some sherry with them, and they went out, whereupon the groom was brought in by his male companions. After much joking the couple were left together.

[574] On the third night, a dinner was given for the older persons who had not been able to come to the "big" wedding.

[293] For some time after the wedding, the married couple [431] visited relatives and neighbors who had been unable to come to the wedding, taking a bottle of whiskey with them.

585 House weddings declined in number during the war when 178 food was rationed, and as more persons changed from the [342] "black house" to the less easily cleaned and more elaborately furnished "white house." Most weddings are [485] now held in hotels, and consist of a single wedding dinner and dance; they are often held on Thursdays, the day of the banais in the past. The emphasis on community partici pation still exists: even though the practice of holding hotel weddings has limited the number of guests, an effort is made to invite someone from each household in the neighborhood. In part to avoid disappointing the

764 [621] [592] funeral procession in which the coffin is carried for about half a mile from the house to the waiting hearse. Over 100 men usually walk in these processions. The more well-known the person or unexpected the death, the larger the procession is likely to be. Relatives [602] of the deceased walk at the head of the procession, at the head and foot of the coffin, while other village take turns carrying the bier. The pallbearers serve in relays. Eight men carry the coffin, four on each side, and are replaced frequently by pairs of men who assume the rear positions. The two who have been displaced at the head of the coffin stand outside the line, faci outward, until the procession has filed past them, whereupon they join the end of the procession.

764 178 273 In the past, coffins were carried for miles from the house to the cemetery. The procession rested peric ically, and the men usually carried an earthenware jug of whiskey (piggy uisge beatha) "to ward off the cold." The custom of giving a glass of whiskey to men as they left the house to carry the coffin was still recently followed in Skye; and in some areas a funeral is still evaluated by the amount of whiskey available for consum tion ("That was a good funeral"). Tales are told of coffins buried without bodies.

527 Whereas at other times of the year there are specifi
273 times which are considered appropriate for visiting,
574 especially if the visit includes a bottle, at New Year's visitors may appear in the middle of the night or at any time during the day. Some men may stay up for four
[513] nights in a row, going back home for a few hours of sleep
522 or a bite to eat before setting off again. Various prank
527 are played. Men climb through the windows of darkened
574 houses, or wake up sleepers by making animal sounds. One man went around the village showing a pig's foot to women as though it were a penis.

527 But whether lasting for one night or for five, festivities end with the arrival of Sunday; and the usua comment is, "Thank God it's Sunday."

166 The "exiles" prefer to return at such times as New
221 Year's, or during the summer months when the beaches are
484 inviting and the gales absent. They remember the
[527] "characters" and other features of village life which give it color, often forgetting the drab background out of which the color was forged. Some villagers whose siblings have married and left the island continue to live alone in the house mainly to keep the house in order for their return. "I wouldn't close the house on them. They come back every summer." A man thinking of emigrating

203 one night of the week in which controls are imposed, by
215 the arrival of Sunday when no one is supposed to drink.
[470] The bothan was occasionally open on Friday night, and
on Monday night. ("If there's anything left from Saturday
night, we finish it on Monday.") During the summer of
[281] 1971 when the days were long and filled with communal
township activities such as peat-cutting, the bothan was
open every night of the week. The bothan closed when the
man supplying it with drink suddenly died, and has not
reopened.

2. Functions of Drinking: If a man decides not to
203 participate in drinking, he is not praised for his self-
571 control or his ability to abstain; rather, people say,
156 "What's the matter with him that he doesn't mix?" A man
goes off to the hotel or to a bothan "for a wee nip" or
"for a pint" (the pint of beer which serves as a chaser
for glasses of straight whiskey). Both phrases are
euphemisms for the huge amount of whiskey and beer which
must be consumed if a man is to satisfy the canons of
social intercourse which obtain. A man can drink alone
or, in the company of others, drink very little only at
great social cost.

"You can't go in for a casual pint in a place like
the bothan because it's a place where people mix, and
you're bound to meet old friends you haven't seen for

203 571 a while. It would be an insult not to take a drink with
156 them; you mustn't miss your round."
[576] The usual practice when drinking with friends is
203 for one person to buy the drinks; everyone drinks
571 together, and then someone else buys the next round. To
156 drink slowly is to indicate that you intend to miss your
round. A relative who returns to the island for a holiday
usually pays for more rounds than he receives, and may
spend as much as £20 in a single week.

If a man wants more drink than his fellows, he has
several choices. He may step up the pace of drinking by
buying more rounds, which means that he is likely to pay
a larger share than the others during the evening as they
will be ready to quit before he is; or he may keep a bottle
hidden outside the room, and disappear periodically for a
private nip, after which he returns to the group.

As incomes have grown, excessive drinking, which was
once confined to a small number of occasions, has also
203 increased. In the days when money was scarce, people shared
571 with others what they had. Elaborate and relatively lavish
156 ceremonies in which all community members participated
178 were possible because of the contribution in labor and goods
1234 of members of the community. The custom prevailing today is
to use the added money not to purchase more goods and services,
to travel, or in other ways that might result in both social

203 differentiation and differentiation in personal experience,
571 but to use it in the community, as social coin. The few
156 men who refuse to get involved in drinking episodes that
[434] would deplete their available funds are called "mean"
and "tight-fisted."

"If I had a wish, I'd choose to live the same life all
over again, maybe a wee bit roughes. We don't get a chance
here. The poverty keeps us down. But what does it matter
to be a schoolteacher or a minister? What good does it do
you? If I have a shilling in my pocket, I've got to spend
it. I remember ten years ago, I went into town with £60
in tweed payments to buy a new stove. I met some of my
[435] pals, so I put £20 down on a £50 stove and spent the rest.
What a time we had."

"I went for a holiday on the mainland and came back
[484] with money in my pocket because it's no use drinking in a
place where you don't know people. You want a yarn."

Drinking occurs at night behind the gray, concrete
203 shield of the bothan or in hotels. Drinking situations
571 provide opportunities, rare in the repressive arena of the
156 village, to express emotions and ideas. These expressions
can always be retracted in the cold, sober light of day.

"I used to be an alcoholic. Now I spend most of my
weekends feeding my brother lager so he won't get the DT's.
When something good happens, I wish like hell I could get

[Page 159 is blank, text continues on p.160
--Analyst]

203 out and celebrate. There's no other way to express
571 ourselves."
156

"Now that Ruaridh has stopped drinking, he's not
very interesting to talk to. He's very dull these days.
He doesn't say a thing."

During the Communions, a sense of excitement and
203 holiday permeates the village. Among the converted
571 members of the Free Church, this feeling is expressed in
522 rigorous participation in long church services and meetings
364 in the homes of the converted. In the rest of the village,
794 the unconverted sun doon their best suits and head for the
hotel, or the bothan opens earlier in the week than usual.
All special occasions such as funk days or the arrival
of relatives generate excitement, which is most often
expressed, among the unconverted men, by drinking.

A man may propose to a woman, and the next day "forget"
203 this rash action with impunity. When a man has been
571 drinking, he is more likely than on other occasions to
[584] be openly affectionate to a woman, or to express strong
feelings of friendship to his fellows. "It's the only
time when you're really happy. You can sing, tell your
life story. It's the only time when people are really
friendly. But it's a false friendship, because when you
meet someone the next day, he's not the same person. He's
distant, cold. You feel depressed. You want to recreate
the situation, so you start drinking again."

781 3. Bible vs. Bottle: An islander living on the
273 mainland once observed that the Free Church plays cat
571 and mouse with members of the community who drink heavily.
794 Death is a common event in a community which has a large
[161] number of old people, and the theme of death appears
repeatedly in sermons and in the conversations of those
who have undergone religious conversion. The temporary
pleasures of drink are contrasted with the eternal joys
awaiting those who have been saved. The "false" friend-
781 ships of the drinking situations are contrasted with the
794 more lasting, consistent relations which characterize the
clique of the converted. "You have lots of friends when
you get converted, and they don't change overnight the
way your drinking companions do."

203 "With the drink it's easy to get started and just not
571 be able to stop drinking, especially with the money there
[534] is now. Everything's unsteady here except religion."

Many of the most deeply religious male members of
203 the church were once heavy drinkers. One villager observed,
571 "If a man went to extremes as a sinner, he'll be just as
133 fanatical when he becomes holy. Had it not been for
78 religion, some of them would have landed in Craig Dunain
[143] [the mental hospital near Inverness]. The talk is forever
on religion. That keeps their mind at rest."

781 meetings. If a woman converts when she is off the island,
273 it occasionally happens during the first year or so at
[302] university or other school, the tell-tale sign is that she
begins to let her hair grow, and wears it tied back in a
bun.

The word curam means "conversion," but is also used
in ordinary conversation to mean being careful, such as
keeping one's clothes tidy. It also means to be circum-
spect. In a religious context, it means to be careful of
one's behavior, as this behavior reflects on the state of
one's soul. When a person "has the curam," he has demon-
strated that he is "in a state of conviction," that he
781 has undergone conversion. People say, "A change has
794 come into my life." The "change" includes the cessation
795 of drinking and going to dances and concerts. Woman stop
smoking. "After you are converted, you don't watch TV on
Sunday. You should do everything for Sunday on Saturday,
like shine your shoes for church or cook the Sunday dinner."

A dramatic change in behavior is often found among
781 men who have had a history of hard drinking. One man went
293 into the bothan, raised a glass to his lips, but never
drank. "He put it down and walked out. They put the glass
of whiskey aside, expecting him to return. He was a hard-
working man, one of the hardest workers in the village,
but everything went to booze in the bothan. He slept in

781 the same room as his father. His father used to lecture
273 him, but he closed his ears. Then his father died. The
week after he walked out of the bothan, a relative sent
him some money. He had been trying to buy a suit on
installment, but always spent the money on drink. He
went into town, got the suit, and wore it to church the
next Sunday."

781 The process of conversion is often accompanied by
153 feelings of restlessness, inability to sleep, scriptural
passages running through one's mind, alienation from normal
surroundings ("A voice kept whispering, 'this is not your
home'"), and occasionally visions, all of which events
serve as signs to the person that he is indeed converted,
one of the few chosen by God for salvation. As children
[167] are taught from an early age in both school and Sunday
school to memorise Biblical passages, it is not surprising
that such passages often come to mind easily, and, during
a stressful, disorderly time of life may be interpreted
as messages from God which promise order and relief.
Evangelical services are full of doom, the imminent possi-
bility of unexpected death, and exhortations to convert.
Conversion is often traced to a minister's preaching.

"I was like an animal. I didn't care whether God
existed. Then my wife died. It was when I saw the coffin
that something happened inside. I was converted six months
later."

241 Cultivation for subsistence is minimal, and in
651 part stems from government-defined privileges and duties
regarding maintenance of a croft. The Harris Tweed
203 industry, which is restricted to the Outer Hebrides and
571 thus is protected from competition, has provided work
for a large number of islanders. Many of the younger
[124] members of croft families live in cities on the mainland,
and send part of their wages home; they return regularly
to the island, and many plan to retire there. Thus the
[162] township supplies urban workers who remain very much
attached to the rural townships, which are composed of
511 good family members and a rural proletariat. The standard
203 of living is high, and many crofters have accumulated
[273] savings, although much of this surplus is used by the man
for alcoholic drinks.

121 In Britain, rural communities have been interpreted
as lying somewhere along a rural-urban continuum (cf.
Southall 1959, Frankenberg 1966). In 1959, Southall
presented "an operational theory of role" by which he
suggested that heterogeneous societies may be analysed
and compared. He developed the concept "density of role
texture" to describe societies which lie along a continuum
from rural to urban. Frankenberg (1966) uses Southall's
concept along with other concepts to present a more
complete model of an urban-rural continuum. The "models"
of both Southall and Frankenberg are essentially lists

AGRICULTURE AND FISHING

241 conditions backward. He tells us that the Island of Lewis had been
*175 fruitful in corn until late years of scarcity and bad seasons. The
crops were barley, oats, rye, flax and hemp. The natives showed
great industry in digging the ground with spades—a practice
which he invariably associates with a large return. He even records
* [273] that the abundance of corn had once been such that it encouraged
them to 'brew several sorts of liquor'. For manure, sea-ware and
[409] soot were used. And harrow had two rows of teeth and rough
weather in the third row. Tennant's visit to the island in 1772
found that the produce of the land was insufficient to support
the population. Distress was rife.

In Martin's time, although the economy was more or less self-
[273] sufficient, a certain amount of produce was available for export
or for translation into 'several sorts of liquors, as common usque-
baugh, another called trestarig id est, three times distilled, which
is strong and hot.' One assumes that this produce was surplus to
[237] the requirements of the island's population. The livestock con-
sisted of 'cattle, horses, sheep, goats, and hogs'.

TACKSMEN AND TENANTS

*175 Most of those who held land had leases: tacksmen, who paid
241 rent for large tracts of land and who, by settling suitable tenants
420 there, received rents, in money or in labour, as an additional in-
come from their farms. These smaller tenants had no leases: they
could not write and were subject to the tacksman's favour. In the
early eighteenth century, the rental rolls for Lewis, preserved
among the Seaforth Papers in the Register House in Edinburgh,
show that most of the tacksmen—sixty-four in number—were
MacKenzies, indicating that they were adherents of the Seaforth
(MacKenzie) family on the mainland, who had received the lands
from royal hands as the reward for their fidelity. The smaller
tenants, who generally lacked surnames but were known by their
personal characteristics, numbered over 200; there were also
above eighty tenants in Stornoway.

Rents were paid either in money or, more often, in meal, mut-
ton, sheep, butter, tallow or salmon. When it was proposed to sell
the Seaforth estate of Lewis in 1772, particulars of the Lewis

TRADE AND INDUSTRY

286 womenfolk, giving a ratio of only one male weaver to fifty-five
462 families. In Lewis, male weavers were more common: one to
*175 every twenty-five families. The making of whisky was introduced
433 about the seventeenth century. This was in addition to the old
* 273 drink of home-brewed beer or ale *(lionn)*, and much of it was
*175 made to pay rents; it must have consumed a considerable quan-
433 tity of valuable foodstuff. However, the spread of distillation as a
[409] legitimate home industry by which the rent could be paid, in kind
[237] or by sale, was followed by legislation prohibiting all but very
[280] large stills; illegal distilling of course went on in a small way.

It was, then, by a very narrow margin that subsistence was won
*175 in the island some two centuries ago. Many times famine showed
511 how close was the wolf to the island doors. The introduction of
the potato, and the interest in the fishing industry led to an in-
crease in the population, though as discussed in Chapter 3 this in
turn brought more problems. Basically, the island economy had
never been organised on a sound foundation, with the result that
winds of change blew where they would with little or no control.

A new factor in the island economy was introduced after 1750.
*175 This was kelp-making, the cutting and burning of seaweed on the
224 shore for subsequent use in the manufacture of alkali for the glass
323 and soap industries. The first tentative move in the island was
318 made by MacLeod of Harris in 1746, when he allowed some
433 Irish labourers to make kelp on his shores; so little was the pro-
duct's value realised at the time that he only charged them 2s per
ton manufactured. As the burning of kelp came to be understood,
and the marketable value of the product ascertained, the native
population set to. Between 1772 and 1864, about 50 tons were
produced in Lewis each year, compared with some 800 tons per
annum in the Uists; the Harris figure was 500-600 tons. The
growth of the industry began to snowball, with the Minister of
Lochs, writing in the *Old Statistical Account*, states that at the
time (1796) some 50 tons were being produced in that parish
[820] per annum. In Stornoway parish, though no figure is available,
the minister reports that kelp-burning was the principal manu-
facture, and that everyone able to fill a creel, or carry one, was
employed at it for about three months of the year. Little of it
seems to have been done in Barvas parish. The price of kelp varied

BRICKS, PRINTING, WHISKY

800 tons and had a steam-driven winch. The slip has also 396
vanished—except for the name of the Patent Slip Wool Mills, *175
which produce Harris Tweed.

Other small industrial activities in the island during the nine- *175
teenth century included the business of Alexander MacPherson, 204
chemist, druggist, stationer and printer, who set up in Stornoway
in 1842. He brought across the Minch with him Lewis's first
demy-size hand printing press, which was still in use on 1 January
1889 to produce the first issue of the short-lived *The Lewis-
man*. Copies of this earlier Lewis newspaper can be seen at Storno-
way Public Library. Early in the 1890s Thomas Nicolson also
set up as a printer.

Whisky was once an important product, not only for local 273 *
consumption, but also for export. One of the Privy Council's 214
main indictments against the islanders in the Hebrides in 1622 *175
was that they seized any cargo of wine and spent 'bothe days and 439
nightis in thair excesse of drinking'. The council therefore enacted
that masters of vessels sailing Hebridean waters should carry no
more wines. It has been suggested that this and other measures
were responsible for the beginning of illicit distilling, which in
Lewis continued overtly as late as 1827. One of the two prin-
cipal stills established by Lord Seaforth in the island at that time
was at Coll, a few miles from Stornoway, the other at Gress, a
few miles farther on. Such was the fame of these stills, both for
output and quality, that it was hard to choose between 'Coll' or
'Gress'. Sometimes, the product passed as an article of exchange [436]
in the island, and the factor received a considerable part of the [421]
rents in it instead of money. In 1827, a survey of crime in the island [439]
Stornoway had good characters; considering the population num-
ber compared with the large influx of strangers to Stornoway
during the fishing season, local people emerge as more law-abiding
than the national average. Miscellaneous petty crimes were
numerous enough, however: minor assaults, breaches of the
peace and disorderly conduct, occurring mainly in Stornoway. [273] *
Much of this 'crime' was traceable to drink. The island's first [682]
and only murder occurred a year or two ago.

CRIME

CRIME

Serious crime is rare in the island, though it was not always so. *175 *
Some light on the life lived in Lewis nearly two centuries ago is 204
found in the old records of the Sheriff Court of Ross County. The 673
first minute in the records concerns the appointment of George [217]
Munro, Writer in Dingwall, as the first Sheriff Substitute 'within
the Island of Lewis'. The date is 1788. Munro's commission em-
powered him to sit 'in the town of Stornoway or anywhere else
he may find most eligible at the same within the said Island of
Lewis and hold Sheriff courts there, judge, decide and determine
in all causes civil and criminal coming before him.' In those days
a case might be raised in any of the county courts. In 1788, a *175 *
regulation was made to save defenders from unnecessary trouble, 641
hardship and expense in travelling to relatively distant courts
where actions were raised against them; litigants had, before
Munro's appointment, been faced with a long and hazardous
journey to either Dingwall or Tain on the mainland.

The old Court Records date from 1788 and 1826 and record *175 *
a number of interesting cases. Sheep-stealing was common, but 264
other forms of theft less so; this is indicated by the fact that much 217
of the Court Records are taken up with the minutiae of court 685
appointments. In a case concerning wrecking, Lloyd's of London
are mentioned as being represented in Stornoway as early as 1824
if not earlier. The defendants were fined £4 for destroying the
mast of a ship found by them in Lemreway, in Lochs.

In a report dated 1827, a survey of crime part of the *175 *
the person and offences against property) revealed that Lewis and 264

342 later times the landlord might supply timber. Long
343 ago a main source of timber was the shore. The length
[313] of the house may be fifty to sixty feet, and the inside
breadth ten to twelve feet, spanned by ten or a dozen
[172] pairs of couples on which are laid transverse 'cabers',
[198] which may be tree trunks, branches, odd wood, old oars,
or, exceptionally, sawn timber. The tops of the walls are
353 finished with turf to keep the driving rain from being washed
out, and to provide a smooth bearing for the couples, the
ends of which are pushed into the turf so as to bear on
the inner half of the wall; the rounded form and absence
of overhanging eaves prevent a gale obtaining purchase
on the roof, but a gable with chimney is now usual on the
356 end wall of the inner room. The rafters are usually
covered with laths, and the roof is thatched with thin, short
barley straw, which was pulled up, not cut, after the ears
were picked off, the roots gripping well, and the stem
hanging outward and down.

353 The door gives direct access to the byre (*bathach*),
through which one reaches the middle part, or living-room,
'at the fire' (*aig an teine*), from which there opens the
innner part, or 'room' with bed-closets. There is no
ceiling to the primitive house, the row of box beds having
tops to keep off the drips of rain water. In the middle of
the earthen, sanded floor of the living-room is the circular
hearth, built of stones with clay between, and raised a few
inches, with no chimney.

313 In the byre, the manure accumulates from spring to
spring, and a breach is made in the end of the house for
the annual removal of the manure. There are no privies.
Where there is fodder and straw in any quantity a barn
342 is added. Stacks are rare because of wind. A low wall,
343 continuous with the house and barn, may enclose the kale-
351

342 yard and occasionally a barley-kiln in which to dry grain
343 before malting it for home-brewed beer. A 'black mill',
351 with its primitive horizontal water-wheel, stands apart by
[251] some burnside.

Round the circular hearth, a large company can assemble
in very social fashion for talk, story and song, the meeting
354 *together* (*ceilidh*). By the transfer of the hearth from the
571 centre and the substitution of a gable fireplace and regular
538 chimney, the social centre is shifted, while meantime the
[178] tales of the *ceilidh* are forbidden or forgotten. Happily
[353] the bench still stands against the wall, near to the open
door, through which neighbours slip in with a word of
greeting to find a customary welcome.

342 The dwellings on the summer pastures out on the
343 moors show great variety, illustrated in Fig. 10(a). A simple
361 type in use is built of turf and stones, lightly roofed with
[178] turf placed on spars. A more primitive 'beehive' type
[171] (which fell out of use before 1900) was stone-built and
corbelled, probably for lack of timber. And whereas the
lighter type always stands by itself, the corbelled type was
added to until a dozen cells formed a small mass, suggestive
of ancient 'neolithic' hamlets as at Skara Brae in Orkney,
described by Childe, and of the domed, corbelled huts of
the ancient East.

[343] A further type was the 'spring house' of Tolsta, NE.
Lewis, in which both cattle and folk sheltered in spring a
little way from the village, before going out to the more
[124] distant moor. Mr. Donald Macdonald, F.R.S.G.S., a
[198] native of Tolsta, informs me that the spring house was in
use until 1936. He remembers vividly how life in the
shieling restored health and colour after the winter.

175 About the seventeenth century there was introduced
433 the making of *aqua vitae*, *uisge-beatha* or 'whisky', an
addition to the ancient drink of home-brewed beer or ale
* 273 (*lionn*), a pleasant brew still tolerated by the Excise. In
[172] order to pay the rent, the making of whisky from home-
[251] grown barley must have consumed a precious foodstuff.
The small bulk of whisky facilitated export by tacksman
or Factor, and it also served to tickle the palate, cure the
[651] ills and cheer the spirits of the crofters themselves. But
before 1800 'the Gauger' was in the land, though there
were undoubtedly whisky stills that escaped his eye. In
some of the old houses a hollow spot was left at a secluded
spot between the inner and the outer walls, to conceal what
was not meant to be seen. A pleasant picture survives of
[511] the eighteenth century. It is told of a man of exceptional
prosperity, that when he laid his head on a pillow "he
could hear on the one side the clacking of his corn mill and
on the other the babble of his still". What more could
[172] the good man want? Nevertheless, the increase of distilla-
[671] tion as a legitimate home industry by which to pay the rent
(in kind or by sale), followed by legislation prohibiting all
but large stills, first encouraged the Islanders in a taste for
strong drink, then tempted them to smuggling and breaking
the law.[1] Seaforth started two distilleries at Stornoway,
importing barley for the purpose. By 1825 these had ousted
the illicit stills, but they were closed about 1870.[2]

From a perilously narrow margin of subsistence, periodi-
175 cally overstepped in famines, the Islanders passed to a
176 larger measure of production for sale, and in the second
433 half of the eighteenth century population increased. Its
433
[113]

[2] Brand Report, 1902.

Chapter 6

THE BIBLE AND THE BOTTLE

571 794 273 Two of the most important networks in the village are the converted members of the Free Church, and the drinking fraternity of the males, especially the unmarried males who lack the obligations of married men, and who can therefore drink with greater freedom.

A. The Bottle

273 175 The word "whiskey" (or "whisky," as it is spelled in Scotland) is almost synonymous with "Scotland," despite the fact that the earliest reference to whiskey in that country appears only in the late 15th century. The word is derived from the Gaelic uisge beatha, "water of life," a translation from the Latin aqua vita.

Martin Martin (1716: 3) describes the types of liquor made from "corn" in the Outer Hebrides as Common Usquebaugh, Trestarig (three times distilled), and Usquebaugh-baugh (four times distilled). He states, "...two spoonfuls of this last Liquor is a sufficient Dose; and if any Man exceed this, it would presently stop his Breath and endanger his life."

273 175 65 [656] Excise taxes were first levied on whiskey in 1814, and stills of less than 500-gallon capacity were prohibited. Local, illegal distillation continued for a long time after 1814, and throughout the Highlands and Islands tales are told of "the excise man" and how he was outwitted.

273 175 [66] The Island of Pabbay in the Sound of Harris was evacuated in 1843, supposedly because of illegal distillation that was being carried on there. The ruins of old distilling houses are found throughout Shawbost. Villagers say that these were used in the time of their grandfather or great-grandfather to distill whiskey for occasions such as weddings.

[527] [846] In Shawbost, until recent times whiskey was associated mainly with special ceremonial occasions: the birth of a child, weddings, and wakes. When a baby was born, the father went into town for whiskey to be given to visitors

764 273 coming to see the baby. Having whiskey at a funeral was so important that many a widow sold her cow to provide it, so that people would not say it was a bad funeral. A custom of sitting up all night in the house of the deceased has stopped, probably in part because a prayer meeting lasting from midnight until 2 a.m. was introduced with the intention, according to one minister, of preventing

273 175 [527] [585] the wake from becoming too joyful an occasion. Whiskey was abundant at New Year's, and at weddings. "The dance

273 175 585 [at a wedding] would be held in the barn, with sheets lining the walls so that if a man staggered against the wall he wouldn't dirty himself. There were four and one-half gallons jugs of beer and a few bottles of whiskey. Sometimes someone would spew on the floor. People got drunk on very little, because they didn't have it so often."

273 175 Occasionally the word went out that someone had brought a jug of beer from town, and the men gathered i someone's barn or weaving shed, usually on a Saturday night.

273 175 829 "The war changed that. When you were at sea, you lived from day to day. There was no tomorrow." "When my brother was away at sea, most of the money he earned was saved for him, and when he got back we gave it to h to do whatever he liked with it. The men would go off town drinking. They had money, and they had nothing el to do; and they had learned to drink during the war. Maybe if the TV had been around then they wouldn't have started that kind of drinking."

175 295 273 [671] 1. Bothans: Because most parishes in Lewis were "dry," that is, no licensed purveyors were allowed, a journey of many miles had to be made to purchase beer a whiskey in Stornoway. Around 1930, Nessmen (many of wh were sailors) began to bring back from town several keg

175 of beer at one time to avoid having to make the 50-mile
275 round trip very often. Men met to drink in barns or in
273 tigh ceilidh, the houses in which people gathered for evening visiting, but for this purpose eventually built huts of stone or concrete, or used shelters already available such as the shells of old buses or Nissen huts built by the armed forces but no longer used by them.
[361] These shelters, separate from the rest of the village, were called bothans. One or a few men brought the drink
275 from town, and the drinks were sold at cost. In 1963
273 a bothan was raided by the police and the men fined.
625 But in 1967, a court case found six men not guilty of
681 trafficking in exciseable liquor because there was no evidence that money had changed hands. The lawyer for the accused men argued that the drink was not "for sale." It was simply available, and drinkers made "voluntary" contributions to a common kitty.

175 The first bothan in Shawbost was started after the
273 second world war, by a sailor home on leave. Liquor was
275 brought to an old Nissen hut, which eventually was replaced by a small concrete hut with gas lighting. ("It was built overnight, because if anyone knew it was being built, they would protest." "It was built inside the Nissen hut so no one would know. On the day they were tearing down the Nissen hut, a minister was passing by and he praised

273 the Lord that his prayers had been answered.") Another
275 bothan was started in an old bus.
[175]

Today only one bothan exists in Shawbost. It is a
[354] small concrete structure, lit by gas and heated with coal, which is burned in an expensive fireplace. Like most bothans, the one entrance faces away from the main road. Unlike most bothans, it has a small window which is curtained but nevertheless reveals whether or not the light is on inside. Most bothans present blank, windowless and doorless faces that give no indication whether or not the building is occupied.

[208] Every three years a poll may be taken within a parish to determine whether the parish should be wet or dry.
[66] After the parish of Uig voted itself "wet," the Doune Braes Hotel was opened in Carloway, only five miles from Shawbost.
[829] One of the arguments for making the parish "wet" was that drinking at the bothans would cease, and men would drink under more controlled circumstances. "The married men usually went home from the bothan at a reasonable hour, but the single men just stayed there talking all night. At the hotel, they have to go home at 10:00."

Despite the opening of the hotel so close to Shawbost, the bothan remained open. The drink was cheaper and the atmosphere less formal. Unlike the bothans in Ness, however,
[771] the Shawbost bothan was usually open only on Saturday, the

character traits just by virtue of his belonging to a particular family; he is protected from the "out" world even though he may have broken its rules. The village provides a colorful arena of recreation in the form of ceilidh, the character, and holidays such as New Year's.

A major system of order and meaning is provided by religion, and by the opportunity to belong to a tightly-knit religious clique. Lewis is sometimes called Tir an t-soisgeul, Land of the Scriptures, in contrast with the decadent outer world. The male drinking fraternity constitutes a second important group. And for everyone there is the cinema of their neighbors' activities, which are placed in a vast human calendar that includes the behavior of many generations.

[251]

a own family of procreation or ceases to be an integral
ber of the social units. Many features of these relation-
ips will persist throughout his life.

The Church treats the event of birth as something
which man is only the agent of a higher power. This fact
s brought home to me one night during a discussion of the
blicating size of families. The question of subsidies to
courage larger families was broached. Although all take
vantage of government grants for their stock and care of
r land, this form of subsidy was unanimously rejected. As
e man said, this would place man in the unthinkable position
m-creator. Only the essential arrangements for the care
the mother and her expected child are made before birth.
ere are no "showers." "Showers," said one woman, "how can
u tell if the child will be a boy or girl, or even live?"
ny most women go to the maternity hospital at Uig for the
livery, but a few prefer to remain at home under the care of
ir mothers. To expect that the father's mother would take
ge, even under the clan system, would be carrying the
ditional emphasis too far. Within a few days, the chil-
ldions of the parents, their relations, and the people of the
nship become apparent. One by one the individuals and
ples make their way to the cottage to welcome the child.
ndividual visiting is a modified survival of the old
tom of "kirking," a group offering of thanks, at the church,
a safe mother and a healthy child, followed by a dance
feast at home. The parents are obliged to provide a
n of whisky so that all the visitors can toast the child.

[257]

[256] was the first place he had ever moved where his men did not
have to look up their tools at lunch time, and the women
[258] were not broken as fast as they went into the frames. Still
there is some theft.

As might be expected in any area of low per capita
income and seasonal employment, some people succumb to temp-
tation. Children, now and then, find the temptation of a
handy bar, a sharp pocket knife and other such items which
[259] shopkeepers say have on the counter too strong to resist. The
striking thing is that they always share their loot with
their schoolmates. Around New Years, when unemployment
[260] is at its height and a man needs his bottle to see in the New
Year in the traditional way, some men turn to theft. It
never takes the form of house burglary or armed robbery. As
far as I know, the only case of armed robbery in which a
man from Skye was involved happened on a train in England.
His weapon was a rolling pin. The people at home were very
amused when he said he was taking the rolling pin to his
mother. The usual forms are to take a cow or sheep or to
[258] loot a shop. No answer can be given to the question, how
much theft is there? The responses vary. "If you land on
the corner and forget who you were, they'd have you off in
five minutes, so they would," was one man's opinion. The
police say, "There's quite a bit of it." An old whisky
smuggler told me, "There's no theft around Portree, but you're
out wife with five pence in your pocket in Stockport." This
[258] obviously is an expression of neighbourhood loyalty. Note,

[297]

becomes too worked up, he is expected to withdraw. On occasions,
such as wedding, when all have and their share of the water
[262] beatha (water of life), there may be heated quarrels, including
the raking over of old clan feuds. Again, some older man will
[263] take the offender in hand, "It's not you that's talking, Murdo,
it's the drink." The man almost invariably expresses regret
for his outbreak later. Political meetings, often explosive
situations in a democratic country, may involve some heated
debate, but the code of etiquette is never breached. When one
politician objected to the Tilmir spokesman that according should be
done to stop depopulation because soon they might not have
any young men for the army, the people were indignant, but
they remained quiet. In the case of the cattle thief,
cited above, no one lost his temper. In that instance, there
was discussion almost in a monotone.

Perhaps still talk about the one outstanding example of
aggression which has occurred recently in Portree. At the
end of World War II, a collection was made for the benefit of
the returning servicemen. A public meeting was held to discuss
what would be done with the money and who was eligible to
receive a gift. The young men, both of whom had spent several
years in a German prison, and had been drinking, became
boisterous. They accused the committee of spending the money
and trying to cover it up. The chairman left the meeting. His
replacement, a newcomer, restored order by threatening to call
a policeman, something which never had been accepted at a
public meeting. The boys were forgiven because they had been

[298]

the nearest kin carry the body from the house. The custom
is to carry the coffin until the procession is out of sight
of the house. This may mean a few hundred yards or several
miles. Once the body was carried all the way to the grave.
One sceptic said this is why Skye has lost so many people,
"half of them died carrying the other half to the grave." In
Portree the body is carried across the bridge on the far side
of the town. All the mourners, except the women who remain at
home, and the two nearest kin who walk before and after the
coffin, are given an opportunity to carry. They continuously
change positions with the carriers, stepping out at the head
of the line by ones and waiting for the coffin. Those who
have carried fall in at the rear of the procession. When they
reach the graveyard, the original carriers, his nearest kin,
remove the body from the hearse and lower it into the grave.
At the grave the minister delivers a short lecture on the merits
of living in the mortuse of God. Only the Church of Scotland
ministers offer an additional prayer for the family. The other
sects believe a prayer at the grave is a prayer for the dead.
Following the interment, the bereaved family provides the
mourners with a dram of whisky. Does the minister take a
dram? I can only give the reader the answer I received after
one funeral. One fellow said, "I guess nobody sees him take his
drop, but if he didn't I'd be surprised." On the following day
life returns to normal. The equilibrium of interaction has
been restored.

[298]

her brothers and their wives come to visit, and at New Years
they come by with their bottle of wine, whisky -being a man's
drink, to toast the New Year.

Excepting Glendale, where church membership and af-
filiation is synonymous with the neighbourhood, the township
may contain affiliates of two or three churches. One small
township contains two Free Church families, two Free
Presbyterian families, and one Church of Scotland family.
As in any township, they visit one another and cooperate
in handling the sheep fleece. Further, the Church of
Scotland family visits with the train on the Sabbath
and drives everyone to Church. This is one of those isolated
townships far off the beaten track. Although I certainly
agree that people who meet together at a church and pray
together yet to know each other better because of their
religious unity, in this township the families have come
of living in the mortuse of God. Only the Church of Scotland
ministers offer an additional prayer for the family. The other
sects believe a prayer at the grave is a prayer for the dead.
Following the interment, the bereaved family provides the
mourners with a dram of whisky. Does the minister take a
dram? I can only give the reader the answer I received after
one funeral. One fellow said, "I guess nobody sees him take his
drop, but if he didn't I'd be surprised." On the following day
life returns to normal. The equilibrium of interaction has
been restored.

[299]

functions? Certainly not the kirk session. But since they
share a common tradition, which is reinforced by interaction
and mutual respect, the elders impose more or less common
standards. The nurse are the by-product of the history of Skye.
If there was clearage, might not the behavior of the
people begin to diverge? In Kilmuir there are three sects.
Two of them have churches. The Church of Scotland is in the
majority. The Free Presbyterians are a definite minority.
I think there is only one family of them. Although several
ministers of the Church of Scotland have begun to follow
the example of the national church elsewhere in Scotland and
celebrate Christmas, at least on an appropriate Sunday,
there is no Christmas in Kilmuir any more than there is in
Glendale. The custom is said to be "popish." Naturally,
if the birth of Christ is not celebrated, his rebirth cannot
be commemorated at Easter. All churches, on the other hand,
celebrate New Years, which is also the traditional time to
exchange gifts among members of the family. It is a time
of license. After midnight the people of the township
practise "first footing." Until early in the morning, the
people make their rounds exchanging visits and toasting one
another and the New Year with whisky, for the men, and wine,
for the women. The people of Kilmuir are noted for their
inter-relationships. "You have to watch what you say up
there," I was told, "they're all relatives and friends of
each other."

The situation in Portree for the Sabbatarian is much the same

26Ross, Op. cit., p. 127

[300]

several agencies who have taken the task of bringing movies
to the remote crofters in the belief that the Highlander is
more likely to stay if he has a share in the life of the
Lowlander and the Sassenach. These agencies want to "create"
a more adequate social organization.

Out of Portree, more young men try to add some spirit
to their lives by turning to "the drink." Although the
religion of the Bayanan is strikingly similar to that of
the rural dwellers in Tales, I found the Balakaan and the
Sriathanach here quite different views on the subject of
temperance. Both are in the Bayanan support temperance, from the
pulpit and from the kirk collections, but abstinence or
prohibition has never been accepted. Perhaps, their main
reason for consistently rejecting the idea is their want
to base many of their decisions on Biblical directions.
There can be nothing inherently wrong in the infallible Word
of God. Then, too, to the Sriathanach, whisky is not Scotch;
it is the "water of life." The importance attached to the
dram can be judged from its functions: at birth, marriage,
and death. It is also the means of thanking a man for doing
a favor which cannot be repaid. Thus, while abstinence is
a major religious tenet for the Welsh, temperance is the
aim of the Bayanan.

The temperance movement has had an effect, all over
Scotland. The "pubs" are no more than a long car ride in a
bare room. I know one who lives a great time in England, where
the local "pub" is a closely knit club for the villagers, frequently

274

CROFTING CHANGES

The renewal

[291]

of crofters from good to poorer ground was a significant factor in the
the dominion years of the nineteenth century, with the self-
sufficiency factor becoming smaller and the dependence on im-
ports (when there was money to buy them) increasing. Today, up
the crofter is of course not self-supporting, his economy being
based on fishing and weaving with the produce of the croft yield-
ing an annual average of some £200.

Acreages under certain crops show this trend to dependence on
the produce of mainland farmers. In the island in 1911 acres of
3,673 acres were under potatoes, the present acreage being about
one-third of that. The number of people per acre of potatoes for
Scotland as a whole is 22:1. In the island it is about 15:1, indicat-
ing a heavy domestic consumption. Yet substantial imports of this
are required to satisfy demand; a relevant problem is that the
milking cow commonly shares the potatoes. The barley crop, once
much used in Lewis's former small distilleries, has been reduced
to some 10 per cent during the past fifty years. On the other hand,
the acreage of sheal crops, oats, rye and mixed corn, generally fed
to cattle, has about doubled. Oats in particular are in favour for
cattle fodder; even before the turn of the present century oats
were not widely used for human food and oatcakes were made in
centuries been imported into the region. The turnip acreage has
halved over the past fifty years, perhaps the result of the gradual
disappearance of the horse, in strads that turnips were being
required to put good heart in to the land.

As the crofters' cropping policy has changed over the past half
century, so has their animal husbandry. Animals are a main self-
ing product, particularly cows and sheep. Horses, of course, have
been drastically reduced from their total of 1,872 in 1911, as
tractor, lorry and van have taken over their work. And though
some cattle are raised, the numbers are now about 60 per cent
below those of 1911. At that time the density of cattle per 1,000
acres was heavy (46-60) in the north-east of Lewis, less (31-45) in
the north-west, and still less further south. The present average
is around 18 beats per 1,000 acres. This decline, in particular
in the milk-yielding animals, has compelled Lewis to import
1,000 gallons of milk a day from the mainland.

It is sheep which today claim pride of place on the croft, which

BRICKS, PRINTING, WHISKY

396
800 tons and had a steam-driven winch. The ship has also 175 ●
vanished—except for the name of the Patent Slip Wood Mills, which produce Harris Tweed.

Other small industrial activities in the island during the nineteenth century included the business of Alexander MacPherson 204
chemist, druggist, stationer and printer, who set up in Stornoway in 1842. He brought across the Minch with him Lewis's first demy-size hand printing press, which was still in use on 1 January 1899 to produce the first issue of the school magazine *The Lewisman*. Copies of this earliest Lewis newspaper can be seen at Stornoway Public Library. Early in the 1890s Tiptman Nicolson also set up as a printer.

Whisky was once an important product, not only for local 273
consumption, but also for export. One of the Privy Councils 274 ●
main indicators against the islanders in the Hebrides in 1822 175 ●
was that they seized any cargo of wine and spent "hoth days and 137
nights in their course of drinking". The council therefore enacted that masters of vessels sailing Hebridean waters should carry no more wines. It has been suggested that this and other measures were responsible for the beginning of illicit distilling. Illicit distilling in Lewis continued overtly as late as 1827. One of the two principal stills established by Lord Seaforth in the island at that time was at Coll, a few miles from Stornoway, the other at Grimi, a few miles further on. Such was the fame of these stills, both for 136
output and quality, that it was hard to choose between "Coll or 137
Grim". Sometimes, the product passed as an article of exchange 138
in the island, and the factor received a considerable part of his 139
rents in it instead of money; but the stills were closed about 1830. 140
The Inverness Courier of 14 November 1827 remarks ironically: 141
"Owing to the vigilance of Captain Oliver, of the Revenue cutter 142
"Prince of Wales", and the new Excise Officers on shore, smuggling is completely put down in the Long Island that there is actually not a drop of illicit whisky to be got from the Butt of Lewis to Barra Head; and there is probably at this moment a larger supply of legal whisky from Greenock for the supply of Stornoway alone, than was ever imported into the Hebrides before."

The sixteen
was cultivating potatoes and his family were eating them
and so on. Some of the crofters who were only reluctant to adopt the new crops
were soon fitting. For the remainder it was a long time before they could
see the advantages of potatoes as a food crop for other parts of the kingdom. By
the nineteenth century, particularly of white fish, the proprietor had set up new directions
in supply and, in, in his agents, were probably the only buyers. Indeed John Ross, who
was factor to the Duke of Sutherland, was the first to introduce the curing of herring
in 1812 and other products. The absentee proprietor had been forced to
to have survived in Lewis until impending bankruptcy forced the sale of the estate in 1844.
Lewis was sold to James Matheson, who was a merchant in Canton, and who had
made his fortune and early acquired a considerable interest. Lewis made little of the opportunity.
Unlike Skye, the Long Island was of particularly good quality and commanded more than
the average price. Lewis was also fortunate in the quality of its proprietors. Skye was
not so good. The sons of the Skye, the hereditary aspirants of the partial agents
who have been inadequate to support the proprietors. In the remainder it is worth noting
the change in the current state held by each family since 1793 as shown in table 7.

Clearance and Congestion.

Even after the end of the transitions home in Ilsa, brought about throughout the
Highlands by the clearances, the population was still very substantial. In 1821, when the
population of the old parish was 7,000, the population of Ilsa was 2,000. Ilsa was
the only island in the old parish of Kilchoman. The population of Islay, however, was stronger.
Big industrial employment was not available in the Highlands. The former Islayman
Hugh Stevenson, in Glasgow, the latter involved the removal of some small tenants to
Islay, and the rest of the population of Islay was 7,000. The population of Islay
increased because of the employment and wage rate in the Lowland farms. Ilsa
of the formation of the earliest farms was not commenced nor are they precisely recorded.
Ilsa's population was 2,000 in 1821 and increased to 2,500 in 1831 and 3,000 in 1841.
Ilsa's population was 3,000 in 1841 and increased to 3,500 in 1851 and 4,000 in 1861
Czech Kong. About 1821 the small tenants of Machrins and Bruaich were displaced
Kong, and the farms of Machrins and Bruaich were added to the farm of Kong.
Machrins, about 1841 all small tenants were removed from Kong and Bruaich
being put into Bruaich. The remainder are said to have been sent to America.

In some cases, the proprietor was cleared about 1841, having been forced to substantial
cash some years earlier. Thereafter Kirkhouse formed part of the large farm of
Kilnaughton. Little Bruaich, too, formed part of the farm. On the mainland, agents
Stornoway, the factor, Mr. Ross, was a man of great ability and was well
Stornoway. In the early nineteenth century, and a barbarous was included at most
Kirkhouse. Further east the small tenantry were cleared from Conaibreing and
Glenhaven.

In 1824 in Islay shores were almost valuables to the proprietor (though removed to
Dublin) removed a vital necessity to the small subtenants, often working the same

28 434 South Uig and Park seem to suffer in the same way even though the larger producers, mostly mills, endeavour to distribute weaving equally to all districts. The weavers' earnings vary from individual to individual, according to the amount of work they get, and also from year to year according to the fortunes of the trade, especially of the American export trade. A good weaver, in a good year, might earn from £400 to £500 but an average weaver, in an average year in Bernera, probably earns between £250 and £300, whereas in the Carloway district (more accessible to producers based in Stornoway and Shawbost), the comparable figure is around £400. Most weavers try to maintain connections with several producers and this difference in earnings may be between those who obtain additional work for 'small-producers' (i.e. tweed merchants who do not spin their own yarn), and those who do not.

228 [226] 433 Fishing has greatly declined since the late nineteenth century (table 31), neither white fish nor herring are of any significance, nor do Bernera men contribute significantly to the island's economy by working on east coast boats, as was formerly the case. But Bernera has become one of the most important centres of Scottish lobster fishing, the value of landings having increased from £983 in 1937 to £4,949 in 1956. There are six locally owned lobster boats and others use the facilities at Kirkibost. The vessels generally have seven to a crew (c.f. the usual five in Sutherland) and work the whole length of the Atlantic coast and out to the Flannan Islands and St. Kilda. They carry 100 to 160 lobster pots and may also catch ling; crabs are almost entirely ignored because they are difficult to transport to the distant, mostly English, markets.

One very important factor in the present prosperity of the Bernera lobster fishing is the Kirkibost lobster pond. This was built by a local crofter in the 1920's. It was closed during the war, and was afterwards taken over by the Crofters' Supply Agency, though the original proprietor is still employed whole-time in looking after the pond and re-fishing the lobsters. There is naturally some loss of fish in the pond, and when high prices are being obtained at Oban the local fishers feel rather disgruntled at their less favourable market here. Hence, if there is a good catch, say over 2,000 lbs to a boat, and reasonably good weather prevails, the lobsters may be taken straight to Oban where up to twice the local price may be obtained. The C.S.A. pay 2s less per lb than Oban because of the cost of the upkeep of the pond, and the wages for two men with their boat. There was an experiment in flying lobsters direct from Lewis to Billingsgate, but the cost was too high. The problems of isolation here are very severe for the lobsters have to be sent by Macbrayne's steamer and by British Railways upon which there are no cold wagons reserved for the small quantities in question - a hazardous course for a highly perishable cargo.

Conclusions.

182 This part of Uig, therefore, has had a long and complex history of human settlement, exploitation, and adaptation. Much of the more recent part of this history is vividly remembered and still plays a part in the making of modern decisions. The sense of kinship and a common past is an important cement of society, for where natural resources are so limited a mystique of other than a material type is necessary if society is to retain 51 its self-respect. However, the natural resources are indeed so limited that economic [181] self-improvement is extremely difficult. The egalitarian tendencies of Gaelic society and crofting legislation are not now sufficient to resist the tendencies of the times and to prevent some of the crofters making adjustments in their holdings, but unfortunately there is insufficient good land to allow much adjustment without a drastic reduction of population [464] which would be equally damaging to the well-being of the local society. It seems unlikely that alternative sources of employment could easily be found - the isolation within Lewis, the isolation from markets of Lewis itself, and the lack of local resources have combined [288] on previous occasions to defeat plans for development. Weaving is the most important [228] means of supplementary livelihood, but it is too vulnerable to politics and fashion; fishing is greatly decayed from its former dominating position; only agriculture remains locally, and perhaps the greatest possibilities there lie in better standards of cultivation (especially drainage and fertilisation), a better standard of animal husbandry, and more reseeding. But whatever developments are undertaken will need careful selection and encouragement: results cannot be hurried but nevertheless something must be done soon if the local society is to maintain itself. This great and paradoxical element of the "crofting problem" is as important here as elsewhere in the seven "Crofting Counties".

175 dyeing the wool it was spread out, dried and sent to
283 Stornoway to be made into yarn. The yarn was then sent
175 back, and the weaver wove and washed it. About six women
286 were required to do the waulking (the process by which
[462] the cloth was washed and shrunk).

175 "In those days the weavers designed their own
286 patterns, and sold their own finished tweeds. I remember
432 going into town with my brother, we had two tweeds in the cart. We went into a shop to sell the tweed, and the man said it was poor weaving. He didn't want to pay the full price for it. I told my brother to roll it back up, we would take it somewhere else. As we left the shop, he told me I had 'good cheek.' In the next shop the merchant didn't say anything, and gave my brother the regular price. We went home with L60."

286 The great demand for tweed encouraged the development
288 of more efficient methods of production. One by one the
175 various processes of production were taken over by
178 specialists, and gradually these specialists were brought
[433] together under one roof. Large boilers for dyeing wool
[434] were supplied as a result of actions taken by the Congested
[463] Districts Board, which was formed in 1897. The Scottish
[386] Home Industries provided chemical dyes. The most
[236] difficult and time-consuming processes were carding and
[283] spinning, which small mills on the mainland began to do

286 on commission for weavers around the turn of the century.
288 By the early 1920's, four mills on the island were
175 carding and spinning wool on commission; and one mill
178 brought looms into its premises. Lord Leverhulme, who
[236] bought Lewis in 1918, saw the value of concentrating
[283] weavers in one place and of improving the technology.
He encouraged the introduction of Hattersley domestic
[463] looms, which eventually replaced the wooden looms. The individual weaver also did his own warping, but after World War II the mills began to hire warpers to work full time on mill premises. Transporting the tweeds, which used to be the responsibility of the weavers, is now the responsibility of the mills. Today all processes except the actual weaving are handled by mills, most of which are located in Stornoway.

Such steps in specialization and centralization made sense to the weaver. One of the older weavers recalls,
175 "In the late 20's or 30's you could buy a yard of Harris
286 Tweed for about two shillings. It wasn't economical for
288 any crofter to dye and spin the yarn, weave it and sell i
435 for only two shillings a yard. As the mills enlarged, they could make it with the machinery because they could make it an economic proposition."

175 However, the tendency toward specialization and
286 centralization was in direct conflict with the reasons

THE PEOPLE

771 press themselves in terms of religious values and ideas, the fear
783 of having committed unforgivable sin. The normal adjustments,
157 reflections and mental stocktaking of middle life are possibly more
[158] readily precipitated towards depression in an emotional people
733 prone to serious thought. This brings of course a concomitant
159 spectrum of problems in an area where in general a man is expected to take a dram and stand it; both nature and nurture are relevant factors. In the words of Cunningham Graham (1899), the medical adviser finds himself 'preaching teetotalism, that is for others, but himself taking his glass of whisky for the reasons which have been so cogently set forth by St Paul the Apostle to the Caledonians.' For those who comment in isolation on a com-
[539] munity's indulgence in alcohol, one must quote a Gaelic proverb: *'Tha smuideag fhein an ceann gach foid'*—Every peat-end has its own smoke.

733 From the earliest times the Western Isles have indeed been
+175 regarded as supporting a population with an uncanny predilec-
[539] tion for spiritous liquors. To a certain extent the spirits were needed by ill-nourished crofters to keep out the damp and cold when on the moors or at sea; and people in a depressed economic or mental condition will anywhere seek refuge in alcohol or other available drugs—forgetting the old Gaelic proverb 'Better the little fire that will warm than the great fire that will burn.' The evil effects of drinking have certainly at times been serious: in 1869 Sir James Matheson addressed a circular letter of remonstrance to his tenants, indicating that those guilty of misconduct were liable to be deprived of their holdings. In 1920 a vote was taken in Stornoway under the Scottish Temperance Act, with the result that the town went 'dry'; three years later the poll was upheld. Then in 1926, with a majority of 84, Stornoway went 'wet' again.

275 But the 'drink question' has been given undue prominence and
[733] dragged out of its island context. For instance, Stornoway contains all but three of the licensed premises on the island (at Tarbert, Rodel and Carloway) and, as the chief centre for business and pleasure, must naturally attract anyone seeking refreshment.

several agencies who have taken the task of bringing movies 178
to the remote crofters in the belief that the Highlander is 883
more likely to stay if he has a share in the life of the 177
Lowlander and the Englishman. These agencies want to "create" 52
a more adequate social organization."

Out of boredom, some young men try to add some spirit 273
to their lives by turning to "the drink." Although the 779
religion of the Skyeman is strikingly similar to that of the rural dweller in Wales, I found the Welshman and the Sgiathanach have quite different views on the subject of temperance.[26] All churches support temperance, from the pulpit and from the kirk collections, but abstinence or prohibition has never been accepted. Perhaps, their main reason for consistently rejecting the idea is their wont to base many of their decisions on Biblical directions. There can be nothing inherently wrong in the infallible Word of God. Then, too, to the Sgiathanach, whiskey is not Scotch; 273
it is the "water of life." The importance attached to the dram can be judged from its functions at birth, marriage, and death. It is also the means of thanking a man for doing a favor which cannot be repaid. Thus, while abstinence is a major religious tenet for the Welsh, temperance is the aim of the Skyeman.

The temperance movement has had an effect, all over 275
Scotland. The "pubs" are no more than a long bar set in a 185
bare room. Young men who have spent time in England, where the local "pub" is a closely knit club for the villagers, frequentl

[26] Rees, op. cit., p. 127

contrast the friendly and homely atmosphere of the English 275
"pub" with the austerity of the public bar on Skye. The same 185
man who went into the "Coach and Four" to play a game of darts and sing a few songs over his pint of beer goes down to the local hotel bar on Skye to toss off his dram, follow it with a pint of beer, and chaff his neighbors. "There is nothing else to do." Skye exiles in Glasgow, and not only 275
the youngest of them, often complain about the lack of 167
opportunity for social intercourse at home. What they really 571
mean is that "there is nothing else to do" unless they do not care about the reaction of their "people and friends." Moreover, they may want to return some day to stay, and, then, they will have to face the judgment of the old men in their neighborhood.

Another contrast of the Welsh and the Sgiathanach can 525
be found in their respective attitudes towards gambling. Traditionally, both enjoyed forms of recreation in which competition plays a major part, but the Welshman today does little gambling, implicitly because of his religious outlook.[27] The Sgiathanach, too, is not an open gambler, but the football pools find many interested individuals on the Misty Isle. There was, for example, the deacon in one church who forgot he 525
had a meeting to attend. Much to his dismay, when another 794
member of the kirk stopped by to see why he was late, he was busy filling out his football coupon. Dissimilarities, of 785
course, are not particularly significant. In both regions

even to the extent that the St Kildans used their observations of the flights of birds both as compass and as omen for good or evil. Martin speaks of the islands with amusement and admiration. He indicates that the community was backward in some ways: they were illiterate, and wondered naïvely at the newcomers and their manners. 'The inhabitants of St Kilda are much happier than the generality of mankind, as being the almost only people in the world who feel the sweetness of true liberty.'

In May 1877, when the local tourist trade had hardly started, HMS *Flirt* sailed from Greenock with food to relieve hardship among the St Kildans, and an officer of the Highland & Island Agricultural Society on board reported that 'Tobacco was what they invariably asked for'. The ordinary diet of the island consisted of, for breakfast, porridge and milk; for dinner, potatoes and the flesh of fulmar, or mutton and, occasionally, fish; for supper, porridge when meal was plentiful. Seabirds' eggs, from March onwards, also formed a staple food. Tea was taken once or twice a week and the islanders were reported to be 'rather fond of it'. There were eighteen inhabited houses, sixteen of which had zinc roofs, two being thatched huts. The sixteen new cottages had been erected about 1863, 'and are certainly much superior to the inhabitations of the same class of tenants anywhere in the Western Isles'. All were well furnished, peat was used for fuel and there were two watches and one clock on the island. There were some seventy-five islanders; most of the men were old, and only two of them were unmarried, with twelve spinsters still to choose from. All read the Gaelic Bible. The men were mostly tailors, shoemakers and weavers; every house had a loom. They made all their own clothing, the men also making the women's dresses, and a good deal of blanketing and tweed cloth was made and sold. Nearly every house had a spinning wheel and a large pot in which the yarn was dyed. The women were expert knitters. Each croft and house was rented at £2 annually, sheep being charged for at the rate of 9d per head; these charges were usually paid in kind.

Feathers of the sea fowl formed the principal export of the island. The factor paid 6s per stone of 24 lb for black feathers; and 5s per stone for grey. For these he received, in Edinburgh or

one night of the week in which controls are imposed, by the arrival of Sunday when no one is supposed to drink. The bothan was occasionally open on Friday night, and on Monday night. ("If there's anything left from Saturday night, we finish it on Monday.") During the summer of 1971 when the days were long and filled with communal township activities such as peat-cutting, the bothan was open every night of the week. The bothan closed when the man supplying it with drink suddenly died, and has not reopened.

2. Functions of Drinking: If a man decides not to participate in drinking, he is not praised for his self-control or his ability to abstain; rather, people say, "What's the matter with him that he doesn't mix?" A man goes off to the hotel or to a bothan "for a wee nip" or "for a pint" (the pint of beer which serves as a chaser for glasses of straight whiskey). Both phrases are euphemisms for the huge amount of whiskey and beer which must be consumed if a man is to satisfy the canons of social intercourse which obtain. A man can drink alone or, in the company of others, drink very little only at great social cost.

"You can't go in for a casual pint in a place like the bothan because it's a place where people mix, and you're bound to meet old friends you haven't seen for

and clothing, firing and shelter produced met local needs. Further questions of early economy belong to Part Two, as do those of the festivals by which the seasons were initiated and closed, along with the phases of human life.

A century later (as indicated in the lower graph), agricultural tasks were much the same, but the character of fishing had altered greatly. Herring fishing was at its height in the Island for some fifteen years, or half a generation, before 1914; but it never recovered from the difficulties of the war and after-war periods. The curves of the summer, autumn and winter fishing indicate the 'full-time' activity of summer, and the 'part-time' work of early winter. Not only the men, but the women participated, the women being employed in gutting and kippering. Boats and men fished further afield. Women were employed in gutting in early summer in the Scots East Coast fishing, which preceded that of the West Coast and was followed by the East Anglian autumn fishing. Some line-fishing continued locally in summer, but it has now almost ceased. The building and repair of roads increased after the middle of the century. The carting of peats, stacked by the roadsides, lessened 'creeling'; but it is particularly haulage by lorry which has replaced carrying by the creel, so lightening women's labour.

Indoors, primitive crafts tended to be superseded as machine-made articles replaced those of native material and manufacture; but the *ceilidh* ('*cailey*'), the meeting 'together', continued, though the arts of song and poetic improvisation declined. In Harris the women had woven and spun for centuries and have continued to do so for home use and sale; in Lewis the women gave up weaving in the last century, few spinning since then and none weaving. Thirty years ago only an occasional weaver, always a man, could be

found in a Lewis village; but in the ten to twenty years before 1939, the so-called 'Harris' tweed industry spread enormously in Lewis, accompanied by the construction of large spinning mills in Stornoway which supply yarn to male weavers. One further activity, kelp-making, was important for a time, although—not being strictly a traditional task—it is not represented in the upper graph, nor yet in the lower one, having declined after 1825 and disappeared (in the Island) long before the present century. Such was the annual rhythm of seasonal labour prevalent during the last generation, and a hundred years before.

7. *Rural Changes in Diet, Dress and Inter-marriage, and in Mobility: 1919–39*

Many outward changes occurred in the twenty years after the close of the First World War. Till the Island was able to benefit from the commercial advances of the mainland, it had no adequate relief from the famines of early times; in recent years the quantity of food has been rather more adequate. With the import of new foods, the consumption of vitamins at first declined: there was greater consumption of white bread from Glasgow and less of fresh vegetables (as ruined garden walls bear witness), and less, too, of cod-liver oil with the cessation of cod-fishing. Latterly, fenced gardens with vegetables and lettuce are providing vitamins, and fresh fruit (unobtainable even after 1919) is commonly on sale all the year round, so that a more rational dieting, when it can be afforded, is tending to recover lost ground and perhaps more.[1]

[1] E. P. Cathcart (*et al.*), *Studies in Nutrition: an Enquiry into the Diet of Families in the Highlands and Isles: III, Lewis* (Medical Research Council, Special Reports, Series 242. H.M.S.O.), London, 1940.

464 his little spare time. In addition there are a few croft holders with periodic employment. It is noteworthy that the incidence of employment bears no direct relationship to the size of croft holding - there is not, for example, a preponderance of holders of small crofts taking permanent employment.*

162 464 However, the croft holders are not the only source of labour: Appendix C(4) shows that there is a total force of fairly regular labour for the crofts amounting to 147, or rather less than half the total resident population. Of these, 78 undertake regular employment, 24 have employment on occasion, and thus only 45 are full-time, of whom 25 are over 65. The forms of employment are indicated on Appendix D(2); weaving, with 49 persons regularly involved, is by far the most important single source of full-time employment, the only other being fishing (24 persons). Estate work (mostly gamekeepers, ghillies, etc. at Grimersta Lodge) gives regular employment to ten persons in the townships of the Shore. No other form of employment accounts for more than three residents between 15 and 65 years of age; the category 'casual' covers a variety of unskilled labour and there are five non-employable invalids.

288 About 50 households, out of 130, have looms. Yarn is distributed by the Stornoway producers for weaving on commission; they collect, finish, and market the cloth. Hand spinning has all but died out and such yarn is more likely to be used for handknitting than for weaving; at least one lady supplements her income in this way. There is some evidence that Bernera weavers receive less work than those more accessible to Stornoway; the reason for this may lie partly in individual contacts between weavers and producers, and partly in the particular skills of particular weavers but transport is an important factor. Such a small isolated group of weavers does not justify frequent journeys by the Stornoway vans; in fact most yarn is put out, and tweeds collected, by a weekly carrier.

Table 31

Fishing in Bernera District 1892-1956

178 The number of cattle diminished as milk became
231 available by other means; and when the township reseeding
232 schemes came into existence, the need to go to the
176 shellings for an "early hire" was removed. The shillings
348 that remain in use today are huts of tin, wood and
concrete within easy walking distance from the highway,
used on weekends and during summer holidays. Most of
these modern shellings are close to Stornoway, and serve
as summer retreats for the relatively harried urban
dwellers much as pshlisses. On the west side, the
184 shellings are no longer used, but remain as a theme of
songs and in nostalgic memories.

C. The Loom

175 Clo Mor, the big cloth, was woven in the Highlands
• 284 and Islands for hundreds of years. Martin Martin,
who travelled through the Outer Hebrides in the late 17th
century, describes the export of "plaiding," and the
practice of washing or shrinking the woven length of
cloth (Martin 1716). Weaving was done on wooden looms,
and produced only for local markets until the middle of
the 19th century.

By the middle of the 19th century, the failure of
731 the kelp industry, decline of fishing, and destruction
736

• 285 of potato crops by blight had contributed to widespread
751 poverty. The production of cloth for non-local markets
752 was promoted initially by philanthropic proprietors in
176 an effort to ameliorate such conditions. Lady Dunmore,
497 of the Dunmore family that owned Harris during most of
the 19th century, was largely responsible for developing
a market in London and elsewhere for cloth woven in Harris.
346 The cloth was popular first among the aristocracy, who
wore it for hunting and other sporting occasions. The
435 romantic image of a cottage industry promoted for charitable
purposes contributed to the market value of the tweed.

The market expanded in the second half of the 19th
century, aided by ladies of leisure who followed the example
294 set by Lady Dunmore (cf. Hunter 1964: 24-26). The
441 production of cloth for a commercial market spread from
Harris to the southern isles, but was slow in coming to
364 Lewis, where the proprietor, Sir James Matheson, provided
the people with construction jobs. After Matheson died in
1876, weaving for outside markets began in Lewis in the
parish bordering Harris, and the name "Harris Tweed" was
used because a market for cloth of this name had already
been established. By World War I, weaving for outside
markets was being done in all four parishes in Lewis. In
1899 there were 55 looms in Lewis and over 200 in Harris.

• 284 By 1911, the number of looms in Lewis had increased to
751 250-300 (Hunter 1964: 43).
752 By the late 19th century small mills had replaced
736 domestic spinning and weaving in the Highlands on the
494 mainland. Weaving continued to be a home industry in
the Hebrides where it was encouraged by the support of
non-profit-making organizations such as the Highland
Home Industries and Arts Association, the Scottish Home
Industries Association, and the Crofters Agency--all
established at the end of the 19th century--and also
encouraged by local merchants who had begun to act as
middlemen in marketing the cloth. These merchants owned
small general stores throughout the island and either
bought the tweed from local weavers or gave them goods
from their stores in exchange. Many of the tweed firms
in Lewis grew from such small general stores to be
the barter system.

1. The Harris Tweed Industry in Shawbost: Coinneach

288 Rod, a man who started a tweed business on the west side
175 of Lewis which eventually developed into a large mill
167 with equipment for spinning yarn and finishing tweeds,
472 was said to have been a pick-taker, a man who took the
first £50 he borrowed, but borrowed another £50 and never
looked back, a man who throughout his life gave fellow

283 developed from the concentration of power in the hands
175 of the merchants. In the early days of the industry,
441 all the processes involved in the production of a
• 294 finished length of tweed were carried out by individual
441 families. A man used wool from his own flock, and with the
175 aid of other family members, dyed it with vegetable dyes,
348 carded and spun it by hand, wove it, washed and shrunk
it, and found his own buyer. Dyeing wool, spinning yarn,
and washing ("wauking") the finished length of tweed
294 was usually done by women. In Harris, the entire process
441 of producing a tweed was carried out by women, but in
462 Lewis the weaving was done largely by men.

A woman in her 80's recalls the process of weaving
175 when she was young. Hand-spinning had died out by this
236 time, although the question of whether tweeds woven with
such yarn could legitimately be called Harris Tweed was
not resolved until 1934.

"About 1916 or so it took about two weeks to a month
175 to do a tweed. You bought the wool from the Agricultural
167 Board. Sixteen bags of wool, costing about £20, would
433 do four tweeds. You needed four one-stone bags per
tweed. Then you would spend a day gathering a bag of
288 crotal (lichen scraped from rocks and used for dye). One
304 bag per one bag of wool was required for the dye. After

175 dyeing the wool it was spread out, dried and sent to
283 Stornoway to be made into yarn. The yarn was then sent
175 back, and the weaver wove and washed it. About six women
462 were required to do the washing (the process by which
the cloth was washed and shrunk).

175 "In those days the weavers designed their own
284 patterns, and sold their own finished tweeds. I remember
432 going into town with my brother, we had two tweeds in the
cart. We went into a shop to sell the tweed, and the man
said it was poor weaving. He didn't want to pay the full
price for it. I told my brother to roll it back up, we
would take it somewhere else. As we left the shop, he
told me I had 'good cheek.' In the next shop the merchant
didn't say anything, and gave my brother the regular
price. We went home with £60."

The great demand for tweed encouraged the development
288 of more efficient methods of production. One by one the
175 various processes of production were taken over by
specialists, and gradually these specialists were brought
433 together under one roof. Large boilers for dyeing wool
434 were supplied as a result of actions taken by the Congested
Districts Board, which was formed in 1897. The Scottish
288 Home Industries provided chemical dyes. The most
304 difficult and time-consuming processes were carding and
243 spinning, which small mills on the mainland began to do

• 285 on commission for weavers around the turn of the century.
751 By the early 1920's, four mills on the island were
752 carding and spinning wool on commission; and one mill
176 brought looms into its premises. Lord Leverhulme, who
497 bought Lewis in 1918, saw the value of concentrating
weavers in one place and of improving the technology.
He encouraged the introduction of Hattersley domestic
346 looms, which eventually replaced the wooden looms. The
individual weaver also did his own warping, but after
World War II the mills began to hire warpers to work full
time on mill premises. Transporting the tweeds, which
used to be the responsibility of the weavers, is now the
responsibility of the mills. Today all processes except
the actual weaving are handled by mills, most of which
are located in Stornoway.

Such steps in specialization and centralization made
sense to the weaver. One of the older weavers recalls,
288 "In the late 20's or 30's you could buy a yard of Harris
175 Tweed for about two shillings. It wasn't economical for
435 any crofter to dye and spin the yarn, weave it and sell it
for only two shillings a yard. As the mills enlarged,
they could make it with the machinery because they could
make it an economic proposition."

175 However, the tendency toward specialization and
284 centralization was in direct conflict with the reasons

175 behind the tweed's popularity. The tweed was more than
• 288 a cloth; it was peat smoke and windswept moorland, the
751 image of the free man who had escaped city life and
752 machines and was the master of his own destiny. Steps
had been taken all along the way to preserve the image
of home-crafted goods, as when, in an effort to prevent
machine-spinning, carding mills were built in Lewis and
Harris at the turn of the century to prevent wool from
being sent to mills on the mainland, where it was both
carded and spun. As early as 1906, a man was convicted
in London of selling power-loomed tweed under the name
288 "Harris Tweed." Today power-driven looms can produce
467 double-width cloth 54 inches wide, a width much preferred
to the 28-inch cloth produced on the Hattersley loom
because there is less waste when the cloth is cut. But
because "Harris Tweed" must be hand-woven, new looms of
light-weight metal are being designed on which double-
435 width cloth can be hand-woven. The new looms will cost
so much that many weavers say they would be unlikely to
invest in them, especially given the uncertain future of
the industry.

The Harris Tweed Association, formed in 1909, was
175 granted a certification mark by the Board of Trade which
167 was stamped on tweeds that were hand-spun and hand-woven
433 in the islands. During World War I, hand-spinning died
434 288

175 out in Lewis, and the Harris Tweed Association was
167 ineffective in enforcing its standards. In 1934,
• 294 weavers were allowed to use yarn spun in island mills,
441 and production increased; but no weaving was allowed
to be done in the mills. All looms were removed from
those mills which had tried to centralize this stage
of production. The actual process of weaving remained,
by legal definition, decentralized, although the word
"crofter" was changed to "islander," thus widening the
category of persons who could weave "Harris Tweed," and
paving the way for centralization of weavers in the town
of Stornoway.

Any person can purchase his own yarn, weave his own
288 tweeds, and sell them to tailors or summer tourists;
467 but before a weaver can weave for the mills, he must be
registered with the Weavers Union. The Weavers Union is
a branch of the Transport and General Workers Union,
which includes mill employees, hospital workers, lorry
drivers, and others. It is an anomaly of the Harris
Tweed industry that workers classed as self-employed
should join a union of employees and is another indication
of the centralization of control and power in the mills,
with whom the weavers, along with the mill workers, bargain
for higher wages. Weavers receive a basic sum of over
288 £10 for each length of tweed, which is usually 38 weaver's
462
804

Questions about the state of
288 "the tweed" permeate all discussions, and often
175 constitute an initial greeting. "Have you got a
167 tweed in the loom? How many do you have? Did you
• 294 see Stirling's tweed van going into Paire? Did you
441 hear that Rewalls has an order for about 800 pieces...?"

"The mills brought us two tweeds, and I got two
in town myself. I stuck those two in the attic so
that anyone who came in would be none the wiser," says
one person in a whisper. Neighbors are in and out of
each others' houses and homesheds, observant and
questioning, on the lookout for any indication that
they have missed out on some transaction in the
competition for scarce goods.

D. Weaving as Strategy

When weaving was done on a wooden hand loom, the
weaver required a longer period of apprenticeship.
Weaving was "more of an art," as some of the older
weavers remember it today. Not only was the shuttle
thrown back and forth by hand, but the lifting of
different threads in the warp was done by manipulating
four foot pedals in the correct order. Today, the
288 process of weaving is very much simplified: the weaver
467 pushes only two foot pedals, and simply keeps an eye on

the automatic shuttle; all other processes have been built into the design of the Universal Loom (cf. Thomson 1969). In other words, weaving does not entail very specialized skills and is not difficult to learn. A neither man nor woman need be a loom-tender for a short period of time, or pick up the trade again with ease after having been absent from the loom for a long time. Religious scruples have not been known to operate in this if a tweed is "urgent." Wives help their husbands, and young boys their fathers and uncles. Such low-level specialization and substitutability are complementary to crofting activities and the maintenance of neighbourhood ties, and may be seen to favor continuance of the occupation of weaving.

The Lews Castle College in Stornoway, established in a cattle-fattening shed in 1953 in a building that had formerly the home of Sir James Matheson, offers training courses in weaving for skills which can for the weaver and qualify a person for membership in the Weavers Union (cf. Stornoway Gazette, March 16, 1968). The College also offers evening weaving classes for all the public schools on the island to instruct young boys in the rudiments of weaving. The Highlands and Islands Development Board have in the past made loans and grants with which to purchase looms, and government aid has protected the sills.

Despite these aids and incentives, persons do not commonly their children to weave. The weavers themselves describe the job as dull, offering no security and no prestige (cf. Thompson 1969).

Referring to her own weaving, a middle age, "By the time he's old enough to ...ave, the tweeds will have failed." another another says, "I want him to learn some trade, if he's intelligent enough. I don't want him to stay here. The tweed is so uncertain." "There's no future in it," says the father of another young boy, "I definitely don't want this lad to be a weaver. It would be good if he went in for engineering."

The history of the weavers reveal many examples of shifting occupations, having little attachment to the work in the local mill, which is also relatively unspecialized. The Shawbost mill most resembles a cottage industry in the latter in that it has no fixed hours. Women come to weave for shifts which last for two weeks and qualify a person for membership in the Weavers Union (cf. Stornoway Gazette, March 16, 1968). The weavers in such cases are substitutes for all the public schools on the island to instruct young boys in the rudiments of weaving. The Highlands and Islands Development Board have in the past made loans and grants with which to purchase looms, and government aid has protected the sills.

AGRICULTURE AND FISHING

and in neighbourhood becoming the centre of the growing township. In 1901, the Lewis Estate commissioned the *Old Statistical Account of Scotland* indicated that upwards of 183 boats were employed in fishing in the parish of Barvas. In 1951 no such statistics were recorded, showing that the fishing industry was presumed with the decline of herring fishing. At the present time, a few dozen crofters and their sons fish in the summer season. The women do not fish; but almost at all times when their time is occasion to go to sea, they never decline that service, and row powerfully." In the parish of Barvas, there are approximately 1,000 Scotch pairs of oars and 50 were taken each year from dog-fish livers and sold to Stornoway merchants at from 40 to 50 shillings the gallon. It is related that the tenants of Ness were able for a long time to pay their rents with dog-fish livers. Cod and ling were also caught fish caught by the men of Lochs, an annual average of 24 tons being cured and sold. Herring, however, was the chief fish which were consumed locally.

Loch Roag on the west of Lewis proved to be about the best fishing ground; in 1794 about 90 and from all parts of the United Kingdom. Herring fishing, however, in the Loch Roag-cured herring was exported exclusively to Sweden. The Secretary of Stornoway, Mackenzie, in the *Old Statistical Account*, gives figures showing the quantities of fish shipped from the port from 1792 to 1794. Thus in the year 1793 there were 14,000 barrels of herring were exported to the Continent, and 20,000 were for consumption in the Mediterranean. In the year 1794 there were distributed for Continental markets. Herring, cod, and ling were then pursued during the following years with growing vigour, though the inshore white fish took favour. The herring fishing did not make great strides, however, and in the twenty years, where at the beginning of the twentieth century catches were confined to the inland sea locks; the price for the herring was not much to compete with foreign fishing, and their boats and nets were not suitable for it.

Herring fishing, which had begun in Loch Leven in 1844, he gave scant attention to the potential in the fishings round his island. Though he expressed the hope that there would be a regular steamer communication between the mainland and the island, and spent over £2,000 in building a quay at Stornoway

6 TRADE AND INDUSTRY

In the earlier times, the folk of the island of Harris and Lewis lived a simple existence. Their way of life as it was lived in their own days was available at near hand; where the economy was self-contained, the economy virtually self-sufficient. By and large, the only commodities often imported were salt, iron, and, to a certain extent, wood. Rents were paid largely in kind: the produce of agriculture, fishing and labour. Surplus produce was disposed to southern merchants for a fixed sum of shillings per boll, for which there was really very little need in the island. But once money became important in the economy, the fishing folk had to so be the crofters in the population, though as discussed in Chapter 3 this is well before the crofters became the majority. The island economy had never been organized on a wood foundation, with the result that wooden ploughs were used in the Outer Hebrides as late as 1840, but when, shipwrecks, tenantcies, kelp-burning and the sale of the estate of Lewis, the island economy was forced to seek some stability, either individually or in shares, and also had water rights in the common ground of the township in which he lived.

CROFTER INDUSTRIES

From the crofter cotton class tenant emerged the crofter-craftsmen. In Lochs, for instance, by the turn of the seventeenth century 60 kelp pot cone were registered as fishers and remunerers. In the west, in the parish of Barvas, some 70 per cent were also fishers, with kelp-making as a secondary occupation. Kelp-burning, which at the seventeenth century catches were confined to the inland sea locks; the price for the kelp was not much to compete with foreign fishing, and their boats and nets were not suitable for it.

Herring fishing, which had begun in Loch Leven in 1844, he gave scant attention to the potential in the fishings round his island. Though he expressed the hope that there would be a regular steamer communication between the mainland and the island, and spent over £2,000 in building a quay at Stornoway

TRADE AND INDUSTRY

EIGHTEENTH-CENTURY TRADE

but their negligence even in its article appears from their sending 93 barrels of herring to Stornoway, and 20 barrels to Continental markets. Lewis was rated at 4,000. Exports were some 100 tons of kelp, 140 tons of herring, 50 tons of cod and ling, 50 tons of salmon, 50 tons of wool, and £445. Small quantities of cheese, wool, and dogs of sheep, oxen and sale were also exported, and considerable quantity of valuable foodstuff. However, the spread of distillation as a legitimate house industry by which the surplus of peat, in kind or by sale, was followed by legislation prohibiting all but very large stills. Distillation, however, continued to be a cottage industry.

It was, then, by a very narrow margin that subsistence was won from the island economy, and the people had to pull together to the point by a ton of ...ness. Beside kelp, there is little else more significant in the island economy, which still could be of use to the ...ing, which they send yearly to Glasgow. They raise a little flax, and spin and weave some coarse linen for household use. The island economy had never been organized on a wood foundation, with the result that wooden ploughs were used in the Outer Hebrides as late as 1840, but when, shipwrecks, tenantcies, kelp-burning and the sale of the estate of Lewis, the island economy was forced to seek some stability, either individually or in shares, and also had water rights in the common ground of the township in which he lived.

TRADE AND INDUSTRY

found in a warehouse in Leith some years ago; a few found their way back to Stornoway, where one can be seen in the Public Library.

HARRIS TWEED

Today, with kelp long forgotten, the product of minor importance, is the Harris Tweed industry which supports many of the island people, either directly or indirectly, and brings foreign industry with exports earnings exceeding £2,500,000 a year. Harris Tweed is exported to many countries, including Australia, Canada, Australia, New Zealand, Japan and all the European nations. Some 80 per cent of the Harris Tweed is made in the home, both dependent upon and supporting the crofter-weaver working at home. Harris Tweed is a fabric which still retains the feel of wool woven annually by the independent weavers 'on the looks' of the island. Lewis took to the manufacture of tweed, supplying their own looms and hobbies, equipping and maintaining their workshops. Tweed was woven in the Outer Hebrides as far back as 1840, but when, they are graded as self-employed persons and as such are not the part of the Stornoway Gazette, March 16, 1968). Lewis tweed much argument.

One of the most outstanding facts about the cloth is that its essential quality have remained unchanged since the industry's early formation years. Harris Tweed is known as the Patent Ship (one of Madtown's enterprises) in Stornoway. Non-profiteering bodies like Scottish Tweed Ltd. (the Stornoway Branch of the Crofters' Agency) began to open up more depots for the receipt of tweeds. In addition to the original depots at Stornoway and Tarbert, others were established at Obbe (now Leverburgh), Uig in Lewis, and at Lochs and Shawbost.

The Congested Districts Board also took an interest, appointing a commissioner to report on the possibilities for the introduction of better cloth designs and other improvements including the Harris tweed. This latter, with a distinct individuality, was not produced used on the 'heart loing' (the traditional small wooden hand, where the tweed was woven in a square of fabric. Little of it, the heard also paid grants for the improvement of looms, and large black pots were sent to Uig to enable the people there to

TRADE AND INDUSTRY

in the eyes of the more sophisticated purchasers, as did the domestic and primitive conditions of its manufacture. All processes were carried out in the home. The wool was washed and dyed out of doors beside any convenient stream where a big black pot could be set up on some stones and the pots furnished with Gartlie, a tedious and unpleasant task, spinning and weaving were done in the home, the cloth, after being woven, was taken clamoyre or proper, to the nearest wool-scoured mill, or to another man who has a definite 'peat' for the purpose. The Harris industry of the Lewis crofters, as the industry is known, including Australia, Canada, Australia, New Zealand, Japan and all the European nations. Some 80 per cent of the Harris Tweed is made in the home, both dependent upon and supporting the crofter-weaver working at home. dye larger batches of wool to maintain uniformity of colour through the whole web.

Lewis tweed

Suddenly Lewis came on the Harris Tweed scene. It was fortunate that it was about this time, that its employment was on work related to public health and to the reconstructions of the Matheson regime. Fabing, too, yielded a remarkable tweed. The Trust Association was formed, consisting of representatives of each of the Harris merchants, the Crofters Agency and the Scottish Home Industries Association (which the Board had formed in 1911). In 1912, some Stornoway merchants were granted representation in the Harris Tweed Association, which still exists for the benefit of the industry.

In 1914, the definition of 'Harris Tweed' was eased to include any cloth 'made from pure virgin wool, produced in Scotland, spun, dyed and finished in the Outer Hebrides' and hand-woven by the Islanders at their own looms in the islands of Lewis, Harris, North Uist, Benbecula, South Uist and Barra. To get round this, Sir Samuel Scott, the proprietor of Harris in 1906, opened a water-powered mill at Tarbert in 1909. In 1909, this mill was the Tweed' a cloth woven on a power loom.

As the number of weavers had increased, so did the demand for yarn even further outpace the capacity of the domestic spinning wheels. Fabing and Lochs had established mills and added to inferior weaving, gave rise to the name 'Stornoway Tweed', which, however, was not to be confused with the Harris industries Association closed its Stornoway depot because the demand was so great that it was left to the Harris Tweed Association's reliance. The Crofters Agency, however, kept open its depots at Balallan and Tarbert. The Harris Tweed Association, however, was on the market with the same name: a 100 per cent true handmade product actually was arranged. Madtown's name is spun yarn. In Stornoway it was appreciated that the use of mill-spun yarn, the development of a power-loom tweed, and the introduction of better cloth designs, and other improvements including the Harris tweed. This latter, with a distinct individuality, was not produced used on the 'heart loing' (the traditional small wooden hand, where the tweed was woven in a square of fabric. Little of it, the heard also paid grants for the improvement of looms, and large black pots were sent to Uig to enable the people there to

THE TRADE MARK

nary. In the end, an application was made in 1909 to that body for a trade mark defining Harris Tweed as 'tweed, handspun, handwoven and dyed and finished by hand in the Outer Hebrides', with 'made in Harris' or 'made in Lewis' added as appropriate. The Trade Mark was granted in the following year. Cutting, a tedious and unpleasant task, spinning and weaving were done in the home, the cloth, after being woven, was taken clamoyre or proper, to the nearest wool-scoured mill, or to another man who has a definite 'peat' for the purpose. Table V

Shawbost:

Proportion of Male Weavers

182 on the East Coast and in Orkney and Zetland there are
226 comparatively well-marked seasons at which the herring can be expected, Stornoway appears to lie marginally to their main migrations. Thus the amount of the catch varies and curers have been disinclined to set up large curing stations such as those which deal with the enormous influx at the height of the season on the East Coast. A partial compensation is found in the continuance of herring fishing in winter.

226 While fishing from rowing boats for saith, lythe and
[178] mackerel still supplies food for home in summer, fishing with long lines in winter and spring brought cod and other white fish, sun-dried and salted, which became an important export though declining sharply after 1900 and of no importance since 1919. Lobster fishing is undertaken in small boats with two or three men from many townships, and two ponds have been reopened, one on Bernera, Lewis, and the other at Stockinish in Harris to store the lobsters. Conditions in 1935 and 1951–53 are compared in Appendix I (iii) and II (iii).

6. *The Annual Rhythm of Life*

221 It is appropriate here to show how fishing and crofting fitted together into the seasonal calendar a hundred years ago, and shortly before and after the war of 1914–18.
[182] The Lewisman's year shows its relationship to the seasons,
[175] with their temperature, rainfall and wind (Fig. 9). A
[178] century wrought changes: cod fishing declined as the herring fishing grew in importance; but the latter fell
• [286] away again after the war. Partly as a result, weaving has become important, the men fitting into the idle periods between the brief peaks of spring and harvest work.

461 Men's work can be roughly estimated as either light,
462

NEXT CONTINUED ON PAGE 22

462 calve. For peat-cutting, the men took advantage of the
221 driest months, with a peak in May–June; and after the peat stacked on the moor had dried through the midsummer
175 months, the women set out to creel it in, before the autumn rain should have made the bogs too soft, and stacked it near their doors. The fishing season usually closed with some herring fishing in August–September. The clipping, or rather pulling off, of the wool as it began to be shed, was done chiefly by men, in July–August. Then, too, the absence of fences made herding doubly necessary to protect the growing crops.

Some relief was given by the departure of many of the cattle to the shielings, where a few girls and women would stay through July and August, once men and women together had driven the cattle there. Cows kept at home were, and still are, tethered, or herded close at hand.
[178] Even now the hay harvest is insignificant, and until this century it hardly existed, except for a little put by in a
221 tiny barn. Towards the end of the summer, roofs were
175 stripped of their thin thatch, and fresh turf was laid on the light rafters and covered with barley straw. Then as now, harvest came in September–October, all helping in reaping the oats with the scythe or the sickle, and pulling up the barley by the root. With the onset of winter winds, rain and cold, the chief outdoor tasks of the year were over.

Throughout the year there were small jobs to be done, and in the past, owing to the imperfection of implements,
[462] constant small repairs were necessary. Indoors in winter the women prepared the wool together and wove it.
• [286] Baskets were also made then, the coarser types by men. By all these means the essentials of subsistence were largely met, so long as the seasons were reasonably good. Except for salt for the housewife and iron for the smith, the food

221 and clothing, firing and shelter produced met local needs.
175 Further questions of early economy belong to Part Two, as do those of the festivals by which the seasons were initiated and closed, along with the phases of human life.

221 A century later (as indicated in the lower graph), agri-
[178] cultural tasks were much the same, but the character of fishing had altered greatly. Herring fishing was at its
[433] height in the Island for some fifteen years, or half a generation, before 1914; but it never recovered from the difficulties of the war and after-war periods. The curves of the summer, autumn and winter fishing indicate the 'full-time' activity of summer, and the 'part-time' work of
[462] early winter. Not only the men, but the women participated, the women being employed in gutting and kippering. Boats and men fished further afield. Women were employed in gutting in early summer in the Scots East Coast fishing, which preceded that of the West Coast and was followed by the East Anglian autumn fishing. Some line-fishing continued locally in summer, but it has now almost ceased. The building and repair of roads increased after the middle of the century. The carting of peats, stacked by the roadsides, lessened 'creeling'; but it is particularly haulage by lorry which has replaced carrying by the creel, so lightening women's labour.

Indoors, primitive crafts tended to be superseded as
[178] machine-made articles replaced those of native material
[571] and manufacture; but the *ceilidh* ('*cailey*'), the meeting 'together', continued, though the arts of song and poetic
462 improvisation declined. In Harris the women had woven and spun for centuries and have continued to do so for home
283 use and sale; in Lewis the women gave up weaving in the last
• 286 century, few spinning since then and none weaving. Thirty
178 years ago only an occasional weaver, always a man, could be

178 found in a Lewis village; but in the ten to twenty years
462 before 1939, the so-called 'Harris' tweed industry spread
283 enormously in Lewis, accompanied by the construction of
286 large spinning mills in Stornoway which supply yarn to male weavers. One further activity, kelp-making, was
221 important for a time, although—not being strictly a
824 traditional task—it is not represented in the upper graph,
178 nor yet in the lower one, having declined after 1825 and disappeared (in the Island) long before the present century. Such was the annual rhythm of seasonal labour prevalent during the last generation, and a hundred years before.

7. *Rural Changes in Diet, Dress and Inter-marriage, and in Mobility: 1919–39*

178 Many outward changes occurred in the twenty years
262 after the close of the First World War. Till the Island was able to benefit from the commercial advances of the
146 mainland, it had no adequate relief from the famines of early times; in recent years the quantity of food has been
[177] rather more adequate. With the import of new foods, the consumption of vitamins at first declined: there was greater consumption of white bread from Glasgow and less of fresh vegetables (as ruined garden walls bear witness), and less, too, of cod-liver oil with the cessation of cod-
[244] fishing. Latterly, fenced gardens with vegetables and lettuce are providing vitamins, and fresh fruit (unobtainable even after 1919) is commonly on sale all the year round, so that a more rational dieting, when it can be afforded, is tending to recover lost ground and perhaps more.[1]

[1] E. P. Cathcart (*et al.*), *Studies in Nutrition: an Enquiry into the Diet of Families in the Highlands and Isles: III, Lewis* (Medical Research Council, Special Reports, Series 242. H.M.S.O.), London, 1940.

162 weaving and fishing, the fall in population would probably
[167] be small, if any, in 1941. This fall in the total figure was not so much a decrease in the number of families as in the
[168] number per family. The Island was only then following the restriction of population begun half a century before in the rest of Protestant Britain, though the causes, social and economic, are very dissimilar. Actually, little did occur to change either the rural situation or that of Stornoway, until the outbreak of war in 1939.

162 Since 1931 there had been no real decrease: Lewis is
178 a land of house-building, not of ruin and abandonment; of increase of holdings, not diminution, and even of agri-
369 cultural improvement. No doubt 'artificial' causes were
[657] at work: first, loans, grants and unemployment insurance and assistance—once known as 'the dole'—and, secondly,
[593] the money sent to elderly parents and dependants at home
[888] by young folk in Glasgow or abroad, or savings brought back by the young people themselves. Yet there is some
[226] fishing and agriculture still. Above all, 'hand-weaving'
[241] has grown, even if this be partly 'artificial'. Recently it was not only the elders who had returned to the Island, but
[286] men and women in the prime of life, so that the question of resources, livelihood and population in Lewis needs to be re-examined afresh.

167 The emigration which took place from 1949 to 1951
[464] followed directly upon the losses and the unemployment in the Island's Harris tweed industry. This crisis resulted
[651] from the imposition in 1949 of a Purchase Tax on hand-
[162] woven Harris tweed of 666 per cent. If the tax had been maintained and no adequate adjustment made, the effects on population would have been far-reaching.

175 couple advancing one on either side of it—many other
476 tasks were definitely team-work. Such was peat-cutting. "When they are making peats, five people are employed.
175 One cuts the peat, another places it on the brink of the
476 ditch where it is dug; a third spreads it on the field, a
314 fourth pares and cleans the moss; and a fifth man is resting, ready to relieve the man that cuts. The women are seldom
[462] at this work, but the men help one another alternately; sometimes they must rest satisfied with fewer hands; but the above is the full complement of men required to per-
[127] form the work, according to their tastes." Buchanan's description was written 160 years ago (1793); it remained
[178] true till recently and generally it is so still. There was thus a normal team practice for work—even a man to rest was not
[538] forgotten! As the Gaelic proverb puts it: "They won't make power (add strength) without a threesome and they'll limp without a foursome!" (*Cha deanar treine gun triuir,*
[802] *'s bidh iad crubach gun cheathrar*). In Gaelic, as in Scots, one speaks of a team according to its number, as "a pair, a threesome, foursome" and so on, up to a tensome (*deichnear*). In Lewis the farm-team was usually a foursome or fivesome.

175 Only in exceptional cases was land worked and held
423 singly—as when a smith was kept busy at his anvil in ploughing-time and harvest. Thus in 1715 one or two
241 rural smiths had single holdings of average value or more
[324] (£1), and one artificer or tin-smith (caird) a holding of minimum value (5s.); and in the burgh all the small plots
[286] were held singly. As the women wove, at home mostly,
[462] no male rural weaver held a single plot; his weaving could be done at slack times, so long as there was light; at busy times he worked on the land with the rest of his team.

000 On the mainland, both Lowland and Highland, an

788 (in Gaelic) by a housewife in a Catholic isle, as our friend-
592 ship matured. It had been said nightly at her fire by her
354 father-in-law until his death (not long before), which had
539 come after that of his wife. "I smoo'r the fire tonight, As Mary's Son smoo'red. Be it well with house and fire; Be it well with all our household. Who are on this floor? Peter and Paul. Who are on watch tonight? Light-white Mary and her Son. Thus God's voice taught, And the Angel spoke: The Angel at my house door, Until the clear day come tomorrow. Amen." As this variant shows, memory still lives in the Isles.[1]

788 In these runes, the key to the words "as Mary's Son
593 and as Mary did, in their day" is the example of filial duty,
776 of wifely and motherly care. In spite of lapses to 'Mario-
[779] latry' during periods of decadence in the Roman Church, the virtual banishment of Christ's mother from Protestantism has led to a loss deeper than Presbyterian Scotland has yet realised. Her name was a daily reminder, both of a woman's part in the spiritual life of the home, and of a son's self-discipline and affection: in a word, of mutual love.

788 For wool, the sheep were blessed, as in the "Clipping
[236] Blessing". There were blessings of the loom and of
[286] warping and weaving; and after neighbourly fulling or 'waulking' of the finished web, came its consecration.
[461] As the work was solitary and communal in turn, so the prayer. Carmichael's own fine prose translations should be
[127] studied (*Carmina*, vol. i, Nos. 108-113; cf. vol. iv, pp.
[538] 88-99). Yet, those being available, we quote rhythmic

[113] [1] Cf. Rev. Allan Macdonald, *Cómh-chruinneachadh*, p. 107; *Carmina* (Nos. 84-87, 324-326); and M. Kennedy-Fraser, *Songs of the Hebrides*, vol. ii, p. 31. Sacred lore is not to be picked up lightly by a stranger. It was only upon the second of my prolonged stays under her hospitable roof that this good woman would admit and impart her knowledge, treasured in the secret places of her heart.

788 CH. VII SPIRITUAL LIFE OF COMMUNITY

538 versions to suggest the significant poetic form of the original.

788 "The Clipping Blessing", being addressed to creatures,
236 is simple in thought and form, and its opening may be rendered:

O come back woolly, though now you're shorn,
By May, may each a lamb have borne,
May lovely Bride you endow,
And Mary fair sustain you now!

[825] It goes on to beg protection from wolf and bear, as well
[538] as fox, hoodie crow and eagle, and closes with the opening couplet.

236 From start to finish the work must be true. The wool
461 is from the sheep they reared—it is not got by 'thigging', as a landlord takes 'gifts' from poor tenants; the yarn is sound with no odds of thread from worn-out cloth; the web is their very own, not the clergyman's due (*Carmina*,
• 286 110, 113, 109). Only so can the goodwife's web be beauti-
788 ful, and blest. "Thrums nor odds of thread, my hand never kept nor shall keep. Every hue in the bow-of-the-
[539] shower has gone through my fingers beneath the cross."
[593] The weaver, with her household cares and her bairns about her, to be clear in mind must be calm in heart as, thread by
[796] thread, she prepares her warp. To start, she chooses Saint Columba's Day.

[534] Thursday of blessings
For warping and waulking,
Thrice fifty strands
To number . . .

Ward away the evil eye!
Or evil will, or aught awry,
Consecrate, O Lord on High,
My Loom . . .

• 286 Make smooth and even the warp of my loom
788 And grant thy blessing, God, on me,
539 On all who here find shelter and room
And dwelling . . .

Thine arm be round each woman here
Who waulks this web of mine,
O aid her in her hour of need . . .

Keep the flock that we may win
Sweet and nourishing milk to drink
And wool to give, to weans and kin,
For wear!

Even now in Harris or the Lews, a brief good wish may be uttered—a "Health and strength to the wearers!" as the perspiring women end the waulking; but in the past the web was finally consecrated. Each of the family who was to wear a portion of it was named by the weaver herself, who led the consecration (*Carmina*, No. 113).

May the well-loved wearer of my web
Never be wounded . . .
May the sanctuary shield of the Lord be his. . . .

286 The significance of this gift of hard-won cloth can now
532 be seen, first for the family but next for the neighbourly
614 team. We can understand how each 'set' or pattern of tartan stood for the spirit of the family and the group of
[593] kin and homeland, the clan. We conceive what it meant
[621] to the Gael when the tartan, with "the Highland dress . . . or any part of it whatsoever", was forbidden "to
[291] any man or boy" in the Highlands. Women were still allowed to wear it, it was true, but the dress ceased to be a symbol of community when its wear was confined to
[714] one sex. As a single exception, the Highland dress was
[175] retained for soldiers, but the militarisation of the tartan—though it seized upon one strand of clanship, that of

warfare—destroyed its intimate tie with the home, with peace. The web the women had dyed, spun, woven and waulked together ceased to be a sacrament when the tartan was proscribed to men except when worn as a uniform with "England's cruel red".

The framers of this law, which stood on the statute book for over forty years, took full cognisance of what they did. Appended to the Act of 1747 was an oath which reversed every benediction said by the women at their work: "I . . . do swear, as I shall answer to God at the great day of judgment, I have not, nor shall have, any gun, sword, pistol or arm whatever, and never use tartan, plaid or any part of the Highland garb; and if I do, may I be cursed in my undertaking, family and property—may I never see my wife and children, father, mother, relations—may I be killed in battle as a coward and be without Christian burial in a strange land, far from the graves of my forebears and kindred; may this come across me if I break my oath". This Act, as law and symbol, struck full at the sacramental life of family, neighbour-team and clan community, in which labour and prayer had been indissolubly bound.[1]

(c) WORSHIP, CONGREGATIONAL AND PERSONAL: THE BOOK AND THE WORD

Little remains of the tradition of worship in the tiny oratories, chapels or 'temples' whose ruins stud the shores

[1] The collaboration of friends in Lewis may allow mention of the Gaelic version of A. Geddes, *The Spirit of the Tartan, a Song Drama* (English Version); *Souvenir Programme and Book of Songs* (Outlook Tower, Edinburgh, 1932). In this the spirit of this labour sequence embodied in its songs and runes is dramatised in its setting of custom and history. The Gaelic version was prepared by the generous labours of James Thomson, M.A., Bayble, and the late Duncan Macdonald, M.A., Sandwick, Lewis.

as some Indian pedlar one meets on the road may seem now. An older packman's tale of his long tramps, of the people's poverty and hospitality, must have resembled the mingled plaints and praise one hears from an Indian pedlar today! But in the past only a speaker of Gaelic could find his way among the people. Almost until 1900, if not still later, Gaelic speech was to prove a social bond, but ignorance of English speech an economic barrier.

The transition to increased exchange, with migration, permanent and temporary, tended to make for specialisation. About 1795, *Statistical Accounts* enumerated, for every hundred families, two or three smiths, wrights (or carpenters), a shipwright or some boat-makers, a few weavers, tailors, and perhaps a miller. Each of these held some corn land, individually or in shares, with rights on the common. The line between plain crofters (to use a later term) and crofter-craftsmen was not easily drawn, and different writers wrote as they judged best. In Lochs, 80 per cent were fishers and net-makers. On the open shores of the west, in Barvas parish (in which three-fourths of the men were also 'fishers'), kelp-making was a seasonal occupation. In Stornoway parish, where sub-tenants paid 30s. to 60s. in rent, with twelve days' service, they sold ling to their tacksmen at 5d. each, earned £1 a month on herring boats, made kelp at 30s. per ton, and roads at 8d. a day.

In Harris in 1795 the eight 'bred' (or trained male) weavers worked only for 'the gentry': the laird, the tacksmen and their families. The rest of the weaving was done by the women, giving a ratio of only one male weaver to fifty-five families. But in Lewis male weavers were commoner—one to every twenty to thirty families was the ratio—as if the practice of home weaving by the women was less universal there, even at that date.

left the Island. Yet after 1931 many returned, owing to losses and unemployment both in British towns and overseas. When emigrants began to come home the 'Harris' tweed industry had spread to Lewis and offered increasing employment. Some men still fished in family-owned Island boats, and others as paid hands (on boats from the East Coast), though losses and unemployment were suffered.

Inter-war changes were hastened not only by movement beyond the Island—an influence at work for three or four generations before—but by mobility within it. In 1919 a small mail car made its way daily from Stornoway along each of the five main roads, with an occasional passenger. When crofters crossed the Island to Stornoway they went on foot or took the pony and cart at a slow walk: it was a day's journey. Ten years later, Ford vans, bought second-hand, ran daily to Stornoway from every township. Frequency, ease and relative cheapness of movement came late in an Island with no railway: the mobility of the motor for marketing and shopping brought rapid change.

'Hand-loom' weaving had become an important, if precarious, resource, important because of the capital invested and the labour employed, yet precarious because of its dependence upon name and sentiment, not only upon intrinsic value. In Harris many women had spun and woven for sale for over a generation before 1914, mostly weaving pure hand-spun yarn, and they continued to do so. For many years before 1914, an occasional weaver was to be found in villages in Lewis too, generally weaving a handspun weft upon a mill-spun warp. By 1939 it was estimated that there were about 1200 looms in the Island, chiefly weaving mill-spunyarn, most of it spun in the two principal Stornoway mills. A carding mill

TRADE AND INDUSTRY

useful crofting ancillary which, unlike many others, is soundly based on a definite commercial demand. Various industries use the extracted acid for some 150 products. The Scottish alginate industry, the second largest in the world, is based on the process of E. C. Stanford, who discovered alginic acid in 1883, though today modern methods are used. For raw materials it has turned to the old kelping shores of the Hebrides and Northern Isles. On the island it has a factory at Keose on Loch Erisort, a site chosen for the easy access afforded to puffers; the factory receives the weed, dries, mills and bags it, and the boats then carry 200-ton loads to Girvan. The factory itself involved some £30,000 of capital layout and has a capacity of 120 wet tons per week—4 wet tons producing 1 dry milled ton. About a dozen Harris and Lewis crofters gather the seaweed crop, the most useful type being bladderwrack or rockweed *(ascophyllum nodosum)*, from the shores at Loch Erisort, East Loch Roag and Bernera in Lewis, Husinish and Scarp in Harris, and Loch Seaforth. Where there is road access the weed is cut by sickle and loaded into a lorry, but more often it is cut at low water to be floated with the incoming tide and rafted to Keose, hauled by motor boat.

A product of the land not readily associated with the Hebrides is bulbs. Bulb-growing deserves a mention, however, if only because the experiment to see whether it could become a commercial possibility in Lewis was carried out by the children of Lionel (Ness) Junior Secondary School. The MacAulay (Rhodesia) Trust made an investment of £150 to cover initial expenses, and success followed. When the original project was completed it was extended, sales bringing the school a useful sum. But an attack of disease brought production to a standstill in 1966.

Another small industry is the aerated-water plant at Ness, which is operating with reasonable success, and could do better if imports of aerated waters from abroad were reduced. A number of recent surveys made in the island have found great interest in such activities as shell-fish processing in Harris to produce semi-preserves, using mostly cockles and mussels. Local knitting already has a name for its products and a potential for extension on a commercial scale; this latter began in late 1966. Some forty years ago knitting specialists went to Lewis to investigate the possibilities

PRESENT INDUSTRY

of a knitting industry based on the crofters, who would use Lewis yarn and produce knitwear in addition to their woven fabrics. However, it was found that the yarns used for Harris Tweed were unsuitable for knitwear, not being given sufficient twist in the spinning: before women use this tweed yarn for knitting, it is common practice to twist two or more threads of yarn together on a hand spinning-wheel.

Little in the way of craft work is done on the island, mainly because of the lack of indigenous materials which could be used to produce typically-island items. Marram-grass has been suggested as being suitable for making agricultural wind-breaks, and close-woven basket-work. Shore-stones and pebbles are plentiful both in quantity and variety of type and colour.

Small employment outlets on the island are marine and motor engineering, mainly based on Stornoway, and boat-building. This latter is a small but socially-significant firm in Ness with products with a high reputation. Construction and general building is of some significance, one of the most enterprising firms being built up literally from scratch so as to become a highly-successful island business.

The unemployment problem

The island's unemployment problem is as much a matter of concern today as it has ever been, averaging about 25 per cent annually (representing well over 1,000 people) compared with the Scottish mainland figure of 6.0 per cent; the contemporary figure for Britain is around 3.0 per cent. While unemployment as it affects adults is serious enough, unemployment among teenagers threatens the community's whole future. The island has its Youth Employment Officer, who has an unenviable task. Each junior and secondary school in the island is visited to interview school-leavers, at least once a year; employment advice is given and this is supplemented by Careers Officers' visits.

Such employment openings as exist over the island's limited spectrum are concentrated in Stornoway. They are, however, mainly in shop work, mill work and hotel work for girls, with a few vacancies for apprentices in trades generally associated with building construction. Most of the jobs offered are very much in

THE OTHER ISLANDS

*175 18 [826] even to the extent that the St Kildans used their observations of the flights of birds both as compass and as omen for good or evil. Martin speaks of the islands with amusement and admiration. He indicates that the community was backward in some ways: they were illiterate, and wondered naïvely at the newcomers and their manners. 'The inhabitants of St Kilda are much happier than the generality of mankind, as being the almost only people in the world who feel the sweetness of true liberty.'

In May 1877, when the local tourist trade had hardly started, [276] HMS *Flirt* sailed from Greenock with food to relieve hardship [731] among the St Kildans, and an officer of the Highland & Island Agricultural Society on board reported that 'Tobacco was what they invariably asked for'. The ordinary diet of the island con- [262] sisted of, for breakfast, porridge and milk; for dinner, potatoes and the flesh of fulmar, or mutton and, occasionally, fish; for supper, porridge when meal was plentiful. Seabirds' eggs, from [272] March onwards, also formed a staple food. Tea was taken once or twice a week and the islanders were reported to be 'rather fond [342] of it'. There were eighteen inhabited houses, sixteen of which had zinc roofs, two being thatched huts. The sixteen new cottages had been erected about 1863, 'and are certainly much superior to the inhabitations of the same class of tenants anywhere in the Western Isles'. All were well furnished, peat was used for fuel and [372] there were two watches and one clock on the island. There were [405] some seventy-five islanders; most of the men were old, and only [162] two of them were unmarried, with twelve spinsters still to choose [212] from. All read the Gaelic Bible. The men were mostly tailors, shoe- [463] makers and weavers; every house had a loom. They made all [294] their own clothing, the men also making the women's dresses, and a good deal of blanketing and tweed cloth was made and • [286] sold. Nearly every house had a spinning wheel and a large pot in which the yarn was dyed. The women were expert knitters. Each [462] croft and house was rented at £2 annually, sheep being charged [427] for at the rate of 9d per head; these charges were usually paid in kind.

439 435 [237] Feathers of the sea fowl formed the principal export of the island. The factor paid 6s per stone of 24 lb for black feathers; and 5s per stone for grey. For these he received, in Edinburgh or

121 178 174 182 184 From prehistory to the present day, these geographic zones have played their parts as factors in evolution, although the border-lines have changed at different historic crises, and have been modified by economic and social phase. At times the Hebrides have been more closely linked to Ulster or to Norway than to Central Scotland. In viewing these zones, we shall not find simultaneity in historic events, but comparability in stage and transition, even at differing periods. From the evolutionary point of view, the revealing character of Island life lies not only in static survivals, in what Sir Arthur Mitchell found in the Isles and vividly described as " the Past in the Present ". Island life is characterised still more by the dynamic strength of its continuity—notably of early or primitive Christianity—and also by the late occurrence of changes when, at last, they came.

18 62 174 [423] [192] The social consequences of these regional differences in evolution are profound. In the ' Plain ', to the south-east of the Severn-Tees line, large village communities with ' common fields ' prevailed, forming the later manor villages. To the north and west, the more varied, hillier lands encouraged the continuance of hamlets. These hamlets housed close-knit groups of families, often of no more than four or five to a dozen relations or ' friends '—in Scots even today (much as in Gaelic) the word ' friend ' frequently implies kinship. Each small group [462] formed a team. Together the men ploughed their mingled [476] rigs (or ridges) and herded their stock in common, and on the coast they rowed their boat as its crew. The [241] women, too, did much together, as when they spun their yarn, and fulled or ' waulked ' the cloth that one of them • [286] had woven, helping by turn in childbirth and child-care. [423] Usually several of these teams were linked in a larger

exists at Tarbert and another was erected in 'the Bays' district by Leverhulme. Leverhulme also appears to have introduced 'Automatic' hand-looms into Lewis. Today as in the past, the weavers possess a little croft or a feu, a cow, and a few sheep on the outrun, and perhaps a small boat.

Commercial fishing and weaving cannot, however, be satisfactorily combined, for seasonal alternation of occupation entails waste of gear and plant, and interferes with efficiency. Thus in the North Lochs fishing 'creek' (Leurbost neighbourhood, immediately south of Stornoway), weaving became important, but none of the seven large herring fishing boats (still registered in 1930) had been fitted with motors after 1918; they were idle and rotting, and by 1938 only one was still registered. In South Lochs, however, motor-boats were purchased, but there is little weaving. An obvious reason for the difference is the accessibility of the North Lochs area by road to Stornoway. Light passenger cars bring yarn to the village, besides groceries, etc., and take away rolls of tweed. South Lochs, on the other hand, considerably further from Stornoway by road, is still within reach for marketing fish. In North Lochs, merchant seamen at home and young men on their return from three months' work on East Coast fishing boats, turned increasingly to the 'Automatic' looms, manipulation being easily learnt; but such intermittent work alone gives little hope of progress. There is no more fascinating problem than the future of improved weaving.

2. *Unemployment and the Island Budget*

In the past, the storms of the Atlantic washed up on the Island shores the wreckage of world commerce; and

(*above*) Weaving Harris Tweed in a crofter's home; it is usually done in a byre or shed on the croft. View taken from the warp end of the loom

/p. 125/

(*below*) Setting up the loom

How then can the situation be assessed, as it was before the outbreak of war and since then? By 1939 twenty years had been partly lost; for the after-war years of the 'Lever-bulme boom' were followed by discouragement and poverty. During that time one might have hoped for half a generation of reconstruction and progress. On the other hand the score question of dividing the farms was settled, so bringing raiding to an end. Congestion on the crofting ports is less than it was, owing to this fact, and to the provision of feus. The poverty of many breadwinners who had migrated to the cities first cut down the amounts remitted to their Island dependents, then drove them home. A croft, or even a garden site, and the opportunity of building a good house there made life still worth while, if both her employment had failed. Unemployment relief, though tempting some to idleness, gave a respite which many utilised to make a fresh start. As fishing crofting is less than advantage of the easy beginning offered to learn a new trade—weaving. This has made many feel that the living to be found on the Island is better than alternation of 'wage-earning' with unemployment, in Glasgow or abroad. They believe the situation of the Island community to be hopeful. While the land remains little better than before, many, even of the younger people, still care for the Island life among their own kin. Given a clear lead, these could reorganise themselves, and undertake the developments needed in fishing, weaving and reclamation. The homes are sound, 'good neighbourhood' endures, and given fresh opportunity, the community could awaken to new life.

During and since the war, co-operative marketing was

summer, were last used for cattle six to eight years ago by people in Berneray, but now are in use again. There, there are 3 cattle-sheds, one of which is used for cattle, and the remaining two for sheep. The cattle-sheds are of rubble, and are either in the east of the township or near the shoreline, were not used after about 1930, while the adjoining fishing shelters were last used in 1950. Mangerds may have had the original shortage in the east of Lock Melaport about a mile south of the township, but after obtaining the enlargement from Meshaiss Farmstead about 1939, shelters were used in that area.

No peats are cut on the croftes; the peat-cutting areas for all three townships are near the road and in no case for long distances. The common pasture over the croftes leaves evidence of former cultivation, but it is at least fifty years ago since crops were grown on it. At the time the croftes were set up, the land was considered unarable, and was given to them in the croftes and all croftes land on the township was already under cultivation. Today, none has held this 'old arable' is being cultivated, and in several cases the land is semi-moist by not grazed.

There are now no (hatched houses (shelters) in the township and most houses have modern slate or corrugated iron roofs. Some croftes have built concrete two-storey byres of modern design. In Breakish, where the hills in the east provide a good catchment area and the Breakish river a good source of supply, all the croftes have their own private piped water supplies, while in Idrigill and Mangersta most croftes now have, or are getting, a water supply. All croft houses are supplied with electricity from the grid.

Commercial fishing has long ceased and so there are only three boats there to now very little fishing for domestic use, the principal use of the boats being to carry sheep and off-shore islands. Weaving is an important occupation, and during 1939 they were kept busy; the Harris Tweed Co. Ltd. gave them a good price, and during 1939 they were kept busy; in 1938, however, the sales were substantial. Weaving cannot be said to bring in steady income here, and some of the weavers, and others, find additional employment outside the township; this includes part time at the hydro-electric scheme at Glen Sligachan, Mangersta Ministry of Civil Aviation station, and some work at Uig. Of the 48 men in Mangersta, 10 are in the Ministry of Civil Aviation station, one some of interest which he likes and, and other alternation of 'wage-earning' with unemployment, in Glasgow or abroad. They believe the situation of the Island community to be hopeful. While the land remains little better than before, many, even of the younger people, still care for the Island life among their own kin. Given a clear lead, these could reorganise themselves, and undertake the developments needed in fishing, weaving and reclamation. The homes are sound, 'good neighbourhood' endures, and given fresh opportunity, the community could awaken to new life.

During and since the war, co-operative marketing was

An attempt has been made in

Ch. 10 and 20 to relate the size of the stock carried on the croftland croft to the size of holding and to the available feeding and the labour force. Here, we are in some difficulty, for the croftland croft is not a unit of production, and the common grazing is not a unit either. Some of the croftland croft is used for tillage and use of building or labour availability. The inclusion of the pattern of equilibrium for crofters times in Figure 10 reveals a somewhat complicated picture. In the case of crofters with regular work and full time croftes, these are the age of forty-five carry a number of cattle and sheep, and the number of cattle is in proportion to the number of croftland croftland croftland

432 distinctive geographical features, and nearness to the
363 sea: Ceann a Stigh (or Ceann a Stigh Bhaile, or Baile
103 Stigh, the "town" at the "head" of the road "in" by the sea), Bhailebhir (an area identified with the keeping of cattle), Gearraidh Mor, Creagan, Fluic, and Mach a Chul ("out the back," by a road built relatively recently). A street which leaves the main road and cuts into the moor, or common grazing land, is called Grinnbhat, from the name of a nearby loch.

511 The presence of a large Harris Tweed mill in
[348] Shawbost has contributed to a high standard of living
• [228] within the village. It is estimated that only 25% of
[448] the households of rural Lewis have cars; about 50% of the households in Shawbost possess them. In 1970
[342] Shawbost had only one occupied sigh dubh, or "black house" built of dry stone and roofed with thatch, which to many islanders symbolizes a past life of poverty and adverse times. Modern appliances such as refrigerators,
[484] deep freezers and electric toasters are common in
[251] Shawbost. Most homes also have television sets, and
[207] many have telephones.
[206]

289 The mill in Shawbost employs between 60 and 70
463 persons to dye, card and spin yarn, to prepare the yarn in warps which are then delivered to weavers who work in their own homes, and to darn, wash and market the

• 238 finished lengths of tweed. For a tweed to be classified
463 as "Harris Tweed," it must be hand-woven by Outer
[429] Hebrideans in their own homes; but the weavers are
238 essentially employees of the mill. All the large Harris Tweed mills in Lewis, except the one in Shawbost, are located in Stornoway. A few smaller businesses, which design and market tweeds but have no elaborate machinery to process the tweed further, are scattered throughout the island.

621 The village of Shawbost is composed of 169 households,
642 of which 110 are headed by "crofters," persons recognized
[429] as legal tenants of a croft. Of the remaining 59
[341] households, 16 rent houses which were built and are maintained by the County (called "council houses"), 11 have erected houses on the crofts of relatives, and
443 32 have built homes on the common grazing lands. Non-
241 crofters participate in the agricultural activities of the township. It would not be unusual, for example, for a non-crofter to serve as the clerk of a grazings committee.

342 In North Shawbost, one croft house and two non-
[429] croft houses are used only when the owner returns to Shawbost from the mainland for a holiday. The school-
[375] master lives in a house adjoining the school, and the
[443] minister in a manse located between Shawbost and the neighboring village of Bragar.

Chapter 3

CHANGING ECONOMIC STRATEGIES: LAND, SEA AND LOOM

178 In Lewis, the change from a relatively self-
• 226 sufficient community in which land and sea provided
[128] the economic base occurred in the context of the phenomenal rise of the Harris Tweed industry. In the following pages, the history of Harris Tweed is discussed in relation to changing strategies involving exploitation of land, sea and loom. Associated features of social life are discussed. Social boundary systems are defined and discussed in Chapter 4.

A. The Sea

175 Around World War I, nine boats, as long as 27 to
229 30 feet, driven by sails, used to go out regularly from
[501] the Shawbost harbor. From five to seven men, usually
[491] neighbors, had "shares" in a boat. They would go out
[494] fishing during the night and return the next day. "We hauled our lines with eel, for ling. We would catch
[333] maybe two or three hundred. I remember once we caught 1300."

600 in the far north. "There were two fishing seasons.
175 For one season you went to Fraserburgh, Stornoway,
283 Lerwick and Peterhead; and then the winter fishing was
[221] in England, at Yarmouth, Scarborough and Loucester.

I remember in Yarmouth we didn't like the English
[269] bread, it was such a dull color. We liked the pure white Scotch bread."

They lived in small huts, and the work was hard but full of fun. Neighborhood girls used to go together, bringing bedding and different items in large chests to share in the housekeeping. Three girls worked together in a crew, and there were as many as six sharing a room, in double bunks. Some of the huts were so small that there was barely enough room for the beds and the cupboards. At night the boys would come in off the boats. "You were so tired from being up since early morning;
[570] but you were always able to dance. You were treated with
[178] respect; the youngsters today aren't so good." The women who married non-islanders that they met at the fishing were not likely to return.

175 When the weaving started on a large scale, the girls
• 228 were glad enough to have work at home, even though the
464 work was hard." But many continued their temporary
175 absences from the island, working in hotels or as
464
166
367

175 domestic servants among the well-to-do families in
464 Glasgow and other cities on the mainland (see Appendix
166 A).
[367]

175 When the weaving started, some men settled at home
464 permanently, but many continued to come and go between
166 the sea and the loom. In 1931, the ratio of men to
467 women in Lewis and Harris was 100:114. The men came
• [232] home for temporary jobs, such as the construction of roads
[522] or houses. Jokes are told of the common practice of sending for an extension of leave. The men found it easy
[406] to join the Naval Reserve because of their fishing experience; and it brought them a retainer's fee and expense-paid trips to places off the island for several weeks of training during the year. But when the wars came,
[401] "You lose of men to the Navy and to the Merchant Service was heavy.

B. The Land

175 The number of arrears in rent in the Barvas rent
482 ledger at the turn of the century indicates the small amount of money in circulation at the time. Between 1899 and 1914, several crofters paid part of their rent "by work," and six had some of their stock "uplifted by decree." For example, a Widow Catherine lost "one red

231 People kept several cattle, some of which were dry most
[294] of the time. But because everyone was keeping cattle, milk could be gotten from a neighbor. One man was
[244] planting eight or nine hundredweights of potatoes before
[246] the war, some of which would be used to feed the livestock. "You couldn't buy milk then, so you had to keep a cow.
511 And even though people were weaving, they weren't getting
[234] so much money as they are now. It was the barter system
231 here for a long time. So they didn't have the money to
• 283 buy feeding stuff. It was better to spend the time
[137] planting potatoes. Now of course there's more money in the weaving."

After the war, an act was passed which provided free
175 milk for schoolchildren. Milk for the Shawbost school
212 was supplied by a farm near Stornoway, and villagers first
[224] started buying the milk from the school milk van. A strike
175 held by weavers during the war had increased the payments
178 for weaving, and the barter system had stopped. More
238 money was available. As the loom was more profitable,
[468] more people stopped keeping cows, and relied on their
[457] neighbors for milk, or got their milk from the van bringing
[231] milk to the school. And as the cattle got fewer, the
[242] market for bottled milk expanded. A dairy was started on
198 the west side of the island in the mid-1950's which carries
231 milk from Uig to Ness.
454
254

284 By 1911, the number of looms in Lewis had increased to
441 250-300 (Hunter 1964: 42).
175

• [288] By the late 19th century small mills had replaced
[184] domestic spinning and weaving in the Highlands on the mainland. Weaving continued to be a home industry in the Hebrides where it was encouraged by the support of non-profit-making organizations such as the Highland Home Industries and Arts Association, the Scottish Home Industries Association, and the Crofters Agency—all established at the end of the 19th century—and also encouraged by local merchants who had begun to act as middlemen in marketing the cloth. These merchants owned small general stores throughout the island and either bought the tweed from local weavers or gave them goods from their stores in exchange. Many of the tweed firms in Lewis grew from such small general stores and from the barter system.

289 1. The Harris Tweed Industry in Shawbost: Coinneach
175 Rod, a man who started a tweed business on the west side
159 of Lewis which eventually developed into a large mill
472 with equipment for spinning yarn and finishing tweeds, was said to have been a risk-taker, a man who lost the first L50 he borrowed, but borrowed another L50 and never looked back, a man who throughout his life gave fellow

288 businessmen nervous breakdowns because of the risks he
175 continued to take. "He was planning to start some
159 business. At one point it was going to be either
472 distilling or the tweed, and he just happened to go for the tweed."

Some say Coinneach Rod had physical disabilities, developed or aggravated by military service, which made him unable to work like other men, and hence he was forced to find other ways of earning a living. He was a merchant, like other islands who became entrepreneurs in the tweed business.

According to one version of Coinneach Rod's life, he began to handle tweed on a large scale as the result of an accident, when an agent selling tweed for a merchant on the east side of the island arrived on Lewis for the first time, asked for a "Kenneth Macleod, merchant," and was directed to Coinneach Rod of Shawbost.

"He was also an earthy, natural, easy man to get on with. He never changed, even after the money came. He would sit the buyers down with a plateful of cuddies and say 'Dig in,' 'Eat up.' He always ate them whole, and never spat out the bones. The buyers liked that. They liked his easy manner."

175 Between the first and second world wars, the merchant
441 was an extremely powerful figure. When men and women

175 went away to the fishing, their families bought groceries
441 on credit. "If the merchant thought the fishing season
452 would be good, he let them have as much as they wanted; otherwise he restricted them in their buying."

288 The barter system continued in Shawbost long after
175 it stopped in Stornoway. A weaver was given credit in
159 Coinneach Rod's store, until it closed in 1948, for the
444 exact amount of the tweed. He never gave money. "You had
437 to get just the right amount of goods, even down to
472 tuppence in matches." People were forced to buy huge jars of jam which they did not really want or need. Some "cunning" fellows would slip a two-pound pair of shoes into a shoebox marked 15 shillings. "Coinneach Rod would ask if you wanted a wireless, or would a tweed jacket fit your son. You couldn't refuse, or you wouldn't do any weaving for him for a long time."

Coinneach Rod bought looms for many weavers, and they
288 would weave only for him to pay off the debt. "People
175 living on the dole with a large family would go to him
159 and ask him to buy them a loom. He would get the man a
472 loom, and then get him a lot of tweeds to weave so the man
452 could pay him off. It was two tweeds for yourself and one for the loom."

288 <u>2. Centralization and Specialization</u>: Centralization
175 and specialization in handling the production of the tweed
441

288 developed from the concentration of power i
175 of the merchants. In the early days of the
441 all the processes involved in the productio
286 finished length of tweed were carried out
236 families. A man used wool from his own fl
438 aid of other family members, dyed it with
175 carded and spun it by hand, wove it, washe
[386] it, and found his own buyer. Dyeing wool,
286 and washing ("waulking") the finished len
232 was usually done by women. In Harris, th
175 of producing a tweed was carried out by w
462 Lewis the weaving was done largely by men

A woman in her 80's recalls the pro
175 when she was young. Hand-spinning had d
286 time, although the question of whether t
such yarn could legitimately be called h
not resolved until 1934.

"About 1916 or so it took about tw
175 to do a tweed. You bought the wool fro
283 Board. Sixteen bags of wool, costing a
[435] do four tweeds. You needed four one-st

the dye. After

175 dyeing the wool it was spread out, dried and sent to
283 Stornoway to be made into yarn. The yarn was then sent
175 back, and the weaver wove and washed it. About six women
286 [462] were required to do the waulking (the process by which
the cloth was washed and shrunk).

175 "In those days the weavers designed their own
286 patterns, and sold their own finished tweeds. I remember
432 going into town with my brother, we had two tweeds in the
cart. We went into a shop to sell the tweed, and the man
said it was poor weaving. He didn't want to pay the full
price for it. I told my brother to roll it back up, we
would take it somewhere else. As we left the shop, he
told me I had 'good cheek.' In the next shop the merchant
didn't say anything, and gave my brother the regular
price. We went home with L60."

286 The great demand for tweed encouraged the development
288 of more efficient methods of production. One by one the
175 various processes of production were taken over by
178 specialists, and gradually these specialists were brought
[433] [434] together under one roof. Large boilers for dyeing wool
[463] were supplied as a result of actions taken by the Congested
[386] Districts Board, which was formed in 1897. The Scottish
Home Industries provided chemical dyes. The most
[236] difficult and time-consuming processes were carding and
[283] spinning, which small mills on the mainland began to do

286
288
175
178
[236]
[283]
on commission for weavers around the turn of the cent
By the early 1920's, four mills on the island were
carding and spinning wool on commission; and one mil
brought looms into its premises. Lord Leverhulme, wh
bought Lewis in 1918, saw the value of concentrating
weavers in one place and of improving the technology.
He encouraged the introduction of Hattersley domestic
[463] looms, which eventually replaced the wooden looms. T
individual weaver also did his own warping, but after
World War II the mills began to hire warpers to work
time on mill premises. Transporting the tweeds, whic
used to be the responsibility of the weavers, is now
responsibility of the mills. Today all processes exc
the actual weaving are handled by mills, most of which
are located in Stornoway.

Such steps in specialization and centralization
sense to the weaver. One of the older weavers recalls
175 "In the late 20's or 30's you could buy a yard of Har
286 Tweed for about two shillings. It wasn't economical
288 435 any crofter to dye and spin the yarn, weave it and sel
for only two shillings a yard. As the mills enlarged,
they could make it with the machinery because they cou
make it an economic proposition."

175 However, the tendency toward specialization and
286 centralization was in direct conflict with the reasons
288
828

465 465 yards (a weaver's yard is equal to 8 feet, a measure
• 288 which derives from the size of the frame once used
[204] to wind hanks of yarn). Payment varies according to
the number of colors used in the pattern. A weaver
288 may average 2½ tweeds per week when the work is available,
465 thus earning more than mill workers. A female mill
[142] worker earns about £11 or £12, and her male counterpart
about £3 more.

288 Because weavers are classed as self-employed, they
745 do not qualify for unemployment benefit. They may apply
659 for social security, but must submit to a "means" test,
and the possession of bank savings or other assets
disqualifies them from receiving such aid. All British
workers must pay a weekly sum for "insurance stamps," a
certain number of which makes the workers eligible for
small payments from the government during periods of
illness. Self-employed persons must pay for their own
insurance stamps, whereas employers pay for the stamps
of their workers. A weaver who does not keep up with his
payments of over one pound a week for insurance stamps
must pay the accumulated debt at a later time.

471 Weavers face other costs. They buy looms and bobbin-
238 winding machines, and pay for lighting, heating, and the
maintenance of all equipment. The preservation of this
288 anomalous status of "self-employed" is related to the
453

• 288 attempt to preserve the image of Harris Tweed as a
472 cottage industry, and thus maintain its market value.
[139] Many weavers, politicians and businessmen argue that
the weaver should be reclassified.

However, the status of weavers as self-employed
is not simply bureaucratic jargon designed to preserve
288 the Harris Tweed industry. In most employer-employee
466 situations, people are hired with the understanding that
they have certain qualifications and will perform certain
jobs. Weavers are not under such expectations and
obligations. A mill has little idea of the skill or
motivation of the weavers to whom they send their yarn.
Weavers differ in matters such as degree of skill and
state of health, and they also differ in the amount of
time available to weave, and other matters that affect
their production. Some weavers refuse to do complex
patterns; some are busy with croft work and do not want
to do "urgent" tweeds; others who are recovering from
illness may prefer not to weave the heavier tweeds. The
[46] tweed van sent out by the mills to make deliveries all
over the island meets one such variable situation after
another, and thus finds it difficult to meet the demand
of the Weavers Union, that tweeds should be equally
distributed among all weavers on the island. Theoretically,
the mills are supposed to deliver tweeds in strict

• 288 rotation to the weavers who are registered with
466 them.

Other factors also hinder equal distribution of
[602] tweeds. Personal considerations enter; for example,
the managem of the Shawbost mills feel a responsibility
for the weavers in their own village, who are usually
kinsmen. Exclusive distribution to local weavers is
rationalized by saying that the tweeds must be done
urgently; hence they are distributed only to the weavers
who are known to do tweeds quickly.

288 The major factor hindering equal distribution of
471 tweeds is the expense which derives from the decentrali-
466 sation of weavers, that is, the cost of petrol and upkeep
of the vans, which is born by the mills. Before World
175 War II, the weavers rather than the mills were responsible
178 for transporting the tweeds, by cart and horse at first,
[473] and then by motorized transport.

288 During this period, independent entrepreneurs
175 carried tweeds in vans and buses at four shillings each,
402 a practice which stimulated the development of public
494 transportation. Although the number of passengers using
such vans and buses for public transport fluctuated,
the income derived from the cartage of tweeds was in
itself large enough to be profitable and to maintain the
[178] enterprises. An efficient service existed, despite the

• 288 paucity of passengers, which provided rides to and
175 from town many times a day; but with the "development,"
178 that is, the centralization, of industry, public trans-
402 portation deteriorated. Visitors to the island unfamiliar
494 with this history are struck by practices which they
interpret as coming out of a clockless past, such as
the present custom of stopping the bus midway in its
journey to Stornoway so that the driver can eat dinner
in his mother's house while all passengers wait on board.
Such a custom is fairly recent, and indicates the
deterioration of public services to populations which
are marginal to the centralized source of these services.

288 During World War II, when the demand for tweed was
175 high and the number of weavers small, the weavers staged
[468] an effective strike by which they received an increase
in pay and the burden of cartage was shifted from them
to the mills. This did not affect the system of trans-
[178] portation until the mills realized it would be cheaper
494 to run their own transport rather than to pay the independ-
ent drivers a "cartage fee." The mills then began to use
[493] their own vans to deliver yarn and collect tweeds directly
175 to and from the weavers. Once the mills took over trans-
288 portation, they tended to deliver tweeds to weavers
178 closest to the mills rather than to uphold the principle
494 of equal distribution. This practice (made possible by
466
[361]

175 the 1934 decision to change the word "crofter" to
178 "islander") led to the weavers living in council
• 288 houses in town and working in loomsheds behind the
[361] houses. Unequal distribution has also contributed
to Shawbost's relative prosperity, and to the decline
of weaving in more remote parts of the island. The
[444] unequal distribution of tweeds has made it difficult
to maintain a large labor force, which in turn limits
the growth and development of the industry.

288 2. Instability of the Industry: The Harris Tweed
453 industry has undergone a number of crises. Periods of
178 depression have alternated with periods of prosperity.
[458] (See Appendix B for the fluctuation in the number of
yards stamped each year with the Harris Tweed trade-
mark.) The very conditions which give the tweed its
[435] market value—the decentralized, non-mechanized human
[464] element—also limit the possibilities of growth in the
industry, and contribute to the industry's instability.

288 When a business remains small, it must collect
441 orders before it can provide work to have the orders
filled (except when demand for an item is strong, as
occurred around the time of the previous world war;
during the war and for a few years after, tweeds could
be made first and then marketed, because any cloth
[471] could be sold). Only a large business can keep weavers

• 288 at work producing tweeds which it then tries to market.
441 The latter method requires the investment of a great deal
491 of capital to make the tweeds and pay the weavers before
a buyer is found. The small mills require an immediate
return for their capital investment, which is ensured
[434] by not investing unless there is a definite order. The
fortunes of the weavers oscillate with the luck and skill
of the mills in soliciting orders; thus, the mills do
288 not provide a constant, stable source of income. The
434 nature of the tweed, as a high-priced luxury item rather
than a basic necessity, contributes to the instability of
the demand. When fashions change or when world-wide
economic depressions come, the high-priced tweed with
its specialized image as a cloth for aristocratic,
[185] sporty dress is forgotten for awhile. Efforts are being
made to change this image; but the product's status as
a high-priced luxury item persists.

288 An extremely small business can survive periods of
441 depression when capital outlay in the form of machinery,
459 running costs, and so on is not large. An extremely
large business that has cornered a large share of the
market can often survive an erratic schedule of orders
because it has a larger accumulation of capital, but a
medium-sized business has too much overhead to survive
long periods of depression. Examples of all three exist

• 288 in Shawbost: a very small business, which until
441 recently did not even have its own transport but
458 hired facilities when they were needed and simply
went into hibernation when orders stopped coming;
a medium-sized business, which went into liquidation
in 1971; and a large business, which continues to
survive despite a depression which has continued
since the late 1950's.

288 Harris Tweed is sent to markets all over the
441 world; but because of the difficulty of maintaining
464 a large labor force, the filling of orders is sometimes
[429] slow. If large orders cannot be met, weaving as an
island-wide occupation cannot be maintained. The
number of weavers on the island fluctuates, as slack
periods come and men adopt the time-tested strategy
of temporary migration in search of other jobs. One
[469] of the factors which aided the weavers during their
[178] strike of 1943 was the fact that so many other jobs
were available during the war that the future of the
industry was jeopardised.

288 In the last five years the number of mill employees
464 has decreased from 800 to 500. The decrease is due in
[178] part to the introduction of more efficient techniques
and new equipment, but there is little room for improve-
ment in the production of tweeds because the human
element, the weaver, is essential to its production

060 element, the weaver, is essential to its production.
288 In 1960 weavers receiving tweed yarns from the mills
424 totalled about 1,500 persons, a number which held for
462 about three years and then started dropping at a rate of about 100 a year. In 1971 the number of weavers was less than 1,000, and trends of change appeared to
166 presage a continued dwindling of numbers. It is
424 estimated that emigration increased during 1970-71. Men have returned to the sea, have gone to Glasgow as laborers, or have taken advantage of training courses offered by the Labor Exchange, courses that will eventually remove them from the island setting.

288 The instability of the industry and the fluctuation
571 in amount of weaving work available at any given time
458 has created an environment in which personal ties and individual maneuvering rather than a widespread adherence to impersonal rules such as equal distribution are
[608] emphasized. Strategies which involve the mobilization of kinship and neighborhood ties and involve an emphasis on personal relationships rather than the depersonalization usually associated with industry are made possible by economic factors such as the dependence of decentralized weavers on centralized mills. The watchfulness and consciousness of one's neighbors so characteristic of village life prevail. Questions about the state of

288 Questions about the state of
571 "the tweed" permeate all discussions, and often
458 constitute an initial greeting. "Have you got a
[574] tweed in the loom? How many do you have? Did you see Stickey's tweed van going into Pairc? Did you hear that Newalls has an order for about 800 pieces...?"

"The mills brought me two tweeds, and I got two in town myself. I stuck those two in the attic so that anyone who came in would be none the wiser," says one person in a whisper. Neighbors are in and out of each others' houses and loomsheds, observant and questioning, on the lookout for any indication that they have missed out on some transaction in the competition for scarce goods.

D. Weaving as Strategy

286 When weaving was done on a wooden hand loom, the
178 weaver required a longer period of apprenticeship.
402 Weaving was "more of an art," as some of the older weavers remember it siblings. Not only was the shuttle thrown back and forth by hand, but the lifting of different threads in the warp was done by manipulating four foot pedals in the correct order. Today, the
288 process of weaving is very much simplified: the weaver
178 pushes only two foot pedals, and simply keeps an eye on
402

288 the automatic shuttle; all other processes have been
178 built into the design of the Hattersley loom (cf.
402 Thomson 1969). In other words, weaving does not entail
288 very specialized skills and is not difficult to learn.
463 A sailor can come home and learn to weave in a short period of time, or pick up the trade again with ease after having been absent from the loom for a long time.
[571] Neighbors substitute for each other when someone is ill
[573] if a tweed is "urgent." Wives help their husbands, and young boys their fathers and uncles. Such low-level specialization and substitutability are complementary to crofting activities and the maintenance of neighborhood ties, and may be seen to favor continuance of the occupation of weaving.

874 The Lews Castle College in Stornoway, established
286 as a technical college in 1953 in a building that was
[467] formerly the home of Sir James Matheson, offers training courses in weaving for adults which last for ten weeks and qualify a person for membership in the Weavers Union (cf. Stornoway Gazette, March 16, 1968). The
[572] college also sends weaving instructors to all the public schools on the island to instruct young boys in the
654 rudiments of weaving. The Highlands and Islands
286 Development Board have in the past offered loans and
288 grants with which to purchase looms, and government aid has protected the mills.

284 Despite these aids and incentives, parents do not
288 encourage their children to weave. The weavers them-
178 selves describe the job as dull, offering no security
368 and no possibilities for advancement.
593
324
[461] Referring to her young son, a mother says, "By the time he's old enough to weave, the tweeds will have failed." Another mother says, "I want him to learn some trade, if he's intelligent enough. I don't want him to stay here. The tweed is so uncertain." "There's no future in it," says the father of another young boy, "I definitely wouldn't want him to be a weaver. It would be good if he went in for engineering."

43 The histories of the weavers reveal many examples
464 of shifting occupations. Weaving often alternates with
286 work in the local mill, which is also relatively unspecialized. The Shawbost mill must tolerate this unstable labor force, as labor is difficult to find.
[164] Eldest sons tend to leave the island for more stable,
[573] permanent jobs, leaving the croft and the loom to their younger siblings. Table V[1] shows the number of male weavers in each age group.

288 The fact that Shawbost has the same age structure
464 as the rest of rural Lewis (see Table II)[2] and less
162 unemployment signifies that weaving has not served as
166 an adequate incentive to keep young people on the island.

[1] [See p. xi--Analyst]
[2] [See p.xiii--Analyst]

288 Rather, the industry has provided jobs for those who,
428 for one reason or another, would have stayed anyway.
162
166 Of the weavers between the ages of 15 and 24, eight are only sons or sons who had to begin work because their fathers became ill or died; two others live at home only temporarily and plan to work elsewhere. Of those of ages 25 to 34, two men live at home because they are disabled; one has returned from the Merchant Service for awhile; two are only sons who are encouraged to remain at home, and several are youngest sons or sons whose parents have strongly discouraged them from leaving home. Of the 35-44 age group, four have remained on the island because of various ailments such as tuberculosis and mental health problems; one had to leave the Merchant Service because of an injury; at least five have stayed or returned because of family ties, the demands of aging parents and sick siblings. In the 45-54 age category, a number of men served in the navy or other branches of the armed forces during World War II, and returned from shipwrecks and other disastrous events to the relative security of the loom.

Many of the older weavers (at least nine in the
288 55-64 age category) started weaving after they had
167 returned from the United States or Canada because of
162 the depression. Some recall the horror of wandering

288 through alleys to rummage through the trash cans of
464 hospitals or other large institutions for food. The
167 occupational histories of the weavers support the
162 generalization made by an official of the Harris Tweed Association that the younger weavers leave because they do not like the weaving and they are replaced mainly by older men who want to settle down after a life at sea. (See Appendix A for several life histories of weavers.)

E. Crofting as Strategy

241 Because of the relatively high income provided by
288
434 the Harris Tweed industry, those who remain within the township have tended to emphasize weaving and neglect the croft.

592 1. Croft as Place of Residence vs. Agricultural Unit:
Most of the 169 households consist of married couples with
[592] their unmarried children. A tendency to marry rather late in life and for children not to marry while their parents are still living is evident in Table VI[1] (Partial List of Households According to Type of Household and Age of Household Head).

Fourteen households of married couples and their children (not included in Table VI) include at least one

[1] [This source as received did not contain this table--Analyst]

657 their houses are located, and that most of the land be
185 freed for use by more active crofters, but the ideology
423 associated with possession of the croft makes such a
883 plan extremely difficult to implement. "The croft is
311 your base, the only thing you have. You don't want it taken away, even if someone else is using it already anyway. Our county councillor suggested amalgamating the unused crofts at a recent meeting. No one said anything, but no one wants it."

592 Of the five households that have the use of three
241 crofts each, one consists of a bachelor who uses the
311 crofts for grazing a large number of sheep. A second household is composed of two brothers who had stayed at home to take care of their aged parents. One of these brothers recently married, after the last parent died. These men keep cattle and sheep, and both weave.

A third household is headed by a married man who
592 has recently sold most of his livestock in order to
241 "concentrate on the weaving." His father, who used to
311 haul peat with a horse and cart in exchange for the
288 use of grazing land so that his family never had to go to the sheilings, died a few years ago. "My father was a crofter only. The weaving didn't start until the 30's. He was wounded in the war. He got a pension and sold a cow or a few sheep each year. But I didn't

behind the tweed's popularity. The tweed was more than a cloth; it was peat smoke and windswept moorland, the image of the free man who had escaped city life and machines and was the master of his own destiny. Steps had been taken all along the way to preserve the image of home-crafted goods, as when, in an effort to prevent machine-spinning, carding mills were built in Lewis and Harris at the turn of the century to prevent wool from being sent to mills on the mainland, where it was both carded and spun. As early as 1906, a man was convicted in London of selling power-loomed tweed under the name "Harris Tweed." Today power-driven looms can produce double-width cloth 54 inches wide, a width much preferred to the 28-inch cloth produced on the Hattersley loom because there is less waste when the cloth is cut. But because "Harris Tweed" must be hand-woven, new looms of light-weight metal are being designed on which double-width cloth can be hand-woven. The new looms will cost so much that many weavers say they would be unlikely to invest in them, especially given the uncertain future of the industry.

The Harris Tweed Association, formed in 1909, was granted a certification mark by the Board of Trade which was stamped on tweeds that were hand-spun and hand-woven in the islands. During World War I, hand-spinning died

175 178 288 286 441 out in Lewis, and the Harris Tweed Association was ineffective in enforcing its standards. In 1934, weavers were allowed to use yarn spun in island mills, and production increased; but no weaving was allowed to be done in the mills. All looms were removed from those mills which had tried to centralize this stage of production. The actual process of weaving remained, by legal definition, decentralized, although the word "crofter" was changed to "islander," thus widening the category of persons who could weave "Harris Tweed," and paving the way for centralization of weavers in the town of Stornoway.

286 288 467 Any person can purchase his own yarn, weave his own tweeds, and sell them to tailors or summer tourists; but before a weaver can weave for the mills, he must be registered with the Weavers Union. The Weavers Union is a branch of the Transport and General Workers Union, which includes mill employees, hospital workers, lorry drivers, and others. It is an anomaly of the Harris Tweed industry that workers classed as self-employed should join a union of employees and is another indication of the centralization of control and power in the mills, with whom the weavers, along with the mill workers, bargain for higher wages. Weavers receive a basic sum of over £10 for each length of tweed, which is usually 38 weaver's

288 467 288 435 466 804

592 24 31 288 like to leave the loom for the time it took to look after the sheep."

592 23 24 [233] [246] [288] [463] A fourth household consists of three unmarried siblings in their 40's and 50's who recently sold their cattle and now keep only sheep for their own consumption. They cultivate a small amount of oats and hay to feed the sheep during the winter. The brother who was largely responsible for taking care of the livestock is now "concentrating on the loom," and his brother works in the mill. Their sister, who used to work in hotels on the mainland, now keeps house for them. Described as a [409] [404] "self-contained family," they have a tractor and a deep-freeze and take care of their peat and the harvesting of crops by themselves. One of their crofts has become 654 423 too waterlogged even for grazing and was sold recently to the son of a local crofter, not for agriculture but as a prerequisite for applying to the Department of Agriculture for a housing grant. Only tenants of crofts can apply for such grants. As this particular croft is too wet to be cultivated or used as a house site, the only motive which the new tenant has to become a crofter is to gain access to governmental subsidy.

592 233 311 The fifth household is composed of a retired couple and their son and his wife and family. They have no cattle, and use the crofts for grazing sheep.

241 288 183 233 The competition between the loom and the croft is evident in the few communal township practices which still exist. One of the rules of township organization is that all households must bring their sheep in from the moor on the same day. Other rules are that no one [231] should go out on the moor at any other time with a dog, and everyone who has sheep should go out on the day designated by the township grazings committee to collect them. The moor is extensive, and the sheep wander over a wide area. Only if a large number of men go out together and come in with their dogs like a wide net can the sheep be brought in with a minimum of effort over the stream-cut, uneven ground. Anyone who goes out alone disturbs the grazing animals and probably drives them farther away from the village.

233 183 These rules have strong ethical import and are much more than a set of procedural rules prescribed by the Crofters Commission. "There is a code of ethics which you learn as you grow up, as you go with your [578] elders out to the moor. You can fight with a man over a woman and make it up next week; but if you fight with a man over a sheep, you won't make it up for thirty [178] years." That these rules are weakening in importance is indicated by situations in which only two or three men have gone out in the early morning to bring in the

One crofter who gets subsidies says that he keeps sheep and ploughs the land to feed them only as a "hobby." He uses the word "hobby" because, in comparison with the income he gets from working regularly in the mill, he does not get a good return for his investment.

A crofter who has been weaving all his life says that the income he receives from his cattle and sheep does not compare with the income he receives from weaving. Subsidies are counted as an important part of the income he receives for the livestock. "Last year I got L28 for a heifer--not a very good price, but then I got an L11 subsidy as well." He does not believe that anyone could make a living from crofting alone. "You say some of the people in Uist are able to make a living at it? They might be getting social security as well, they're that sly. Anyway, members of the family are probably sending money home from sea or from the mainland. You need a weekly wage. If the tweeds disappear, the only thing a man could do would be to go to sea." (See Appendix C for an example of the balance sheet of a croft.)

A few families work seriously at rearing cattle for sale in local or town markets. These are usually composed of several male adults, of which one or more work in the mill or do weaving and someone is largely responsible for croft work. Most of these people look

For some weeks after returning, the couple goes visiting with a bottle. The scope of visits seems to have narrow to close relatives unable to attend the wedding, and sometimes the custom is referred to as old-fashioned. The bride usually mails pieces of bridal cake to relatives who were unable to attend the wedding.

2. Death: At a time of illness or injury, an individual may see persons he has not seen for years. The house is filled with a constant flow of visitors, and the visitors recount every detail of a sick person's pallor and movement. The room is usually occupied by visitors when a person breathes his last.

In the past, work ceased in every house in the surrounding neighborhood when a person died. This no longer occurs. (The story is told of a weaver who calle a mill in Stornoway to say that he could not finish an urgent tweed because there had been a death in the village, and was told, "You keep on weaving till the weaver dies.") However, dances in the village are cancelled, and the bothan (an isolated hut in which liquor is sold illegally) may close. Outdoor work, such as peat-cutting, which would be widely seen is avoided.

Word of the death spreads throughout the village an beyond within a few hours. From an immense, accumulated inventory, memories of the deceased are brought out,

288 The Harris Tweed industry has provided a higher
434 standard of living, but income from this source is
[458] inconsistent. The standards developed during prospe
[342] times cannot be met during difficult times. Many-ro
[336] houses with indoor plumbing are more heavily taxed t
[661] smaller, less modern homes; loans must be repayed;
[426] a car and a television once gotten are difficult to
[945] give up. A weaver must pay for his insurance stamp,
[651] which amounts to over L70 a year; and income tax ta
a large percentage of a person's income, in large lu
sums which are paid twice a year rather than in smal
amounts throughout the year. When income fluctuates
any constant demand for monetary outlay constitutes
liability.

654 To many persons outside the island concerned wi
181 Highland and Island development, Lewis has a reputat
for "subsidy-grabbing." According to one official,
"The people are too used to getting subsidies. They
tend to sit back and rely on the subsidies, which
makes it difficult to develop the place."

[829] "We pay tax," said one weaver. "Why not get ba
what we can in subsidy?"

651 Income tax collectors shake their heads in desp
434 at the thought of trying to get a true estimate of a
crofter's income, except for jobs such as weaving fo

HARRIS TWEED

• 288 Today, with kelp long forgotten and fishing of minor importance,
[178] it is the Harris Tweed industry which supports many of the island people, either directly or indirectly; an island cottage industry with exports earnings exceeding £2,500,000 a year. Harris Tweed is exported to some thirty countries, including America, Canada, Australia, New Zealand, Japan and all the European nations. The industry is in fact the basis of prosperity in the area, both dependent upon and supporting the crofter-weaver working at
286 the handloom in his home. Seven million yards of tweed are
288 woven annually by the independent weavers 'on the books' of the
466 various mills. The weavers must finance themselves, buying their own looms and bobbins, equipping and maintaining their workshops. Though they receive their supplies of yarn from the mills, they are graded as self-employed persons and as such are not entitled to unemployment benefit—a subject which has caused much argument.

286 One of the most outstanding facts about the cloth is that its essential qualities have remained unchanged since the industry's early formative years. But it has astonishing versatility and over 5,000 patterns are available, including the crotal browns and the heather colours.

288 A weaver on average can produce about 2½ webs, or tweeds,
each week, a web measuring about 80 yd by 28½ in, and gets a
286 reward of some £8 per web, according to the intricacies of the
[465] design or the number of colours involved. The money is paid out
[453] by a mobile bank making the rounds of the townships throughout the island. It is reckoned that the mills, for their part, make 1d to 6d a yard profit, depending on turnover; the total annual value of the industry's output is in the region of £4,000,000.

[236] Between them, the five mills in Stornoway and the one in Shawbost consume two-thirds of the Scottish wool clip—the native Western Islands' crop is sufficient for less than a month's production. A thousand pounds of raw wool end up as 885 yards of finished cloth.

finished cloth. About 1,000 workers are employed at the mills, representing about 95 per cent of the island's industry—not counting, of course, the 1,200 or so self-employed weavers. The Shawbost mill, started in 1915 in a very small way, employs about seventy people from the surrounding crofting community on dyeing the wool, carding it and spinning it into yarn, and has about 500 weavers on its books. In 1955 it became a limited company and a £35,000 finishing plant was added; other recent extensions have been made to the tune of £70,000. The establishment of such a large industrial complex in one of the remotest parts of Britain is an achievement to be underlined.

288 464 [473]

The early cloth industry

Coarse woollen cloth has been made in the Hebrides, as in other rural Highland areas, from time immemorial. Rents were often paid in blankets or plaiding. In 1656, 'pladding' was one of the items of trade brought by Highland boats to Glasgow for sale there. In the late eighteenth century, blackfaced sheep were introduced into the Highlands and islands; the fleece from this breed was much heavier than that of the native sheep and consequently proved ideal raw material for local woollen manufacture for trade. In the Hebrides, the product was mainly for domestic and local consumption. The people of Harris, however, were well known for the excellence of their weaving which found a limited external market. In 1844, the Earl of Dunmore, the first non-native proprietor of Harris, had the Murray tartan copied in tweed by local weavers, so successfully that the Earl and his enterprising wife encouraged improvements in the product and introduced it to their friends. The cloth, ideal for outdoor pursuits such as fishing and stalking, found ready wearers. In 1857, an Edinburgh lady went about getting orders for the Harris weavers, and business increased so much that in 1888 she moved to London and opened a small depot for tweeds.

288 175* [427] [236] [438] [439] [444]

Thus by the time the nineteenth century had reached maturity tweed was becoming well known, and weavers and local merchants, usually shopkeepers, developed sales contacts on the mainland. At that time every web of tweed produced was unique: it could never be copied exactly. This of course added to its charm

in the eyes of the more sophisticated purchasers, as did the domestic and primitive conditions of its manufacture. All processes were carried out by hand. The wool was washed and dyed out of doors beside any convenient stream where a big black pot could be set up on stones and heated by firing peats. Carding, a tedious and unpleasant task, spinning and weaving were done in the 'black houses' of the crofters, which often lacked chimneys or proper windows: the tweed acquired more by accident than design a definite 'peat reek', which was duly considered to be another of its attractions, combining with the mainland town-dwellers' pleasant thoughts of Hebridean thatched cottages, peat fires and natural dyes from island moors and shores, to give the cloth something of a romantic aura.

Development

The increased demand brought problems however. Carding by hand was a slow business and quite unable to keep up with the weavers' requirements for raw material, so wool was sent to mainland mills for carding. But this introduced an element of suspicion, for the product was not now wholly Hebridean. To get round this, Sir Samuel Scott, the proprietor of Harris in 1900, opened a water-powered carding mill at Tarbert, Harris. In 1903, this example was followed up by a Stornoway merchant, Aeneas MacKenzie, who started a carding mill near the Patent Slip (one of Matheson's enterprises) in Stornoway. Non-profitmaking bodies (the Scottish Home Industries Association and the Crofters' Agency) began to open up more depots for the receipt of tweeds. In addition to the original depots at Stornoway and Tarbert, others were established at Obbe (now Leverburgh), Uig in Lewis, and in North and South Uist.

The Congested Districts Board also took an interest, appointing a travelling instructor who was responsible for the introduction of better cloth designs and other improvements including the flying shuttle. This latter was a distinct advantage over the old method used on the 'beart bheag' (the traditional small wooden loom), where the shuttle was a sheep's shin bone thrown by hand. The board also paid grants for the improvement of looms, and large black pots were sent to Uig to enable the people there to

dye larger batches of wool to maintain uniformity of colour through the whole web.

Lewis tweed

Suddenly Lewis came on the Harris Tweed scene. It had been slow to enter the industry; most of its employment was on works related to public boards and on the private constructions of the Matheson regime. Fishing, too, yielded a reasonable living to most of the Lewis crofters, so the incentive to weave had been small. But about 1880, following the death of Sir James Matheson, expenditure on the Matheson property was severely curtailed; and also about this time fish sales by auction replaced private contracts between fishermen and curers, making fishing far less remunerative to those crofters who had worked as hired hands. So Lewis took to cloth making, taking advantage of the increased demand, which could no longer be met by the Harris workers. Records of tweed production are few until after 1880, but whereas in 1899 there were only 55 looms in Lewis, as reported to the Congested Districts Board, in 1906 this had increased to 161, and by 1911 there were some 300. There was some initiative in London too: in 1906 a person was convicted for selling as 'Harris Tweed' a cloth woven on a power loom.

As the number of island weavers increased, so did the demand for yarn even further outpace the capacity of the domestic spinning wheels. Cheap, mill-spun yarn was imported and this, added to inferior weaving, gave rise to the name 'Stornoway Tweed', indicating a poor-quality cloth. In 1907 the Scottish Home Industries Association closed its Stornoway depot because the amount of hand-spun yarn used did not justify its continued existence. The Crofters Agency, however, kept open its depots at Balallan and Uig. Around this time, therefore, two products were on the market with the same name: a 100 per cent true hand-spun tweed, and a tweed made wholly or partly of mill-spun yarn. In Stornoway it was appreciated that the use of mill-spun yarn did not necessarily result in a poor-quality cloth, and this initiated some new moves. Spinning machinery was added to the Patent Slip carding mill, and in 1906 Kenneth MacKenzie began a new carding and spinning mill.

Thus were laid the lines of a new form of econ tion for Lewis. At first, tweed manufacture here, as strictly a domestic activity: the wool of the croft was clipped, washed and dyed, carded, spun at ho into cloth by persons in the township with the ski suitable cloth; the weaving was a part-time and occupation. Payment for the weaving was in potatoes, or labour. The waulking or finishing o mostly a communal activity carried out by the w turned it into a particular social occasion with d characteristics. If the cloth made was in excess quirements, the crofter sold it directly to a custo local shopkeeper bought it or gave credit for it.

With the rise in weaving for a definite market i changed. Weaving became a full-time specialist o partly because the flying shuttle made the work came predominantly male work. With the use of there grew up a number of merchants, the Lewis bought yarn either locally or from the mainland, for weaving and hand finishing on a commission and the resulting cloth remained their property cloth embodied a handspun weft; at other times p spun was used at all. As pointed out above, it w Harris Tweed, as was the 100 per cent handsp cost about 21d to produce compared with 36 tweed. The cheaper type provided Lewis's ra output between 1900 and 1911, and by that year stripped Harris. In 1912, the handspun yarda Harris was 175,000; partially and wholly millsp some 4,000 yards; and the total value was £26,5 yardage of handspun cloth was some 10,000; bu yards of partially or wholly millspun was sold. value was £44,000.

The trade mark

When eventually the question arose of some ma between the two cloths, it was with difficulty that chants persuaded the Board of Trade that a distin

THE TRADE MARK

sary. In the end, an application was made in 1909 to that body 288 for a trade mark defining Harris Tweed as 'tweed, hand-spun, 441 hand-woven and dyed and finished by hand in the Outer Heb- 175* rides', with 'made in Harris' or 'made in Lewis' added as appro- 424 priate. The Harris merchants had to join forces with their former rivals in the tweed-marketing business, the voluntary non-profit-making Associations. To inspect the cloth and stamp it with a trade mark—an orb surmounted by a cross—a Harris Tweed Association was formed, consisting of representatives of each of the Harris merchants, the Crofters Agency and the Scottish Home Industries Association. Cloth was first stamped in 1911. In 1912, some Stornoway merchants were granted representation in the Harris Tweed Association, which still exists for the benefit of the industry.

In 1934, the definition of 'Harris Tweed' was eased to include any cloth 'made from pure virgin wool, produced in Scotland, spun, dyed and finished in the Outer Hebrides and hand-woven by the Islanders at their own homes in the islands of Lewis, Harris, Uist, Barra and their several purtenances and all known as the Outer Hebrides'. It was further provided that 'Woven in Harris', 'Woven in Lewis', etc, could be added, and also 'Handspun' in the case of tweeds made entirely from hand-spun yarns.

Today, a few Harris families maintain the old tradition, hand- 288 dyeing and carding, spinning on the wheel, hand-weaving and 286 finishing, producing a high-quality article mainly for individual 178 customers. These tweeds rightly command up to three times the price for the general run of tweed.

OTHER INDUSTRIES

It was not until the era of Sir James Matheson that anything like 441 a truly industrial activity was attempted. Matheson, a native of 159 Shinness in the parish of Lairg, Sutherland, was born in 1796. 175* Aged seventeen, he decided on a commercial career and took himself to London. After two years in a mercantile house, he went to Calcutta, where he worked in the counting-house of MacKintosh

166 The image of the island
184 as spiritual home is fostered by The Stornoway Gazette,
323 and by nostalgic songs, most of which were written by
204 islanders who emigrated to Canada in the first quarter
533 of the century.

532 The crofting township as a strongly bounded network
241 continues to exist, although crofting as a socioeconomic pattern which evolved in a situation of limited social and geographical mobility, low cash reserves, and the restriction of a large population to a region of limited resources, is very different from crofting as defined by an office in Inverness. As far as the crofter is concerned, to be defined as a crofter by the Crofters Commission and other government agencies is to have access to resources which affect the environment in which he makes his choices.

241 The individual is faced with the semi-security of
288 crofting and weaving, in contrast with the exciting but risk-laden opportunities offered by the dominant urban-
54] industrial mainland. Crofting and Harris Tweed have been protected by government legislation. Various subsidies
45] and loans are available. In times of unemployment, social security is available. Extremely important as contributers
21 to boundedness are the non-economic incentives: the
56 individual has a place in a human community; he is given

105 The Harris Tweed industry is lauded as an
241 industry which is compatible with crofting. Because
• 288
632 weavers are self-employed, they can set their own schedule of work and thus continue to participate in croft work and fulfill various township obligations. The effects
[121] of this industry on the township as a social boundary
[434] system were investigated. The income available from
[463] weaving is unpredictable, which encourages the retention of crofting practices and other patterns of behavior, such as "occupational pluralism," that were found to be
[476] adaptive in the past. Such strategies also strengthen
[182] township boundaries; for example, they encourage mutual
[434] aid and communal township practices. But weaving also
[407] offers a high level of income; and some weavers, preferring to spend most of their time weaving, have neglected crofting, or have invested in tractors or other motorized transport which enables them to harvest crops, cut peat and perform other activities independent of other township members.

105 The fundamentalist Free Church constitutes an important
621 boundary-maintaining mechanism, serving to exclude various
795
632 external influences of the larger society from the township.
184 However, a smaller network of persons engaged in the
105 religious sphere of social activity, a subsystem within
794
621 the township system, also exists which has the appearance
632 of a firmly bounded system. These are members of the clique
184

241 654 Cultivation for subsistence is minimal, and in
part stems from government-defined privileges and duties
288 regarding maintenance of a croft. The Harris Tweed
477 industry, which is restricted to the Outer Hebrides and
464 thus is protected from competition, has provided work
for a large number of islanders. Many of the younger
166 [434] members of croft families live in cities on the mainland,
and send part of their wages home; they return regularly
[162] to the island, and many plan to retire there. Thus the
[632] township supplies urban workers who remain very much
attached to the rural townships, which are composed of
511 aged family members and a rural proletariat. The standard
454 of living is high, and many crofters have accumulated
273 savings, although much of this surplus is used by the men
for alcoholic drinks.

12) In Britain, rural communities have been interpreted as lying somewhere along a rural-urban continuum (cf. Southall 1959, Frankenberg 1966). In 1959, Southall presented "an operational theory of role" by which he suggested that heterogeneous societies may be analyzed and compared. He developed the concept "density of role texture" to describe societies which lie along a continuum from rural to urban. Frankenberg (1966) uses Southall's concept along with other concepts to present a more complete model of an urban-rural continuum. The "models" of both Southall and Frankenberg are essentially lists

*159 781 787 later that these were all people who eventually got the curam. The only conversion I didn't expect was Norrie Bheag. I saw her one night crying outside the church, and knew her time had come.

"In the dream I was at the very end of the line, only I wasn't wearing a white dress. I was naked, and kept trying to cover myself.

*159 781 [761] "Not a day passes that I don't think of death. I want to pray, but I don't know who to pray to. I've been going to church regularly now, sort of hoping and sort of being afraid that I'll find the answer. I've read too much, and I met too many kinds of people while I was working in Glasgow. I didn't live near other people from Shawbost when I was in Glasgow. I got to know Jews, tinkers, Catholics, and Jehovah's Witnesses. The world is full of different religions. I believe that you can convert to a religion, from to Buddhism or to Christianity, but not to a church like the Free Church or the Church of Scotland. This place is called Tir an t-soisgeul where the true gospel is preached, but the whole world should be called that."

Ruaridh Dan

*159 ● 288 Ruaridh Dan was married in January and began to work as a warper in the Shawbost mill the following October, just after the end of World War II. He had been weaving

*159 ● 288 with his brother-in-law, but they had only one loom. At that time the mill was buying yarn from other mills in town, warping it on the mill premises, and sending it to the weavers together with the yarn for the weft.

Ruaridh heard through the grapevine that more warpers were wanted at the time, and went to ask "the old man, Coinneach Rod, himself," about the possibility of his [465] getting the job. He worked with five other warpers, who averaged five warps a day, at four shillings each. They were paid by piece work rather than on an hourly basis, and received payment once monthly.

Business was going very well. The mill was receiving large orders from America. A few more warpers were hired. [458] A slump came in 1948, and Ruaridh Dan and several others were laid off. Ruaridh went to work for a building contractor, but was called back to the mill after a month's time.

*159 444 After warping for several years, he started work in the yarn store, which dispensed yarn to the weavers. "I was checking the yarn that was going out to the weavers, weighing the wefts, checking the colors that were used, keeping a record so we could tell at a glance what stock we had, how much we would require for any further orders we would get. Well, the job got to a stage where I just couldn't manage it, and I protested. Another man started to work with me. I was paid a regular wage so it was a

*159 ● 288 mill was just about completed and some of the machinery had started arriving. This was the job he gave me, cleaning the machinery, getting it ready for the fitters and engineers to come and put them together. When they really opened up, I was to start at the teaser, in the blending department. I didn't know anything about the job. He told me I would have to go to one of the mills in Stornoway and learn how to work the machinery. And this I did. I went for a fortnight to Newalls. Shawbost and Newalls were shareholders in each others' businesses. That's where the Shawbost tweeds were cleaned and finished. Even today we do some of their urgent orders when they've got too much to handle to meet the deadline.

"After I had this training I taught anyone else who started, like Bochag, after he came back from the army he started with me. It wasn't Bochag who came to look for a job. They went after him because he had worked in a mill in town before he went into the army. They also went after two lads who had been working for years in the finishing department in Newalls, paid them more to get them to come, and over and above that, they were collected every morning and taken home every night. They want people who have worked at the mills in town.

"But as for its being a permanent job, it's difficult to say. Most of the women start working in the mill after

*159 ● 288 they leave school, and most of them get married. I remember about twenty girls working there, and they all got married, and another young girl would start. During [458] the slack periods some men would be paid off. They would start in other jobs, and wouldn't be prepared to *159 464 come back. If you weren't working in the mill you were weaving; there was road work on a very small scale. Except for sailing there was nothing else. For the last ten years or so the big contractors have given people jobs.

"I started with a building contractor but preferred to come back to this job, for the main reason that I had *159 288 458 built this house here. We had slack periods, but we picked up again. But this slack period, it's been two years now, and I don't think it will pick up again, unless they go to a wider cloth. Probably the fashion has changed. People have gone on to other types of cloth. And the merchants and tailors prefer a wider cloth, it's less waste. But that means changing the loom and a lot of machinery in the mill as well.

"I'm sure the weavers wouldn't be prepared to put [435] out the extra cost for wider looms. At the present time, a loom and winding machine cost close to L400. You can imagine what a wider loom would cost, up to L1,000. They don't want the power loom. They're trying to hold onto the Orb trademark for as long as they can. That's the big

*159 ● 288 458 question, whether it would be better to change from the Orb trade and go to power looms. Then you would be able to do any kind of cloth. You wouldn't be tied down to regulations as you are with the Harris Tweed. To do that after all it cost them with the court case a few years back--. But, at the same time, it's more important to have work than this trademark. As it is at the moment, it's just a white elephant."

Neilie Leoid

*159 Neilie Leoid left school in 1931 at the age of 14, as easy-going and generally content with things then as he is 40 years later. "When I was going to school lots of people hated the headmaster, but I had no complaints against him. Perhaps people are inclined to blame other people for their own failures. Of course, I didn't like school very much, and I didn't go to it all that often.

"In those days you didn't have the same access to education as the young people have today. You didn't *159 288 [868] assume you could go very high. You were quite content to settle down to weaving. The boys started learning from anyone who was around. I started weaving with my uncle [434] when I was 15, on an old wooden loom. In one winter [435] we earned the L25 to buy a single-shuttle automatic. My uncle's eyesight was getting sort of dim, so I would

*159 ● 288 stand beside him as he pedalled, and yell 'Stop!' when the bobbin was about to run out. By post-war, the single-shuttles were gone. Most men had the six-shuttle box.

*159 906 "It was all the rage then to join the Naval Reserve. You got a free trip every now and again to the south of England, and thirty shillings a month retainer. I was sailing for about 18 months before I was called up to the war.

"I was in the war for a full six years. I liked to visit every place, but I preferred the white countries. I didn't like Africa or India. China wasn't so bad. Russia was awful. It was cold, and there was nothing you could buy.

"You made very good friends on board ship. You never forgot the face of a man you served with. Most of them were English. I felt very awkward at first with English. I was very slow translating Gaelic into English, not eloquent at all. The English had the gift of the gab. But I got used to this."

*159 Neilie became engaged to marry a Shawbost girl soon after his return to the village but the marriage did not take place for a number of years because his intended wife had to raise the children of her invalid sister. During the year of their marriage he built a new house. His

boat-builders; many of the bodies were 'fearfully and wonderfully made', an understatement that did not go unnoticed by those who had to travel in the emergent public transport. Combined interests led to the formation of the Lewis Motor Owners' Association which agitated for better roads; existing highways were being pot-holed with alarming and uncomfortable rapidity to the detriment of their vehicles. 491 493 175*

Very slowly did public transport become co-ordinated for the benefit of the travelling country folk. Routes were planned and approved. In 1932 there were daily tours for visitors to the island, a series begun by the late John Mitchell, a pioneer in the provision of bus services, with Stornoway as the 'Rome' of Harris and Lewis. In 1935 he was granted permission by the Traffic Commissioners to run daily services between Stornoway and Rodel. 494 175*

The expansion of the Harris Tweed industry was responsible for developing transport, both for conveying yarn to weavers throughout the island and for mill-workers. In May 1933 John Mitchell began a suburban bus service for the people of Stornoway, though more for the conveyance of workers in the fish trade; tweed-mill workers and others were not slow to take advantage of it. In the following month, June, Mitchell ran a bus from Stornoway to the Market Place just outside the town at Bannadrove (Beinn na Drobh—hill of the market), for a 6d fare. In October of the same year, Peter MacAulay provided a twenty-seater Bedford bus for the Carloway to Stornoway run, and this vehicle was not a home-made affair. Meanwhile in Stornoway, a traffic census showed that, on average, 628 vehicles crossed Cromwell Street, the main thoroughfare, every day—and 799 pedal cyclists. [288] • [493]

POSTAL SERVICES

Until the late years of the nineteenth century, the lack of postal facilities were not considered a great disadvantage: few people wrote letters. 205 175*

The *Scots Magazine* in 1756 noted that 'A Post Office is to be established at Stornoway, in the island of Lewis, from the fifth of July next, with packet-boats for maintaining a regular com-

COMMUNICATIONS

The first trans-Atlantic call came in 1935, when the Lewis Woollen Mills were called up by a Toronto mill.

Beam radio came in 1938-39 with two circuits. The stations were on Bennadrove Hill, outside Stornoway, and at Ullapool. In 1942 a twelve-channel link was opened to Gairloch. Outlying villages worked into Stornoway on single-wire circuits, with an earth return, Great Bernera being the last exchange to be served single-wire. One of the island's most remote inhabited satellite islands, Scarp, received its first telephone service only in 1947. Scarp was deserted by its native population in 1971.

The rate of increase in the use of telephone services in the island has been considerable. In 1965 some 1400 customers of the Post Office made almost 250,000 trunk calls. In 1972, the number of subscribers was 2,300. The projected number for 1975 is in the region of 3,500 subscribers who will make an estimated 500,000 calls per annum. In each case, the figure for local calls is very much higher. Every telephone exchange on the island has grown in size; of the twenty-one exchanges, the three largest are at Back, Carloway and Shawbost. In 1964 the Post Office set up a working party to examine the development of the telephone service in the Highlands and Islands. As a result of the party's report a scheme of improvement involving a capital expenditure of £7½ million will be spent on new buildings and access roads, exchange equipment, underground cables and radio equipment.

Stornoway has been provided with a new telephone exchange, and underground cables have been laid both in the town and in the outlying districts. Smaller exchanges in the country areas will have new equipment fitted. A modern radio system between Stornoway and Tarbert is being constructed. To link the island with the South, a new underground cable, costing £1 million, will link Inverness to Ullapool and Gairloch. It is estimated that by 1975 most townships in Lewis and Harris (the latter through a new Exchange building) will be on STD, at a cost of £500 for every connected subscriber in the island.

FISHING

of Lord Seaforth's conduct in this matter. They alleged that he 'draiv in hither an number of strangers who daylie resorts to and fra Holland to the Lewes and continent next adjacent (the Ross mainland presumably) and has caused them be answered of all such commodities as these bounds affords, as nameli with fishes and beeves quhilkis with the hyde and tallow, with manie utheris commodities they transport to Holland.'

To satisfy the Royal Burghs, Seaforth had some of his Dutch friends sent away. But several Dutch families remained in Stornoway until the outbreak of hostilities between England and Holland in 1653.

In Harris, similar efforts were promoted by Captain Alexander MacLeod, who in 1779 bought Harris, together with St Kilda, for £15,000 from the commissioners acting on behalf of General Norman MacLeod. The latter had, in 1772, inherited from his grandfather both the chiefship of Harris and a debt on the property amounting to some £50,000. Captain MacLeod, who skippered the East Indiaman *Mansfield*, did much to stimulate better conditions in Harris, and advocated the generation of a fishing industry. In the face of opposition and ridicule he showed by practical example what could be done to make a success of the herring fishings, introducing a number of east-coast fishermen with Orkney trawls to teach the inhabitants, and reaping a good harvest from the fishings off Rodel, despite the dismal auguries uttered by the Harris-folk. He improved the local harbour accommodation and erected a storehouse for salt, casks and the like, he built a factory for spinning woollen and cotton thread, and twine for herring-nets; he advanced money to those fishermen who were interested for the purchase of boats and gear; and he provided them with rent-free cottages with a ground-patch on which they could grow potatoes. He built roads between the village of Tarbert and the two jetties he made there, and he erected a schoolhouse and an inn. But all this hard work to put Harris on some realistic economic basis came to little. The native population were slow to appreciate the potential income lying about them.

The potential of the sea was of course eventually realised, particularly where the fishing grounds were favourable, Stornoway

LIFE TODAY

LIFE TODAY

As in other Highland areas, some of the island's problems have become so deeply entrenched as to be intractable. They have been the raison d'être of so many commissions and committees of inquiry that their existence is now almost forgotten by the islander—if indeed he ever understood their nature. Crofts have been seen, such as the Crofters Act of 1886 which gave High[illegible] land crofters security of tenure, perhaps the most vital[illegible] measure of the last century for the crofter; all things have not progressed so well since that date; at any rate not so fast that crofting, for instance, is now seen to be an economic unit of land use of benefit to both local community and nation at large. Many problems have been virtually ignored by successive central[illegible] Governments; at least, remoteness seems to qualify a topic for the office 'pending' trap. It has yet to be fully realized that the island, with other Highland communities, is part and parcel of the area administered from London and Edinburgh, and merits as much attention to its welfare as other European governments, such as Norway, give to their remote mainland and island communities.

As usual, charity and self-help begin at home, and one of the most dramatic changes in island life has been the growth of agricultural revolution of recent years which is changing once brown moors to lush green pastures; reclamation by re-seeding. This revolution is still going on. Lewis crofters in particular are showing the way with other Highland crofting areas following suit. The change in the Lewis scene is being emphasised by the planting of shelter-belts of hardy trees and the first of the new plantations of timber-producing trees. These show the promise of the future: a lively future for a lively community. The fishing industry also has a future, brighter on the horizon than it has had for many a poor year. The Harris Tweed industry, the staple em[illegible] ployment source in Lewis, is maintaining its ability to retain the interest of the market. And tourism, once a perfunctory and casual affair, promises to emerge as a useful sector in the economy. There are, in addition, many small pockets of native initiative and enterprise which, given sufficient encouragement

CH. III THE ISLAND HOME

of Ross and Cromarty, with populations of from 1000 to 2000 in 1841. Stornoway began about 1600 as a fishing village with the rise of the fishing trade. Including the literally bounteous population of fishers, its numbers exceeded 5000 by the summer of 1911, though falling back to 1931 when the census was held in the spring.

Still another stage, a fourth, seemed in sight when, in 1918, the first Lord Leverhulme made his bid to centralize the scattered fishing fishing industry of the Island at Stornoway. A cannery factory was established (south of the area shown on the plan) only to be dismantled before its completion, then reconstructed and enlarged in another area—"Leverburgh", South Harris. New housing commenced. When this great venture closed and population stagnated, the grandiose proposal to open the dalgaid vista on Wood's plan and centre it on some great new building, remained a dream. The failure of Leverhulme's great enterprise and its hopes led to discouragement for some years. Yet it is possible that the vision of change given to the Island may have contributed to a renewed capacity for enterprise, individual and communal.

The Island is now attempting to swat the growth of the Harris Tweed industry, and the cannery factory at Stornoway promises to provide yarn for the rural hand-weavers. The town has extended beyond the plan in two main directions: to north-east with villas and housing schemes and to ESE with the great new mills where kippering sheds were numerous from the mid-nineteenth century until after 1919.

Although Tarbert is a shopping centre for Harris and has its spinning-mill, Stornoway has no rival on the Island. The adequate depth of its harbour, combined with its position and access from sea and land, have given

CH. III THE ISLAND HOME

of the place, even the schoolmaster and ministers being from the mainland. Stornoway an important minority of the officials and business men hail from the mainland, and some of them from the Lowlands. New blood has undoubtedly been needed to promote enterprise, to foster new possibilities, and even, at times, to make the best of the past. At the same time, the change between town and country is marked in ways of thought and feeling as in livelihood. To take a single criterion, that of speech, most of the children of the town speak no Gaelic and many hardly understand it. While the percentage of Gaelic speakers may in the country be still over 90 per cent, in the burgh only 70 per cent could still speak the old tongue. By 1951 the ratio, still almost unchanged in the outlying parishes and township, had considerably lessened, in the burgh.

The attempt to harmonise the interests of country and town forms a hopeful aspect of the activities both of the Stornoway Trust, which holds the rural and urban property presented to the burgh and charged to burgh by the first Lord Leverhulme, and of the Lewis Association, formed in 1949 to promote all studies of the Island to guide action for the future. The maintenance of the town's prosperity will depend greatly upon its industries of fishing and of spinning, and these are almost inseparable from the maintenance of the rural population for whom Stornoway acts as regional centre, and who weave with the yarn spun at the mills. Unity of administrative purpose could go far to build up the prosperity of the community.

With the exception of the need for planning aroused by the problems which faced the country with the return of peace, it is proposed, at the centre of the Burgh, to rebuild the whole of the particular area of Point Street,

CH. III BETWEEN TWO WARS, AND AFTER

left the Island. Yet after 1931 many returned, owing to depressed conditions in Depression Society and in towns. When emigrants began to come home the 'Harris' tweed industry had spread to Lewis and offered increasing employment. Some were the fathers of fishing-town-owned Island boats, and others as paid hands (on boats from the East Coast), though losses and unemployment were suffered.

Inter-war changes were hastened with not by movements beyond the Island—an influence as vital for days or four generations before—but by mobility within it. In 1919 a small scale and unofficial land raid was made by crofters, each of the five main roads, with an unofficial spokesman. When crofters crossed the Island to Stornoway they went on foot to present their petition, and considerably later, in a day's journey. Ten years later, Lord ruea, bought second-hand, ran daily to Stornoway from every township. Frequency, ease and relative cheapness of movement came late in an Island with no railway: the mobility of the motor car transformed the transport of the Island change.

'Hand-loom' weaving had become an important, if precarious, resource, important because of the capital generated and the labour employing potential, because of its dependence upon some and sentiment, not only upon intrinsic value. In Harris many women had spun and woven for sale for over a generation before 1914, mostly weaving pure hand-spun yarn, and they continued to do so. For many years before 1914, an occasional weaver was to be found in villages in Lewis too, generally weaving a blanket from the wool spun at home. By 1939 it was estimated that there were about 100 such in the Island, chiefly weaving mill-spunyarn, most of it spun in the two principal Stornoway mills. A carding mill

COMMUNITY FROM PAST TO PRESENT PT. II

developed through the township Grazing Committees by the Scottish Agricultural Organisation Society and its associated Crofters' Agency. Lime and fertilizers were purchased, and wool and other products sold, co-operatively. Some were established in fishing-villages, taking advantage of fluctuating London prices, has led to the reconstruction of ponds for storage. By these and other means, government assistance is utilised but not squandered; rather initiative in agricultural organisation is reinforced; a local communal tradition is now reported in 1950, and employed some 30 men for 18 months before it closed in 1952. Crofting was lightened by some mechanised aids. The war-time construction of ad-fields had ceased, though some harbour-work and road-making was retained by government grants.

In 1949 the Harris Tweed industry, now the Islanders' main source for earning, was crippled by the imposition of a 66d per yard purchase tax. Only a hand-woven Harris Tweed, Parliament decided that as a non-utility product, its export sales alone could be exempt from tax. Viewing the tweed as a luxury, Parliament had forgotten that the Harris Tweed was strong arguments for the extension of the tax to Harris Tweed: the high-grade industry of the Scottish Border or the manufactures of the West Riding should not be subjected to unfair handicap. At the same time the crippling of a handicraft practised by peasant or artist favours mass-production to the loss or ruin of traditional and experimental craftsmanship. Fashion changes to which, in the end, the mass-production is all unacknowledging defeat. The obvious economic handicaps of Island hand-weaving were not, in the opinion of Parliament, a sufficient reason for Harris Tweed, in which the imponderable, 'sentimental

COMMUNITY FROM PAST TO PRESENT PT. II

For a year or two after the war many men and women returning from the Services, the sea or the factories found employment in the flourishing Harris Tweed industry. This included work in the spinning, dyeing and hand-weaving at home—work in which the male weaver was helped by his family in jobs such as winding warps. Many Islanders dared to sink capital in new boats and gear, and risk losses such as those sustained after 1920. Few women wished to return to the hard, unremunerative work of gutting. The whaling station, built on West Loch Tarbert before 1914 and open for a short time between the wars, was reopened in 1950, and employed some 30 men for 18 months before it closed in 1952. Crofting was lightened by some mechanised aids. The war-time construction of ad-fields had ceased, though some harbour-work and road-making was retained by government grants.

In 1949 the Harris Tweed industry, now the Islanders' main source for earning, was crippled by the imposition of a 66d per yard purchase tax. Only a hand-woven Harris Tweed, Parliament decided that as a non-utility product, its export sales alone could be exempt from tax. Viewing the tweed as a luxury, Parliament had forgotten that the Harris Tweed was strong arguments for the extension of the tax to Harris Tweed: the high-grade industry of the Scottish Border or the manufactures of the West Riding should not be subjected to unfair handicap. At the same time the crippling of a handicraft practised by peasant or artist favours mass-production to the loss or ruin of traditional and experimental craftsmanship. CH. III BETWEEN TWO WARS, AND AFTER

value' is important, is an appreciable dollar-earning asset; and because of the fluctuating export market, its manufacturing must be subsidised by other means.

These and other facts support the plea that if some share of taxation had to be imposed in the national interest, should have been done by steps to permit of continuing employment in manufacturing and of adaptation to the carefully fostered market. Where hand-weaving could, even in the national interest, was the imposition of the full 66d purchase tax. As a result of this blow, the crofter's web could not be sold, and lay, a prey to moths, in his house—unless the mill-owner's stock piled up in the warehouse. 'Hand-looms', newly bought or partly paid for, lay rusting in the sheds and the yarn spun for the wool lay in the lofts. Some weavers with their helpers and the employees in the mills, their employers, began to seek work beyond the Island. As the census of April 1951 has shown, the population has been falling as workers trickled away by every steamer. Some adjustment was made, it is true, but in 1953 it looked as the case of the small independent weaver remained as hard as ever.

The amount of tweed stamped with the Orb Trade Mark, which diminished slowly from 4,484,000 standard yards in 1948 to 4,101,000 and 3,786,000 in 1950, fell when the tax was imposed to 2,800,000 in 1951. In 1952 there was a recovery, maintained in 1953. Over 5,000,000 yards will have been stamped in 1955.

APPENDIX I

An effort has been made to separate crofting from other income, and to show the income from the sources of which 2,065,000 were stamped, and some 1,500,000 unstamped). In 1948 the proportion of unstamped tweed had risen to 500,000 yards but stamped tweed came to 4,580,000 yards. Finally, to the productive income earned on the Island there should be added that received by earnings sent to household home to dependants, together with pensions, unemployment relief and the like. I am grateful for the help of the appropriate officials for the figures cited for 1937-38 of the year immediately before the war, and for those for 1948 and 1951 (compilation for losses was short-lived. The outlook is disquieting.

APPENDIX II

RECENT STATISTICS (1951-54)

In before the Island's economy can now be reviewed, in the same order, for 1953, or the period April 1953 to March 1954, as available. The results are shown on the two pages of Tables, pp. 318-19.

(i) Tweed Industry (1953-54)

Taking 5,000,000 yards as the 1953-54 total, and accepting the figure of 2,800,000 yards as the amount finished, and 2,200 yard, payments to weavers in Lewis-and-Harris (and a few in other areas) of £1,800,000 as the total wages paid, £800,000 subtracting the output from Harris, this corresponds to an informal estimate of the basic Lewis Association for Lewis groups of well over £250,000 and more, probably £275,000 for the period. Adding the total of the wages paid in Stornoway and also of carters, dockers, etc., it is thought safe to double the figure, with £550,000, for Lewis, rural and urban. Most of the weaving is in Lewis, Stornoway is the port and carters ports allows rural dwellers to come to Stornoway daily to earn and so have a regular income, and to spend money on spinning and other labour. For rural carters and mill employees, a little of £275,000 is taken here, making £250,000. As an estimate for the 'net earnings' in Lewis is available, the same ratio to wages is taken as in 1948, making £250,000.

(ii) Agriculture, Peat-making and Home Building (1953)

(a) Agriculture.—First, the trend of crop and stock production can be indicated by selected figures for the Island for 1948, 1950, 1952 and 1953. The same both of oats and rotation grass increased, the three successive totals in acre being, 1,[illegible] oats; 4,460, 5,200, 5,440; and for rotation grass: 390, 1,[illegible]

APPENDIX I

be high until 1948. The year 1949 was the peak year for the production of tweed, with over 4,000,000 yards stamped, of which 2,065,000 were stamped, and some 1,500,000 unstamped). In 1948 the proportion of unstamped tweed had risen to 500,000 yards but stamped tweed came to 4,580,000 yards. Finally, to the productive income earned on the Island there should be added that received by earnings sent to household home to dependants, together with pensions, unemployment relief and the like. I am grateful for the help of the appropriate officials for the figures cited for 1937-38 of the year immediately before the war, and for those for 1948 and 1951 (compilation for losses was short-lived. The outlook is disquieting.

(iii) Agriculture, Peat-making and House-building, 1938

(a) Agriculture.—The estimated agricultural output shows total value of £189,500, of which of this total the quantity fed to animal was valued at £40,000. "Peat-cutting" for Lewis groups of well over £250,000 and more, probably £275,000 for the period. Adding the total of the wages paid in Stornoway and also of carters, dockers, etc., it is thought safe to double the figure, with £550,000, for Lewis, rural and urban. Most of the weaving is in Lewis, Stornoway is the port and carters ports allows rural dwellers to come to Stornoway daily to earn and so have a regular income, and to spend money on spinning and other labour. For rural carters and mill employees, a little of £275,000 is taken here, making £250,000. As an estimate for the 'net earnings' in Lewis is available, the same ratio to wages is taken as in 1948, making £250,000.

(iv) Agriculture, Peat-making and House Building (1953)

(a) Agriculture.—First, the trend of crop and stock production can be indicated by selected figures for the Island for 1948, 1950, 1952 and 1953. The same both of oats and rotation grass increased, the three successive totals in acre being, 1,[illegible] oats; 4,460, 5,200, 5,440; and for rotation grass: 390, 1,[illegible]

197 Thus, towards the end of the nineteenth century, the proprietors were stripped, by
198 presence of population, skills, and of public opinion ~~without~~, to make some improvement
199 in their small estates. It may be relevant to point out that this was the time when agricultural prices and declining farm rents. Infact the time was not for all when some
200 farms would not find a tenant at any price.

TABLE 7

Farm:	c. 1875/80	c. 1880/90
Meaisten	£130	£40
Mangerton	£150	£65
Ardtoe & Corrach	£285	£240
Glengarry	£100	£80 (1)
Lochaber	£340	£270 (2)

Notes: (1) Small reduction for enlargement in Glebe.
(2) £12 reduction for Lainemadder and Grimerata Lodge.

The crofters of south Uig were in particular difficulty at this time for here fishing
201 was not a viable alternative. Lack of harbourage, the distance from markets (Stornoway in 1918
202 Tarbert and Kilbrae, had Glenelg families, James of Shaw sharing crofts with Gillies
203 tenants), and three of squatters, i.e. on the common pasture. Here fishing had almost
204 ceased and the people were almost entirely dependent on their crofts or on employment away
205 from home. In Valtos and Kneep there were 21 cottar families: they had 21 crofts and
206 21 cottars. Valtos was a village of 21 families, Kneep of 14 families, Kneep was a village
207 of fishermen and weaving was developed in both Sig earlier than in most parts of Lewis. As
208 early as 1900 Uig was classed with Harris, by the local committee of the Congested Dis-
209 tricts Board, as producing a superior quality of tweed. Of the 1000 people in Valtos and
210 Kneep, 500 were weavers, 200 were fishermen, 200 were crofters and 100 were men who
211 went to the U.S.A. also made grants for roads, footpaths and "marine works"
212 Enough for labor the year at Valtos (1897) was an attempt at a harbour, but it came too late.

The Congested Districts Board was the first government agency with funds at its
213 disposal to aid the crofting township. One of the largest grants went in aid of the Cultivation
214 Society (or Portland Road as it is now known). This scheme across ran of an abortive pro-
215 posal for a railway from Loch Carloway to Stornoway. It was thought that the lands
216 adjacent to the road would be ideal for crofting and that the crofters would be more in
217 clusters and so be the assigned which the fishing vessels returned in any with minimum
218 delay. The road, an excellently engineered one, is still not properly surfaced. A more
219 ambitious C.D.B. called scheme was the establishment of crofters on Sheegarrah Farm.
220 Here a village was built and the land was divided into crofts. Some of the people
221 thereon are buildings were formed here and the first harvest was taken by the new
222 tenants in 1911. The crofters' rent was fixed at £75 and the C.D.B. gave £1000 in grants
223 to purchase the sheep stock and improvements, and towards the cost of fencing. Almost
224 the whole township was fenced and the sheep were kept in a large fenced area. Sheegarrah
225 was a success and its example influenced all Uig. Since most crofters had small holdings
226 needing coordinated schemes were raised by the Crofters Commission where
227 experts regarded the scheme as essentials. Both here since been re-zoned by crofters.

235 Sanford and Harness. but most crofters had less farm-this is one hundred and twenty.
236 Matters are sold at least the place and when the nation is made a fact.

237. Farm of the common pasture - usually the machair, are set aside for wintering hogs
238 and sometimes cattle. Some of the common pasture is arable land. The most so a whole.
239 Not enough of the common pasture is arable to make it worthwhile. Some of the
240 Valtos in Lemreway and one share within a crofter to winter twenty-five hogs
241 and sometimes a few cattle. Some of the common pasture is used for the grazing of
242 the machair - in practice it is the best bigger that are sets. The minister at Timsgarry
243 has a share in the common pasture and winters twenty-five hogs and cattle. Not
244 crossing the Stornoway Stadhlaigh with Seaforths and hence seem to be very small.
245 the minister is more attentive to his sheep than are many of the crofters, but some local
246 men are interested in their crofts. The lighting percentage, so dependent
247 upon the winter and spring weather, was about 80% in 1959 and this was regarded as good.

248 Enquiries since that date crofts in township but not crofters, have been made
249 because where carry on stock the four townships are understocked according to the total
250 area of the common pasture. Thus in Valtos in Timsgarry approximately 1000 sheep
251 are kept. Crofters have of course by 1959 - the Valtos crofters have sold their sheep
252 some of the figures used for sheep stock were approximate or estimated. Nearly all crofts
253 keep some sheep and hogs are sold to the grazing men.

The rhythm of work on the croft during the year is shown on Figure 16, overleaf.

Part of the hill common west of Crowlista was cultivated until the beginning of the
254 twentieth century and the people were almost entirely dependent on their crofts or on employment away
255 from home. In Valtos and Kneep there were 21 cottar families: they had 21 crofts and
256 21 cottars. Valtos was a village of 21 families, Kneep of 14 families, Kneep was a village
257 of fishermen and weaving was developed in South Sig earlier than in most parts of Lewis. As
258 early as 1900 Uig was classed with Harris, by the local committee of the Congested Dis-
259 tricts Board, as producing a superior quality of tweed. Of the 1000 people in Valtos and
260 Kneep, 500 were weavers, 200 were fishermen, 200 were crofters and 100 were men who
261 went to the U.S.A. also made grants for roads, footpaths and "marine works"
262 Enough for labor the year at Valtos (1897) was an attempt at a harbour, but it came too late.

Of the 1000 people in Valtos and Kneep, 500 were weavers, 200 were fishermen, 200 were crofters and 100 were men who went to the U.S.A. also made grants for roads, footpaths and "marine works" Enough for labor the year at Valtos (1897) was an attempt at a harbour, but it came too late.

263 It is obvious that crofting no longer affords a livelihood to Ardtoe. the only two families
264 without ancillary occupations are those where all the members are aldefly. Of the others
265 some are employed in the weaving trade, some in the fishing industry, some in
266 construction capacity at the R.A.F. station and there are fifty regular weavers.

267 Aird and is in a well-contoured township, the land was fully cultivated and a certain
268 amount of cutting was carried on in spite of the difficulty of cleaning up the lands over the
269 rocky beach. Now it is prosperous, the very much dependent on the R.A.F. station, and
270 if this should ever close down, most of the younger people would have to leave in search of other employment.

CHAPTER SEVEN

VALTOS, KNEEP AND EERE

by

David G. Symon.

On the eastern side of the Aird peninsula, facing east to Loch Roag is a township
271 of three villages, Valtos, Kneep and Eere. Valtos is the largest of the three, with 21 families
272 living in 21 houses. Kneep, inclusive of Valtos, Meavaig, Valtos, Valtos, and several
273 smaller islands, comprises the territorial limits of the township of Valtos, Kneep and
274 Eere.

This secondary pastoralism is accidental to the extreme, with outcrops of bare rock and
275 thin soil. Nevertheless it is in this hill land that the Norsemen intense interest was
276 frequently of Uig Bay. The raised roring house and place at Crowlista, and the "port
277 of the Norsemen" at Eere near the site of the Clachan in Crowlista, point to the Norsemen
278 interest in this area.

At present the wearing of Harris tweed from yarn supplied by the Stornoway mills is
279 the main occupation of the people. There are two mills in Stornoway, one at Tarbert, another
280 three in Timsgarry and two (plus one other weaver) in Crowlista. All these towns were
281 in use and two tweeds were in a weak loving in a semi-crofted way for the supply of weaving is
282 irregular. The future security of these weavers depends on the prosperity of the Harris
283 tweed industry.

Machair's sand and gravel quarry at Carnish provides employment for from three to
284 five men. Some of the men are from Crowlista and are from Crowlista. Carnish is growing
285 in size. Some of the men are from Crowlista, one from Crowlista, one from Kneep, one from
286 Valtos. Some of the men are from Crowlista, one from Kneep, one from Valtos, one from
287 Valtos. Some of the men are from Crowlista, one from Kneep, one from Valtos, one from
288 Valtos. Some of the men are from Crowlista, one from Kneep, one from Valtos, one from

pulled out of Lewis to go south to Harris, 159
offered—such was the character of the man—as thanks for 175*
'98 per cent support' he got from the people of Lewis, to each 423
vis crofter his own croft as a free gift, and the Lews Castle, 431
ether with all his property in Stornoway, to the people of the
n.

n 1919, Leverhulme became proprietor of Harris, and con- 159
trated his efforts in Obbe, now called Leverburgh, in South 175*
rris. The harbour at Obbe lacked the natural advantage which
rnoway had, so he spent large sums on making it navigable. [503]
cky obstacles were blasted away; numerous buoys and beacons [228]
e set up to guide vessels into harbour; new quays were built;
l kippering sheds, and other buildings necessary for packing
l curing herring were erected. Among his other undertakings [288]
Harris were the provision of a mill for making tweeds, and he [491]
e half the cost of the 5½ miles of road between Leverburgh
l Finsbay. In 1925, after a visit to the Congo, he died in Brus-
. His Harris schemes came to an abrupt end. And the remains
industrial history are still to be seen in the quietness of the
e township named after one of the most stormy of business
rels that Britain has ever seen.

urism

Tourism has always been a perfunctory and casual affair, until 484
introduction of the fast ferries which now link the mainland [501]
a Skye) with the Outer Isles. Some 10,000 cars cross each year [505]
m Skye to the Hebrides. In 1913, the Stornoway Tourist
ociation had a struggle to increase the number of visitors to
town, to establish it as a tourist resort. It is much the same
lay with the Western Isles Tourist Association, which is having
ficulty in integrating tourist facilities with crofting activities. In
wis, the Stornoway Trust has assisted in establishing pony-
kking, a venture which has the potential to mirror the success
a similar one in the Isle of Skye.

PRESENT INDUSTRY

most an echo of the kelp-burning industry is the alginate in- 824
stry. It provides employment for only small numbers, but is a 381

[Seforthhe-1] [Shielderniah] [Habost]

suppression of the original townships opposed to six today. As a result, many lazy-beds, now given over to natural grass, are being gradually encroached on by heather and juncus. Out of the present population of twenty, three, one is permanently away and two have migrated since 1939. There is a more healthy population structure, with a large number of males between 15 and 44, due to a large family having returned home and six children, five of school age.

In Seaforthhead and Shielderniah all settlement is below the road and house-sites are on slight elevations. At Seaforthhead is the reputed hunting lodge of the Seaforth's, 'Seaforth Castle', now ruined, but still showing signs of abnormal size and arrangement. When first settled, communication was by ferry (1820). Now a cart-track, deeply rutted, to Eisean Lodge gives access to the Tarbert-Stornoway road two-and-a-half miles away.

SHILDERNISH

Shielderniah, also consisting of three crofts, is better situated on the Park and South Lochs road. The three houses are situated on a well-drained northerly slope, half-way between the road and the shore, but the three crofts are on better land and greater accessibility has led to better management and new ideas.

Cultivation in isolated patches reaches up to nearly 100 feet and the lazy-beds have been put together to permit ploughing by horse or tractor. One croft grows neither oats nor potatoes, preferring to enclose two one-acre parks, re-seed them, cut the hay in June, and water the lambs on the aftermath. By next year, this crofter hopes to have enclosed and re-seeded a further acre and will then use the three in rotation. The other two crofts grow both oats and potatoes and one is also sowing down. The crofts average fourteen acres in size but although gentle slopes are extensive, the major part of the croft is in permanent pasture. The total stocking of the Shielderniah crofts is below the township average. Fishing is now only for domestic use though there is a small jetty on No. 1. Part-time weaving is performed on two of the six crofts.

The future pattern would appear to progress to more grazing and less cultivation. Two out of the six crofts - both at Seaforthhead - are worked from outside the township and this isolated township, being difficult of access and having little cultivable land, is better suited to grazing. Shielderniah appears more suitable for enclosing parks for fattening lambs, as soils are deeper and slopes gentler, making the use of a tractor feasible. More could be got out of the croft especially with fertilising and re-seeding for hay and pasture and growing fodder crops for wintering. It is hoped to fence the common securely, and then stock will be improved - a great necessity. Daily communication with Stornoway also means that fresh fish is better placed than Seaforthhead for a fishering settlement. The crofts are certainly of a workable size - provided part-time work, such as weaving, is maintained, along with the grants from the Crofter's Commission.

HABOST

Rachel A Hirst

Habost is scattered around a small bay on the south shore of Loch Erisort. Settlement stretches for over a mile eastwards on three small hills separated by wide, well-drained valleys which soon rise to the dominating Craigeal (225 feet). Slopes are varied but tend to flatten out at about 100 feet near the road and on the flats, most of the cultivation takes place. Nearer the shore, slopes are much steeper and on the hills there are bare rock faces and thin soils.

[Habost]

Drift is found near the shore and taps round the three hills nearly up to the road, predominantly heavy clay with small boulders; this is replaced above the road by peaty loam on rock. At one time, here was grawn on the heavy drift. There is peat accumulation on the flat land near the road to a depth of about six feet and there are one or two peat banks in former years when he had used the spade. The answer to this was given by one of the other pioneers, who thought that time saved could be devoted to some other profitable occupation, for example, weaving. Six of the crofters practise a five-year crop rotation, sowing potatoes first, followed by oats under-sown with clover which for the following three years is cut for hay.

An interesting experiment has been that of the improvement of two-acre of common grazing land by the road on the west side of the township, by sixty tons of lime and fertilisers, spread during the evenings. The work began early in Spring when 6 tons of lime, 10 cwts. of mineral phosphate and 5 cwts. of sulphate of ammonia fertilizer were spread at the owners' own cost. The grass seed was sown in July, the most favourable time for sowing since there is less danger of a drought than earlier in the year, and more convenient for the crofters who have to be born in March so that they are six months old in October for the Garyvard sales. The cows are served by an Aberdeen-Angus bull from Croibeg Farm. The township gaigs are opened in October and the cattle remain within the bounds until May. An interesting regulation enforced by the Grazings Committee is that each family can have only one dog, and that it cannot be taken on to the Common grazing without special permission, or on task days.

Shielings, situated on the common grazing between Calbost and Cromore, were used until the 1890's. Active land was not considered, and was gradually declined; in the 1920's, much of the moss was used at Balallan. Prices for calves are normally better in Spring than at the Autumn sale, nevertheless prices could be expected to be low. Even so, it is usually a profitable venture for a crofter to part with the animal rather than bear the cost of taking it back to the croft and wintering it there. Naturally there is some uneasiness in the community at the suggestion that the middlemen who buy these animals will sell them at much higher prices on the mainland at Dingwall. Sheep are normally sold in Stornoway to the butchers but also at the local sales.

Crofting is not in itself a lucrative form of employment and in most households there is at least one other source of income. A majority of the crofters have regular employment, two working in quarries or on the roads for the County Council, another is postman, three are weavers, another is both weaver and contractor, while yet another works in Aberdeen waters aboard a fishing factory ship for eight months of the year. Weaving is undoubtedly the most lucrative of the ancillary occupations, though the weavers are suffering at the moment from the slump in the Harris Tweed industry which is also affecting the prices for wool. Contracting is also a paying proposition for one or two persons only, since the amount of freight is obviously limited.

Most crofters own a small rowing boat and it is not uncommon to see half a dozen nets set in Loch Erisort on any fine evening during the Spring and Summer for the catching of sea trout, largely because of the scarcity of fish near the coasts, and partly because of the isolation of the area and the enhanced difficulty in marketing. The Fleetwood trawlers are regarded as pirates in the Minch, and one has to re-credit the destruction of two long lines - the sum total of the tackle belonging to a local boat. To have eighteen pounds worth of gear lost in one night is ruin to a crofter-fisherman. Lobster fishing has died out at Garyvard though it could be quite epsteinively practised.

The main road from South Lochs to Stornoway through the village has obviously had a profound effect on the township. The sites of the old 'black houses' have been abandoned when new houses have been built, in favour of sites conveniently near to the road. The Road Age has greatly lessened the distance and time taken to reach Stornoway. Cultivation has not been the majority of crofters in Garyvard use artificial fertilisers, whereas they are scarcely used at all in Caverata where the road ends about 50 yards from the nearest house.

[Garyvard]

Only a fraction of the total arable land is cultivated by tractor and this is divided among seven crofts. In spite of an emphatic statement by one of these cultivators to the effect that he will never use it again, the use of the tractor will increase as soon as the pioneers are able to prove to their neighbours its capabilities and as soon as the lazy-beds are joined together, an improvement which has already taken place in Habost. The main objection to the use of the tractor for the smaller crofts is that the inevitable one that the yields were always lower than in former years when he had used the spade. The answer to this was given by one of the other pioneers, who thought that time saved could be devoted to some other profitable occupation, for example, weaving. Six of the crofters practise a five-year crop rotation, sowing potatoes first, followed by oats under-sown with clover which for the following three years is cut for hay.

An interesting experiment has been that of the improvement of two-acre of common grazing land by the road on the west side of the township, by sixty tons of lime and fertilisers, spread during the evenings. Even so, it is usually a profitable venture for a crofter to part with the animal rather than bear the cost of taking it back to the croft and wintering it there. Naturally there is some uneasiness in the community at the suggestion that the middlemen who buy these animals will sell them at much higher prices on the mainland at Dingwall. Sheep are normally sold in Stornoway to the butchers but also at the local sales.

Crofting is not in itself a lucrative form of employment and in most households there is at least one other source of income. A majority of the crofters have regular employment, two working in quarries or on the roads for the County Council, another is postman, three are weavers, another is both weaver and contractor, while yet another works in Aberdeen waters aboard a fishing factory ship for eight months of the year. Weaving is undoubtedly the most lucrative of the ancillary occupations, though the weavers are suffering at the moment from the slump in the Harris Tweed industry which is also affecting the prices for wool. Contracting is also a paying proposition for one or two persons only, since the amount of freight is obviously limited.

Most crofters own a small rowing boat and it is not uncommon to see half a dozen nets set in Loch Erisort on any fine evening during the Spring and Summer for the catching of sea trout, largely because of the scarcity of fish near the coasts, and partly because of the isolation of the area and the enhanced difficulty in marketing. The Fleetwood trawlers are regarded as pirates in the Minch, and one has to re-credit the destruction of two long lines - the sum total of the tackle belonging to a local boat. To have eighteen pounds worth of gear lost in one night is ruin to a crofter-fisherman. Lobster fishing has died out at Garyvard though it could be quite epsteinively practised.

The main road from South Lochs to Stornoway through the village has obviously had a profound effect on the township. The sites of the old 'black houses' have been abandoned when new houses have been built, in favour of sites conveniently near to the road. The Road Age has greatly lessened the distance and time taken to reach Stornoway. Cultivation has not been the majority of crofters in Garyvard use artificial fertilisers, whereas they are scarcely used at all in Caverata where the road ends about 50 yards from the nearest house.

[Cromore]

The crofters sowed

clover with their oats in 1957; the quality of most of the natural grass could be improved considerably by extending this practise. Several of the crofters have taken advantage of the facilities for obtaining lime and fertilisers, but seaweed and byre manure are widely used. Only seven crofts have cultivated since this year but that of No. 23, (partially enclosed by a dry-stone wall) has produced crops of lettuce, cabbage, turnips and carrots.

The scouring for Cromore is one cow, one heifer and eight sheep per £1 rental, but is not enforced. The crofters keep the sheep which they can manage to maintain through the winter and no one appeared to be dissatisfied with this arrangement. In fact the scouring is exceeded by only seven crofters and the total stock for the township is only 75 per cent of the scour. Lambing takes place in April and May and often a high proportion of ewes and lambs is lost. The sheep are clipped in July and each crofter usually clips his own sheep. He either sells the fleece or has it spun in Stornoway before weaving it himself. The lambs are taken from the ewes during the second week of August and then dipped; November is the tupping period and almost every crofter had his own ram. The cattle are left to graze on the hill all the year round. The crofters like the calves to be born in March so that they are six months old in October for the Garyvard sales. The cows are served by an Aberdeen-Angus bull from Croibeg Farm. The township gaigs are opened in October and the cattle remain within the bounds until May. An interesting regulation enforced by the Grazings Committee is that each family can have only one dog, and that it cannot be taken on to the Common grazing without special permission, or on task days.

MARIVIG

Pamela Gough, B.A.

Marivig is situated on the western and south-eastern sides of Loch Marivig, a small triangular inlet opening to the north-east and well sheltered from storms and swells by Torray Island, making the loch ideal anchorage and harbour.

The land rises steeply from the shore of the loch for twenty-five feet to fifty feet, then slopes more gradually and irregularly, with frequent precipitous rock outcrops, for two hundred to five hundred yards to the rise steeply to a line of low hills, two hundred and fifty feet to four hundred feet high, surrounding the loch. All crofts thus have an easterly or north-easterly aspect, not particularly favourable for cultivation, and only one has any appreciable area of land uninterrupted by rock outcrops. Soils, derived from glacial drift, are unevenly distributed, thin, and very stony, and cultivable areas are thus small and widely dispersed.

The surrounding hills, which form part of the eight hundred and sixty-three acres of common grazing, are mainly covered with heather, moor grass or sphagnum bog, while the lower areas within the township are grassy, but drainage is poor, and rushes are widespread. Bracken is not yet a problem, and only small areas exist, mainly on the lower slopes of the western side of the loch. A few swans and willowe survive here also, but otherwise the area is devoid of cover.

There are twenty-four registered crofts in Marivig, twenty-two being inhabited, one vacant and one occupied by a bachelor who has never lived on the croft. Holdings vary in size from one acre of two crofts, one of which is on the common, all the boundaries run from the township dyke, which closely follows the two hundred foot contour, to the sea in radial fashion (Fig. 4). The size of the crofts varies from 1.25 acres to 22.25 acres but only seven crofts and less than four or more than eight acres in size. No croft has more than three acres of land which has ever been cultivated, and few cultivate more than one acre. There are thirteen cottars and squatters, five houses being on the common, three of them cultivating small areas adjacent to their houses.

Cultivation is exclusively by spade on the 'lazy-bed' system. Owing to the rocky nature of the terrain, the 'lazy-beds' are narrow, often only one or two yards wide. Potatoes and oats are grown in rotation, and hay taken from lazy beds left fallow. Very few crofters now grass for hay or underwrite their crops. Dung and seaweed are used as fertilisers, with potash fertilizer as the most general 'artificial'. Small enclosed gardens, often somewhat neglected, produce lettuce, carrots, cabbage and soft fruits on about half the crofts, but no garden produce is marketed.

[Ur-vir] [Marivig]

beds are now covered by sphagnum moss and heather. Other lazy-beds are permanently immature and, only thirty per cent of the land classified as 'mid arable' is now in use and potatoes. If natural hay is added, one hundred and thirteen acres of crops are taken from an area greater than the so-called old arable; this suggests that the cultivated area was pushed beyond the limits of the old arable (ninety acres) after 1850-52. As in all the fishing townships the area of sown grass is infinitesimal for only the four of the fifty-eight operative units actually have a grass ley. The wintering capacity of the crofts could be greatly increased by the general adoption of the practice of under-sowing.

There are forty-three legal crofts in Gravir but nine are sub-let, in every case to relatives. All the crofts are taken up and there is evident pressure of population on the land. In addition to the crofts, there are a further ten cottars, and squatters and four landless families (legal). Glengravir crofts (ten operative units) share in the Gravir common and the population has been encroached on by several feus for Gravir is the functional centre of Park: the Free Church of Scotland and Manse, the Hospital, one of the two district nurses and two of the missionary (assistant ministers) are all located in Gravir.

Gravir and Glengravir then have fifty-eight legal crofts and fifty-six operative units. Less than half of the crofts with grazing rights are fully stocked; the quarter has stocked the quarter has stocked the other fifty per cent of the scour, including five without any stock. The common pasture of 6,652 acres is in general of poor grazing quality, dominated by the less nutritious species of grass and poorly drained. In 1957 a ten acre plot was fenced and re-seeded; only twelve of the operative units participated in this reclamation work, and the ages of the participants ranged between 27 and 64 years. Besides the fifteen legal Glengravir crofts (ten operative units) all share in the Gravir common.

Crofts can be extended only if adjacent to arable land, which can be easily or not such work. This scheme could be extended annually; if potential improvements to the crofts are limited, pasture amelioration is virtually impossible. Only a few crofts have arable land which could stable better stock to be kept rather than greater numbers; at present the sheep stock is over two hundred per cent of the sheep scour, and a few are taken out for sale at a little at £2 the to £3 10s. an indication of the consequence of overstocking. The cattle stock is below the scouring and this paucity of cattle is one of the notable changes in the agricultural culture since the 1930's for at that time as many as six cattle were kept on the larger crofts. The total stock kept in Gravir and Glengravir exceeds the scouring by thirty-five per cent.

The great majority of the crofts can certainly not be considered economic units. Crofts with the scouring of one cow and follower and eight sheep per pound sterling of rent in a township where sufficient arable land is available to be used for the production of feed for the supporting agricultural units. The produce of two cows and sixteen sheep, with potatoes, and in former days, barley or oats, locally milled by the three Gravir water mills, could scarcely ever have maintained a family. Fishing was the complementary economic activity, and in 1901 no fewer than nineteen boats and eighty-nine lobsters were registered at Gravir. Today, only one boat fishes commercially for inshore fishery.

If agriculture is singularly unrewarding, weaving occupies six of the males of insurable age on service occupations a further ten males and five females, but neither weaving nor service occupations are sufficiently available or attractive to keep the insurable population in the district. Twelve of the males between fifteen and sixty-four years take seasonal employment and forty-six are in permanent employment forty of them in Lewis, in all sixty per cent of the potential male reserve population.

The economic problem of Gravir, in common with the other 'fishing' townships, became acute after the fishing industry collapsed after 1914; in the bay-day of the fishing most of the men fished all the year round, locally and on the west and east coast of Scotland. Earnings fluctuated but a man might make as much as £90 in a good year or as little as £5 in a poor year. Apart from the of young cattle, and wool surplus to home spinning requirements, the fishing earnings constituted the bulk of the croft income. Today, on the basis of the scouring, the income of the largest croft including subsidies could only be approximately £150 excluding the amount to be set aside for home consumption of potatoes and milk.

[Zevric] [Dingravric] [Lamrovy]

The urgent need in Grantir is a reduction in the number of holdings. A pre-requisite of such a reduction would be the creation of a new centre with a sizeable population. Weaving and fishing are the more obvious occupations; the former is subject to world trade fluctuations but the latter is now in a more favourable position since the introduction of the having fishing guaranteed markets, although the raising of the initial capital for buying and equipping boats is a formidable problem. Of the present population there is a large number of young and non-existing. The outstanding feature of the present-day population is the absence of young people. The urgent need for this present trend is that the migrating section of the community comprises the younger and more enterprising people. Unless holdings of economic size can be found, and stable employment introduced, one can expect the younger men and women to remain in Grantir.

Until a major reorganisation of the croftin is carried out, a vigorous attempt to re-send large areas of the common pasture to the former arable condition, and the development of a viable tourist industry, are interim possibilities. It is not sufficiently realised in croafting districts that there is a demand from the city dweller for unspoiled countryside and good plain fare in a clean atmosphere, with the possibility of hill walking and fishing on fresh and salt water. Yet, until the proposed water-scheme becomes a reality, tourism on a moderate scale can hardly be contemplated.

One can only conclude that until reorganisation takes place and transformer Grantir into a township of viable agricultural holdings, and provision of the harvest outside is not of the question, a decline in the number of holdings is inevitable in the long run but a planned reduction over a number of years would bring about a more stable community than the disintegration which will occur without such planning. Until this is achieved, the young men and women have little incentive to remain in Grantir.

LEMERWAY

Beth Bioweyn, Brenda G. Turner and John E. Wearmouth

Lemreway, the southernmost township of Park, comprises 290 acres arable and moiron divided into thirty-three croafts and 3,325 acres of common pasture. The township is situated on the northeast side of Loch Shell round a bay in the shelter of Eilean Isward.

The township consists of three distinct areas. A flat, poorly drained area of about 100 feet, percommon pasture and part restricted to crofters, is bounded by a rocky knoll, the Dotard Corrie, to the first subdivision. The second area, further west, is of a hummocky nature. To the east, a steep rises to an altitude of 400 feet, less than half a mile inch distant. Tumbledown dykes and Two benches are to be seen at about 100 feet on the steeper slope and similar, though wider terraces occur at the same height to the north. It is suggested that the flat area is the bed of a shallow-drained lake, and that the hummocky sector is partly moraine and partly ice-eroded rock exposure. A channel eroded through this sector allowed the lake to drain southwards leaving a relatively deep; incised valley through which the present stream flows to the sea.

Soils may be divided into two types: a peaty loam over the lower and better drained gravelly loam which is found to the east and along the main stream; the latter is particularly suitable for potato cultivation.

Except on rocky outcrops, the very steep slopes and the drained areas, blanket bog predominate. Sphagnum here is rarely dominant but where the land is badly drained Deer's hair grass (Scirpus cespitosus) and cotton grass (Eriophorum vaginatum and Eriophorum angustifolium) are the dominants. On slightly drier land,purple moor grass (Molinia caerulea) and red grass (Agrostis stricta) are abundant. Local dominants are bog asphodel (Narthecium ossifragum) and cross-leaved heather (Erica tetralix) with other common species such as the sundews (Drosera rotundifolia and intermedia),butterwort (Pinguicula vulgaris), Junior sp., Carex sp. and Carex panicea occurring sporadically. Where the peat has been cut and drained, heather most usually develops and Calluna

[Lamrovy] [Grisaig]

The West Highland Grantir Township Croft Association (Grisaig) is predominantly a fishing township. The remains of an old camp site are visible today and wood 1747 dated metal detector survey, indicate Lamrovy to be the oldest of the Grantir townships. Lamrovy has been occupied for more than 200 years but was hard hit by the clearances of the nineteenth century. Today there is one fishing boat which lands its catch in Moreforer working with modern equipment, drift and ring nets, it provides a regular income for a crew of six.

An examination of the population statistics proves interesting, especially when compared with those for Grisaig. Lamrovy's resident population of just over 70 males and 70 females is large considering that there are six unoccupied croafts. Eleven of the croafts have gone than one house and the cofter population forms over a third of the total population. Of the total population 15 are under 15 years of age and 15 are over 65 years of age. Only 15 are between 15 and 65. With over forty resident under the working age group, Lamrovy provides a striking contrast to other croafting townships in Park.

Fourteen of these men are full-time croft workers, while nine others find work in ancillary occupations such as weaving and fishing. A further eight are retired men who, while not regarded employment - a postmaster and a postman, a bus driver, a lorry driver and several weavers. Just over thirty people work away from the township permanently, fourteen in the Merchant Navy and nine girls in domestic service, while a further nine engage in seasonal work.

Contrasts from the township of Grisaig are striking. Only one man is working away from the township. Nevertheless, Lamrovy has a larger proportionate resident population than most townships.

Only four thatched houses are occupied and housing conditions are generally good. Every house has electricity, but, with four exceptions, water has to be carried from springs and wells. Most of the present houses were constructed in the last twenty years. Lamrovy has no croft houses. Two croafts are occupied by men who are retired from the trades, and these were built either along the shore or up the slope to the shelter of the hills where the house was near the sheep, the peat and the springs. Today supplies of food, peat and even seaweed are brought by road.

Mention must be made of the possibilities of the tourist trade in Lamrowey with its most attractive situation and reasonable road communications. An approach has been made to the Scottish Youth Hostels Association and while hostellers could not greatly increase the income of the residents, the hostel would be a good centre for those who wished to explore the surrounding hills. Less than relative to the croafters, it should be noted that it is more than at least three houses could be used.

It is possible to be optimistic about the future of Lamrowey, as at the moment considerable enterprise is being shown. A Ferguson tractor, bought this year by a man returning from wining. I am example. It is to be hoped not and could be put to good use by some enterprising croafter. There is also interest. The attempt to improve the common pasture and the new extensions to newly planted house are all indicative of considerable enterprise in croafting. The old women, though not regarded as employment, are a valuable asset to croafting community, for they take care of the young children while their mothers are being employed in outdoor work and croafter-weaver, croafter-postman and croafter-bus driver are the contemporary employment combinations.

The pessimism and apathy noticed in many croafters is to be found in Lamrowey but above this is the impression of enterprise. If the croafters can continue to adapt itself to changing conditions, it may be able to combat the 'drift to Glasgow' and continue as a successful community.

ORINSAY

Beth Bioweyn, Brenda Turner and John Wearmouth

Orinsay is a small croafting township clustered, in the form of a horseshoe, around the head of a sheltered bay on the northern side of Loch Shell. Most of the houses are situated within fifty yards of the shore on a narrow strip of land, beyond which, the croft extend from the shore on to the moor

1. The Directors of the Croafting Survey are grateful to Dr. F. Fraser Darling for granting access to the individual Township Cards, which are a storehouse of information. For detailed contents of the cards, see West Highland Survey p. 247.

Recent trends also point to a decline in the numbers of sheep, although more are kept now than fifteen years ago. Some of the croafters have lost their sheep stock (243-345). A great deal of hard work and money have been a result of the own subsidy, but part at least may be connected with the sea and part may have been due to the fact that the sheep stock could not be expanded. Today there is one fishing boat which lands its catch in Moreforer working with modern equipment, drift and ring nets, it provides a regular income for a crew of six.

All the croafters keep some sheep although individual stocks vary from 15 to 150. For most of the year these sheep are grazed on the common pasture on the moor or on the sightseen area (island in the bay. In August, however, the lambs are gathered in for weaning and dipping. In November the gates are opened and all the sheep allowed to graze on the clearer pasture within the croft. Ewes are brought into the working age group. Lamrowey provides a striking contrast to other croafting townships in Park.

The total area of the common pasture, which is mainly heather, the most of it consists of hummocky, waterlogged and stony ground, supporting only poor quality coarse grasses and sedges. Over 700 sheep are grazed this area and the carrying capacity of the common pasture is certainly drastically over-stocked, with an improvement in drainage, one might be used in the two valleys.

It is not an easy to be optimistic about the future of Orinsay. The population resulting from the clearances of the nineteenth century has continued in the fishing industry could absorb most of the men. A great deal of hard work and money have been a result of the own subsidy, but part at least may be connected with the sea and part may have been due to the fact that the sheep stock could not be expanded. Today there is one fishing boat which lands its catch in Moreforer working with modern equipment, drift and ring nets, it provides a regular income for a crew of six.

It can be appreciated that crofts of this size and quality can neither provide the croafter and his family with sufficient income, nor fully occupy the croafter's time. The Highland Survey describes Orinsay as "primarily a fishing township". Today the fishing has ceased to be a major occupation, and only one croafter still does a little inshore fishing, sending his catch direct to Stillingsgate.

There are now 45 people resident in Orinsay but an examination of their ages reveals that less than half of them are between 15 and 64 years. Least there are only six resident males between these ages, and three of these spend at least part of their working away from the township in the Merchant Navy.

As there is neither a school, post office, shopsor garage in Orinsey, there is no available employment in the 'service trades'. Therefore, over half the population between the ages of 15 and 64 are at present in the electrical Board, employed in the Merchant Navy, or working for relatives, while another third are seasonally away with the whelkers. Only one man is employed in the Forestry Commission. These figures, of 1956 and 1957, indicate that they have already investigated many of the possibilities for development. Only one croafter is employed in croafting, but he could be employed for much more than croafting, in fact, he is employed in the Merchant Navy and consequently, the Crofting Area as a whole can be

The district of Park is one of the more isolated and difficult crafting environments. The ruggedness of the terrain, the poor communications, the lack of employment opportunities and the consequent absence of a nucleus of business communities prevention. In addition, many of the crofters have to be prepared to accept the existence of human communities. The population of the Crofting Area of Lamrowey, and the original small settlements grew rapidly as a result of changes in land use which was a natural trend - the conversion of the clearer areas in Park in the form of the creation of a large body of small farmers in favour of an extension of the grazing area. Thus the present conditions are a legacy of the relatively recent past, and of legislation, particularly in the Crofters' Act of 1886, which accepted, and partly agreed to the maintenance of a larger population than the land could reasonably carry[1]. Two World Wars and fluctuating economic factors have had repercussions in Park and resulted in a change in economic and social values, and depopulation has resulted: the 1951 population was 60 per cent of the 1911 total.

1. The Commissioners proposed that only holdings rented at £6 and over should have security of tenure, with a view to discouraging the perpetuation of grossly uneconomic holdings: in the Act, all holdings were given security of tenure.

[Orinsay]

The future existence of the common pasture and croafting is being seriously endangered by encroachment, by bracken and scrub, and by the sheep. The actual sheep stock exceeds the room by 300 per cent. Peat-cutting is gradually destroying valuable grazing areas; in the last three years there has even been some peat cutting on the better grazing land on the island. The dangers both of overstocking and of indiscriminate peat cutting cannot be overstressed.

No statistics are available to show the extent of the decline in the quality of the common pasture. The establishment of shelter belts would provide not only shelter but a means of stopping the peat from 'slumping' down slopes if they were carefully sited. Much of the common pasture could be improved by both drainage scheme and by re-seeding, after sanding and liming, a project well within the capacity of the resident labour force.

Good crops on a few of the croafts suggest that the land is not inherently sterile, however, and it would seem that if the holdings were reduced to a maximum of four, an economic existence might be feasible on these croafts. The steep nature of the soil limits the possibilities of tractor cultivation, but with an improvement in drainage, one might be used in the two valleys.

No pigs or horses are to be found in the township and each croafter keeps very few hens, normally only a few dozen. Egg production is not a major occupation. Any surplus eggs which do not lay are sold on the Co-operative van, but prices are so low that the keeping of more than a dozen hens is far from profitable.

It can be appreciated that crofts of this size and quality can neither provide the croafter and his family with sufficient income, nor fully occupy the croafter's time. The Highland Survey describes Orinsay as "primarily a fishing township". Today the fishing has ceased to be a major occupation, and only one croafter still does a little inshore fishing, sending his catch direct to Billingsgate.

SUMMARY AND CONCLUSIONS

The aim of the Glasgow University Department of Geography Croafting Survey is to record and interpret all material relevant to the croafting districts, and in so doing provide a clear and impartial statement of the problems of croafting. The Survey has been concerned with the Island of Park, the Parish Association hoped that a body of fact would be assembled and conclusions drawn which would assist the croafter in his struggle to maintain and develop the well-being of the crofts. These two Preliminary Reports, of 1956 and 1957, indicate that they have already investigated many of the possibilities for development. Only one croafter is employed in croafting, but he could be employed for much more than croafting, in fact, he is employed in the Merchant Navy and consequently, the Crofting Area as a whole can be

As far as the land is concerned, the survey leaves no doubt that improvements in husbandry and pastures are definitely possible. Yet, until viable agricultural units have been created, there is little incentive for large scale improvement in either sphere. It is an esoteric opinion that no croafter working on a croft in Park which would bring in £300 a year would have time to engage in ancillary work and at the same time fully work his holding in accordance with the rules of good husbandry. If this opinion is accepted, and it is also accepted that such crofts are desirable and the present crofters are the only agricultural township where there is a higher proportion of full-time crofters than elsewhere would bear the out, it follows that ancillary employment on such units would have to be found on

1. Park Association Annual Report, 1956.

finally scrapped for ammunition. Drying sheds have been erected at Staffin. Power machinery for extraction has been brought in; a processing plant has been built at Uig with German equipment; and experienced men have been employed.

The industry is admirably suited to the island. The great weight-losing properties of the raw material, the scarcity value of good deposits, and the large commercial demand combine to offset the high cost of transportation from which most export prices suffer. It is estimated by the directors of the company, an English concern, at least that fifty men will eventually be employed in the pit and at the plant. They will be given regular employment, five days a week in three shifts. In addition to building the access road the government, through the Department of Agriculture, has leased the site, and the Inverness County Council has erected subsidized housing at Uig to encourage the venture. When the Secretary of State Presided at the opening of the plant in May, 1954, he spoke of the promise the industry held for the island's future, especially the prospect of regular employment. Up to June, 1954, however, the employment was irregular and limited to sixteen men.

The Skye Tweed Industry. About twenty-five years ago a small weaving and basketry shop was established at Duntulm in Kilmuir. The factor for the Department of Agriculture acted as manager, and the local Church of Scotland minister was the foreman. Later it was taken over by the Highland Home Industries, a cooperative, non-profit corporation.

Highland Home Industries is the result of a union in 1914 of two similar movements begun fifty or sixty years ago by several beneficent women to help the croafters find a market for salable manufactures and reduce their need for dependance on the often exploitive barter system.[1] The Skye workshop has employed eight to ten men and women over the years, plus some who worked at home, but it has never been economic. In 1954 the director, a woman from Edinburgh, was unable to buy material and pay the wages of the four remaining weavers. The old market has disappeared. The shop was unsuccessfully offered for sale in February. Fortunately, a gift from an undisclosed source averted the necessity of closing down.

Only the very old people in Skye can remember when weaving was a household industry. Until the Harris people were settled on Skye at Portnanlong, it must have been a lost art. Today even the Harris folk have given up weaving. They say the purchase tax on luxury, mass woven woolens has destroyed their market. The hand shuttles on one or two looms which are used only move for special orders. The Portree woolen mill, originally established by the Highland Destitution Fund in 1891 and now owned by an east coast corporation, still operates on a limited production schedule. About a dozen village residents are employed regularly, and a few "tinker" girls, daughters of the wandering Highland tinsmiths, find work at the looms.

[1] Alexander Maclehose, The Scotland of Our Sons (London: Alexander Maclehose and Co., 1937), pp. 292-294.

233 Little close attention is paid to shepherding though several crofters profess to liking it. The great losses on the moor (often amounting to one third of the lambs each year) does not seem to cause much worry. The chief income from the sheep is the fleece which sells at up to 4/- per pound, an average fleece weighing from three to four pounds. This wool is not used for the tweed industry since it is too coarse being more suited to carpet manufacture. Appendix C (6) shows that the majority of flocks are small averaging from 10-20. The overgrazing is the result of a smaller number of owners keeping larger flocks. Thirteen of the working units have between 50 and 100 sheep. As to those without sheep, several crofters declared themselves to be too old to bother with them, a fact which serves as an illustration and introduction to the population problems.

Appendices D (1) shows the twofold nature of the difficulties which confront the community. Twenty-two per cent of the residents are over 65 years of age and no less than 56% are over 45 years old. With the sole exception of one man who works on the power development project at Gisla in South Uig, the main focus of employment is local. A small number of people are engaged in services to the community including shopkeeping, but the main source of income is weaving since crofting itself (by definition in this area at least) does not yield sufficient to maintain a family. Yet there are 31 full time crofters who are being supported in some other way, either by relations temporarily or permanently absent or by interest on capital accumulated during periods of employment away from the island.

There is an insufficiency of women of child-bearing age to offer hope of an increase in the population or even a sufficient number to guarantee a level of replacement. This fact toegther with the emphasis on one form of employment gives rise to anxiety among the crofters, who recollect what happened when the fishing finally collapsed during the First World War after a period of steady decline. In 1913 twenty boats sailed from Carloway and gave employment to 295 men. If the weaving fails (at present a weaver making three tweeds per week can earn up to £16 for them) there will be similar hardship and the net emigration from an area already none too attractive to young people will certainly become more marked than it is at present.

Table 36

Fishing in the Carloway District 1892-1956

	Numbers engaged		
	Boats	Men	Value of catch:
1892	65	300	?
1900	27	318	?
1913	20	295	£8,700
1920	14	266	£560
1930	10	83	£262
1938	10	40	£470
1948	14	40	£174
1956	15	18	nil

Note: Boats returned may not have been in regular use; many of the men were mainly engaged as hands on east coast boats.

that the movement of whole families is unusual, although a few have migrated to Stornoway, particularly from the south. In this respect Uig, except to some extent the south, differs from Park; only 15% of emigrants have gone to Stornoway, c.f. 32% from Park.

TABLE 51

The Destination of Emigrants, 1939 - 1959

Destination	Males (No.)	Females (No.)	(1)	Total (No.)	(%)	c.f. Park (%)

All destinations	236	291	(206)	527	(100)	(100)

Notes: (1) The figure in parenthesis under 'females' indicates those who became 'migrants' on marriage.

Male emigrants from Uig go mainly to Glasgow and other parts of the mainland (table 51). Since 1939 (in effect since 1945) only 12% have gone overseas; 16% have moved to Stornoway and a further 10% to other parts of Lewis. This is almost entirely a movement in search of work. Female emigrants from the parish are less widely dispersed: more went to other parts of Lewis and fewer overseas. There is a special factor in the case of female emigrants. Social intercourse between the different island districts is very active, despite the apparent lack of facilities; almost a third of the female emigrants from Uig became migrants on marriage into other Lewis parishes. Even if we discount such migration, more women than men migrated from Uig between 1939 and 1959. Weaving retains young men but not the young women.

Migration from a crofting district is a somewhat indeterminate process. Young people of both sexes go to Glasgow or elsewhere in search of work. For a while they maintain their island homes but, eventually, they set up homes of their own. Our criterion of 'migration', as against (working permanently away', was this setting up of a home. Thus the critical point is often marriage and it will be noted (table 51 and Appendices B(3) and D(3) that a very large proportion of female emigrants appear to have emigrated on marriage; in the case of migration outwith Lewis this usually means that for some time previous to their becoming 'emigrants' they had seasonal or permanent employment away from home. Indeed, our enquiries showed that the great majority of young women who took employment on the mainland eventually married and settled away from Lewis. Only a small minority returned, often giving up their employment in order to care for ageing relatives. An island man may occasionally return with a mainland wife but cases of island girls bringing mainland men to settle in the island are rare indeed.

TABLE 55

Proportion of resident males, aged 15-64, in Major categories of employment

See Appendices B(2) and D(2) for details.

	Croft-work only	Croft-work and weaving	Croft and other regular work	Croft and periodic work	No croft work	Total (100%)
Uig Parish	11	43	16	15	14	(635)
Districts						
South Uig	13	27	22	24	13	(188)
Bernera	8	36	25	19	12	(130)
East Loch Roag	9	50	11	11	19	(146)
Carloway	16	61	6	6	13	(171)

Table 55 and figure 47 summarise the main sources of employment. The small group engaged in 'croft-work only' may be briefly dismissed. A large proportion of these men are elderly or otherwise infirm; a few are pensioners (e.g. retired police or service men); very few indeed are fully occupied in the agricultural work of their crofts, thus 'full-time crofters' is a misnomer in this area.

The most important category, in all districts, is 'croft-work and weaving', but it is relatively far less important in the south where there is correspondingly greater reliance on other forms of regular employment or on periodic work, i.e. casual labour.* It is difficult to overestimate the significance of weaving in all districts. It is the only substantial source of income in the parish and it should be clear from the previous chapter that weaving is not an ancillary occupation to croft work except in a few cases in the south. The weavers are not 'crofter-weavers' so much as 'weaver-crofters'. A curious distinction between Carloway and the rest of the parish is that, whereas generally weaving is young mens' work, the great majority being under 45, in the Carloway area two-thirds of the weavers are over 45. The historical reason for this may be the earlier spread of weaving into Carloway than elsewhere for, although some weaving has always been done throughout the area, it only became a major source of employment south of Carloway in the last 20 years or so. Thus few of the older men in the south learned weaving when they were young. A corollary is greater dependance on the Merchant Navy as a source of employment for young men from Carloway than for those from the south.

Other sources of regular local employment are lobster fishing (Bernera only), gamekeeping and other estate work (Bernera shore and South Uig), and government establishments (South Uig). In addition there are the usual services - postmen, haulage contractors,

* For a detailed discussion of the significance of weaving see Moisley, H.A., Harris Tweed - a growing Highland industry. Economic Geography, 37, 1961, pages 353 - 370.

[TEXT CONTINUED ON PAGE 152]

464 shopkeepers and so on. But none vies with weaving as a source of regular income. Without the weavers most of the others would find little demand for their wares or services.

Periodic work is taken locally, usually in default of regular employment, and often by older men who formerly worked away from home. This is usually casual labour and is particularly important - for lack of other opportunities - in South Uig. Whilst our survey was in progress a number of men from South Uig were thus engaged at the Gisla hydro-electric scheme. In South Uig, also, weaving tends to be less regular than elsewhere. For this some weavers blamed the Stornoway producers, who, it was claimed are not inclined to send work as far out as this unless it cannot otherwise be done. There is some truth in this, particularly with respect to the 'small' (i.e. non-mill) producers, but our observations also showed that some men in South Uig regarded weaving as an 'extra' and were not prepared to do it when alternative employment, on the croft or for wages (as at Gisla), was offered. This may be a vicious spiral - the less weaving a man does the less good he becomes, he takes longer to complete a web and may suffer more deductions for faulty work. He becomes less inclined to weave and the producer becomes less inclined to send him work.

TABLE 56

Permanent Employment away from home (actual numbers)

	Men:			Women:			
	M.N.	Professions:	Others	Nursing:	Professions:	Domestic:	Others
Uig Parish	46	11	63	59	18	39	27
Districts

Bernera	8	4	3	10	1	2	7
East Loch Roag	16	-	23	15	6	15	7
Carloway	22*	3	25	12	5	3	11

* including five working seasonally on whalers.

Those taking permanent employment away from home (table 56) tend to choose particular occupations. Amongst men, the Merchant Navy is most popular, especially from the Carloway and East Loch Roag districts; many of the others work at skilled or semi-skilled jobs, including the police forces; relatively few are un-skilled casual labourers. Amongst women, nursing is by far the most important occupation and is particularly popular amongst young women from South Uig and Bernera; most of ther others take 'domestic work' - in hotels and hospitals, rather than in private homes - and a few work in offices and shops. The category 'professions' in the table is almost synonymous with school-teaching.

Periodical, including seasonal, absence from home is less common than from some island districts; 14% of the 15-64 age-group is classified as "periodically away" (compare 27% from Park, 16% from Harris, 13% from Barra). Of these, half the men and a third of the women are students. Seasonal hotel work, for women, is the most important single category.

Population trends

162 The diagrams, figure 48, summarise much of this chapter. They have been constructed so that the area of each horizontal bar is proportionate to the number of persons in the

000 1) Further depopulation is inevitable but is not necessarily bad. The special privileges of crofting tenure have tended to delay the inevitable because the agricultural structure has been unable to adapt itself to changing circumstances. The land is in some ways less productive than it was 80 years ago. But, as population does decline, eventually more land ought to be available for each remaining family and, if properly used, should enable them to increase the proportion of their incomes derived from agriculture. Thus depopulation could have beneficial effects provided it were not haphazard nor complete. The rate and ultimate extent of depopulation could be controlled to some extent if a realistic assessment of the possibilities of each district were made, followed by a vigourous attempt to realise these possibilities. This must be done locally because the problems and possibilities of each district, sometimes of each township, are different. How can this be done?

288 2) It is not realistic to plan for any extensive development of industry nor for any substantial further development of forestry or fishing. Lewis is suitable for the development of industry - the phenomenal growth of the Harris Tweed industry, with an annual output worth £5 million, much of it for export, is proof enough of that. But when it is difficult to get industrialists to invest in lowland Scotland there is little point in living in perpetual hope in Lewis. To constantly cry, as some politicians do, that 'the government should send industry to Lewis', is not helpful, either, for no government has ever had sufficient power, nor is it desirable that it should have, to force a firm to invest against its will. If there is to be some industrial development it must come willingly; it would be unwise to depend on it. It follows, therefore, that agriculture must be made a more efficient basis, though not the sole basis, of most crofting communities. The present heavy dependence on casual or seasonal employment, and on permanent employment away from home, can never provide the bases for a truly viable community though it may provide a useful outlet for some younger folk. On its present scale it leads to the neglect of the only widespread natural resource, the land, as well as encouraging permanent emigration.

311 433 3) Crofting agriculture, as at present carried on, on most crofts, does not make the best use of the local resources. The land is marginal in many respects and the development of an economic form of agriculture requires:

(a) particular skill in farm management, including initiative and technical ability to take advantage of new materials and methods, and
(b) a marketing system on which the crofter believes he can depend. At present it is the uncertainty, as much as the poverty, of the reward that deters young men from taking up agriculture seriously.

427 4) The small size of holdings need not be a serious disadvantage. Since the time of our survey subletting is no longer necessarily contrary to the conditions of crofting tenure; since it represents a voluntary evolution towards larger holdings it, rather than wholesale reorganisation, should be further encouraged.

5) It should be recognised that if a croft is not properly stocked it cannot justifiably be the subject of any of the privileges of crofting tenure. Failure to maintain a properly balanced stock is damaging to the land and to the ultimate well-being of the community as a whole. At one time the factors, through their ground officers, maintained a degree of control over the stocking of township lands and this could, in some way, be resumed - if not by the proprietors then by the Crofters Commission, - though the best way would be voluntarily, through the township committees. This would depend on establishing soumings which fairly represented the grazing capacity of the township lands; and on restricting the unlimited substitution of sheep for cattle. At present many soumings depend on restatements of old ones the validity of which is very dubious; soumings are unlikely to be respected unless they are reasonable.

181 6) Few crofters possess sufficient technical knowledge and confidence to make the best use of their land. It is particularly difficult for men with such limited resources of land and ready cash to embark on new agricultural enterprises; they are naturally reluctant to take risks and therefore tend to be excessively conservative. This cannot be put right quickly nor so long as the majority of those working the crofts are middle aged or older men who have spent the greater part of their working lives in other occupations. Such men require special help but, above all, some of the younger men must be encouraged to

166 However, not all such
167 employment is available in Park: 47 percent of the insurable male population
464 leave the Hebrides to find employment; one third take seasonal employment, and two-thirds permanent employment furth of Park (See Table VIII).

Employment within Park

288 Table IX shows that opportunities for local employment are strictly limited. Weaving of
466 Harris tweed is the most important single source of employment. It is significant that those engaging in it are almost all crofters working in their abundant spare time. Weaving is an ideal adjunct to croft work as it is unaffected by weather or hours of daylight and thus can be performed during periods of agricultural inactivity. The vagaries of the Harris tweed market make the occupation precarious; Park is one of the more inaccessible areas of Lewis and the mills are apt to give their commissions to the weavers nearer at hand around Stornoway when
[178] work is scarce. Since 1952, the number of weavers in the fishing townships of Cromore, Marivig, Calbost and Gravir has grown from 11 to 22 and much of the credit for this is due to
[228] the activities of the Pairc Association. Fishing, on the other hand, has lost ground in the same period: the number of fishermen has declined in these townships from 20 to 14[1]. Apart from
463 weaving, service occupations form the only other employment available, shop-keeping, driving
464 and road maintenance being the chief occupations in the service group. There are very few craftsmen: with such a small population, and the long established tradition that the crofter builds his house and is his own tradesman, there is little opportunity for a trained builder, joiner or even shoemaker to make a livelihood. The professional class is small and entirely composed of the minister and missionaries, the doctor and several schoolmasters.

[462] There is little opportunity for women to find employment in Park, apart from nursing, shop-keeping and school teaching, and a few domestic service posts (See Table IX).

Employment furth of Park

166 The persons in the 15-44 age group form the main body of those working away from home.
167 The distinction made between 'seasonally away' and 'regularly away' is that the former group
462 spend part of the year elsewhere, the men on whalers in South Georgia or with the Tay Salmon
463 Fisheries at Perth, or labouring on the mainland. The women are in domestic service, mainly
464 in hotels. A majority of the men in the latter category are in the Merchant Navy; in some cases these men take leave to coincide with the spring work and the harvest. The majority of the women are in domestic service (See Tables IX and XI).

An interesting comparison in the 'regularly away' group exists between men and women in the professional classes (Tables IX and XI). The sample is small, but it is clear that more women than men attain professional status. The number of domestic servants, nurses, and merchant seamen is a reminder that the crofting districts provide a pool of labour for certain vital occupations, some none too popular in Britain as a whole. In people alone, one can say that Park makes a distinct contribution to the fabric of the national economy and this contribution is much more apparent outside Park than within the district. At the same time a majority of those who are temporarily or permanently away eventually marry and settle outside the district and thus a most valuable section of the community is constantly moving southwards. Only 35 per cent of the men in the 15-44 age group are wholly resident in Park, and 46 per cent of the women in the same age group, a reflection of the poor prospects and utter inadequacy of resources on the most of the crofts.

1 The 1952 figures are abstracted from the Lewis Survey Report on part of South Lochs.

• 291 The dress of the people has changed. The men commonly wear overalls instead of the fisherman's blue jersey. Till 1919 every woman and girl wore the black petticoat striped with colours, dark blouse, often with stays, and a knitted muffler round her neck and over her head. In summer the tartan shawl was more typical of Sundays than week days (Plate IX). In clothing, a change for the worse preceded a change for the better. The abandonment of homespun, rich in wet-resisting oil, for machine-made cloth was at first a loss; but oilskins, waterproofs, and rubber boots are a surer protection to all on land or sea. For much of the year the women went barefoot but for the *osanan*, worn except in warm weather; these are stockings leaving the sole bare and kept over the foot by a band passing under the middle toes. In a wet climate with much soft ground this was a sensible custom, for wet feet, easily washed, were warm and dry as soon as the women came indoors. They moved hardily, yet a little warily, for fear of stones and, when not fatigued, with a short, springing step which was a pleasure to watch. At the same time their feet were sorely tried by rough heather or stony ground, especially when they were carrying a laden creel. Now nearly all except elderly women wear shoes (or rubbers) and stockings. They have given up the dark, striped full skirt and petticoat worn till 1919 and adopted the skirt and blouse or jumper of the towns, or the short frock so much simplified since Edwardian times. In fine weather the head is bare, though often netted because of the wind.

[369] As dress changes, it is often said that the country copies the town; the reverse were truer, in essentials. By 1914 the townswoman had begun to copy her sister in the country, seeking for common sense and simplicity; and what is true of dress may be true of other things.

178 262 Most of the outward changes which have occurred in the island took place in the two decades just after the first world war. Food, for instance, now tends to be better balanced and contains more nutrients. Staple diets in the past were mostly confined to a few items, and based on the potato. Fish, particularly those with essential oils (eg cod) were, of course, available; but only if the fishermen were lucky in the catch. As for vegetables and fresh fruit, it was not until after the 1920s that these became generally available all the year round.

178 291 Another outward change has been in dress. Until the beginning of the twenties, the women wore a black petticoat striped with colours, a dark blouse, often with stays, and a knitted muffler round the neck and over the head. In summer, the tartan shawl was more typical of Sunday-wear than of weekdays. Men's clothes tended to be of the homespun type, rich in water-resisting oil. Later these were replaced, so far as the fishermen were concerned, with oilskins, waterproofs and rubber boots. Dress nowadays of course tends to conform to what is displayed in magazines, on the film screen and on television.

178 181 The changes in the mental characteristics of a people are not so obvious. Centuries of generations of long-dead forbears have contributed their accretions to the character of the island people today. It is a complex one. Impressions of the island people as such are few, mainly because observers looked for those economic aspects which gave the society its *raison d'être*. That islandfolk of 175 181 former times were fond of music and dancing was the observation of the Rev John Lane Buchanan, who was 'Missionary Minister to the Isles from the Church of Scotland' from 1782 to 1790. In a volume published in 1793, in which he describes his Hebridean experiences, he says that the British laws had been introduced to the Island of Lewis by the Seaforth of that period. [535] The Lewis people, he says, 'since their late happy change from servitude to freedom, by the present noble-minded proprietor, are animated with such life as to meet in companies, regularly each week, at stated places, where both old and young take their turn in this agreeable past-time [dancing], when they exercise themselves with amazing alertness and spirit.' Martin Martin mentions that in his time (*c* 1695) the Lewis people were 'very dextrous in the exercises of swimming, archery, vaulting, or leaping'.

175* 181 in the exercises of swimming, archery, vaulting, or leaping'. He also says that they were great lovers of music, and that when he was in the island he heard of eighteen men who could play the [533] [534] violin well without having been taught.

The Rev William MacRae, minister of Barvas, writing in the *New Statistical Account*, gives a description of his parishioners (in 1836) which can be applied to all the country districts in the island at that time. After stating that in their habits much clean- [515] liness can scarcely be expected, considering their poverty and the wretchedness of their habitations, he says:

> Their mode of living most closely approaches the pastoral: without arts, trade, manufacture, navigation, or literature, their whole round of duty consists in securing fuel, in sowing and reaping their scanty crops, and in rearing their flocks, and tending them at pasture. Yet in these limited circumstances, while supplied with food and clothing of the plainest description, and able to pay their rents, their simple cottages are abodes of happiness and contentment. Blue kelt [a thick cloth] is almost the only dress [291] worn by the men, and stuffs, variously striped, by the women, with under dresses of plaiding, all home-made. In many instances, however, cotton shirts and print gowns are beginning to supersede the use of some of these articles . . . Their ordinary food con- [262] sists of oat and barley meal, potatoes and milk variously prepared. Their domestic economy is frugal and moderate beyond conception. The produce of a foreign soil such as tea, coffee, and sugar, and the common conveniences of art, such as knives, forks, and etc., are to them altogether alien.

It is of interest that the change in dress-types (from woollen [164] homespuns to cotton fabrics) was followed by an increase in the incidence of rheumatism.

Today, the island folk are reputed to be gloomy with a black, 181 depressive attitude towards life. The editor of the *Stornoway Gazette* has pointed out: 'We cannot understand a people and why they act as they do unless we know the content of their memories. We cannot understand the paradox of the naturally gay in heart seeking religious consolation in a grim and gritty Calvinism. We cannot understand why Lewis, which clothes the world in colourful tweeds, clothes most of the women in noth-

286 Make smooth and even the warp of my loom
788 And grant thy blessing, God, on me,
On all who here find shelter and room
539 And dwelling . . .

Thine arm be round each woman here
Who waulks this web of mine,
O aid her in her hour of need . . .

Keep the flock that we may win
Sweet and nourishing milk to drink
And wool to give, to weans and kin,
For wear!

Even now in Harris or the Lews, a brief good wish may be uttered—a "Health and strength to the wearers!" as the perspiring women end the waulking; but in the past the web was finally consecrated. Each of the family who was to wear a portion of it was named by the weaver herself, who led the consecration (*Carmina*, No. 113).

May the well-loved wearer of my web
Never be wounded . . .
May the sanctuary shield of the Lord be his. . . .

286 The significance of this gift of hard-won cloth can now
532 be seen, first for the family but next for the neighbourly
614 team. We can understand how each 'set' or pattern of
[593] tartan stood for the spirit of the family and the group of
[621] kin and homeland, the clan. We conceive what it meant
to the Gael when the tartan, with "the Highland dress
. . . or any part of it whatsoever", was forbidden "to
• [291] any man or boy" in the Highlands. Women were still
allowed to wear it, it was true, but the dress ceased to be
a symbol of community when its wear was confined to
[714] one sex. As a single exception, the Highland dress was
[175] retained for soldiers, but the militarisation of the tartan—
though it seized upon one strand of clanship, that of

286
532 warfare—destroyed its intimate tie with the home, with
614 peace. The web the women had dyed, spun, woven and
714 waulked together ceased to be a sacrament when the tartan
[178] was proscribed to men except when worn as a uniform with
"England's cruel red".
[648] The framers of this law, which stood on the statute
book for over forty years, took full cognisance of what they
175 did. Appended to the Act of 1747 was an oath which
648 reversed every benediction said by the women at their
work: "I . . . do swear, as I shall answer to God at
286 the great day of judgment, I have not, nor shall have, any
• 291 gun, sword, pistol or arm whatever, and never use tartan,
782 plaid or any part of the Highland garb; and if I do,
641 may I be cursed in my undertaking, family and property—
may I never see my wife and children, father, mother,
relations—may I be killed in battle as a coward and be
without Christian burial in a strange land, far from the
graves of my forebears and kindred; may this come across
me if I break my oath". This Act, as law and symbol,
struck full at the sacramental life of family, neighbour-team
and clan community, in which labour and prayer had been
indissolubly bound.[1]

(c) WORSHIP, CONGREGATIONAL AND PERSONAL: THE BOOK AND THE WORD

178 Little remains of the tradition of worship in the tiny
771 oratories, chapels or 'temples' whose ruins stud the shores

[1] The collaboration of friends in Lewis may allow mention of the Gaelic
346 version of A. Geddes, *The Spirit of the Tartan, a Song Drama* (English
172 Version); *Souvenir Programme and Book of Songs* (Outlook Tower, Edin-
burgh, 1932). In this the spirit of this labour sequence embodied in its
[113] songs and runes is dramatised in its setting of custom and history. The Gaelic
version was prepared by the generous labours of James Thomson, M.A.,
Bayble, and the late Duncan Macdonald, M.A., Sandwick, Lewis.

796 given at Christmas; in Lewis, Christmas is identified
431 with Catholicism, and is an insignificant event in
184 comparison with New Year. To give two examples, a New
527 Year's dance is given, but not a Christmas dance; and
796 the mills continue working on Christmas if it occurs
184 on a week day, but close for at least two days at New Year's. In Shawbost, bannag is defined as a party associated with Hogmanay (New Year's eve).

527 In the recent past, until about ten years ago,
• 292 the boys dressed in women's clothes or wore masks. They
178 took turns wearing a cow's skin as they went from house to house. In each house, the boy wearing the skin was
[539] hit by the others as he chanted the rann na bannag (rhyme of the bannag):

Here I come again renewing Christmas.
(Or, in another version: This is the New Year's night.)
I'll take the bread without the butter,
And the butter without the bread,
And the cheese by itself.
Then we won't be empty-handed.
One thing I refuse is a mangy potato.
It gives a heavy feeling.
It's not healthy.
If you don't give me my bit of butter and my lump of cheese,
Everything you possess will be gotten by the crows on St. Patrick's Day.

527 As the balaich na bannagan left the house in which
431 they had received gifts, they blessed it. All food and
178 money was given to the woman who prepared the bannag.
[788] Today children tend to receive money more often than food, and use some of the money to buy sweets at the post

781 conversions that take place in other villages. "Five
571 persons converted recently in Lochs. Two used to drink a lot, they're saying." Sometimes mass conversions occu
[786] called "revivals," during which people shout, chant, speak in tongues, and sometimes collapse.

794 Although strict observance of religious practices
829 must be maintained by the converted while they are on th island, it is possible for them to relax this observance when they visit mainland cities. The converted see noth wrong with attending plays or movies in Glasgow, as long as no one observes them. A non-believer once commented wrly, "They believe in the 11th commandment: thou shall not be seen." Women who have spent many years in domest service on the mainland, where they generally live very different sorts of lives from those of island people, of return to the island to retire. They then take up the
• [292] color of their surroundings. The long black dress then becomes the appropriate garb for them on Sundays. As on person observed, "Women deposit their curam in the Left Luggage Department at Stornoway, and pick it up fifty ye later."

779 The beliefs of the Free Church include explanations for all events. "Everything of importance that happened in history is recorded in the Bible." Predestination li behind all unexpected events; a sense of fatalism dulls

Racially, a broadhead

Hundreds
103 of place names are known to the villagers
which are not marked on any map. These place names
[193] constitute part of the oral tradition of a population
which has lived in a confined geographical area for
generations.

632 In most of Lewis, village and township coincide.
621 The village of Shawbost is composed of two townships,
● 311 South Shawbost in which the crofts splay outward like
423 a fan from roads which curve over an uneven landscape,
[363] and North Shawbost which is composed of linear streets
(see Map C), to which the crofts are perpendicular.
Each township has its own common grazing land, and its
own grazing committee. All of South Shawbost and part
of North Shawbost belong to one private estate (which
includes other townships to the southwest), and most
of North Shawbost belongs to an estate which extends to
Barvas. Beyond the fact that non-crofters in South
Shawbost have found it easier to acquire crofting status,
little difference between the two townships appears to
be due to their belonging to different estates. As
[427] elsewhere in crofting regions, the landlords of the
[529] two estates are concerned mainly with the sporting
potential of their land.

632 The two townships are themselves divided into named
neighborhoods (cf. Vallee 1955 for a discussion of
"natural neighborhoods" in crofting areas).

311 There are 144 crofts in the village (nine of
241 which, in South Shawbost, were added after the turn of
[175] the century by non-crofters encamped on common grazing
[427] land who applied to the landlord for crofter status).
Thirty-four (almost a quarter) of these crofts are
vacant; that is, the holders of the crofts live else-
[527] where. One of the vacant crofts is used by its absentee
[493] tenant for holidays, and one sports a trailer (called
[485] a "caravan" in Britain) which may be rented to tourists
during the summer. The rest are cultivated or used for
[428] grazing by crofters or non-crofters in the village who
[427] by inheritance or by formal or informal subletting have
gained use of the land.

241 A little over half of the crofts are worked as
individual units; 44% of the crofts are worked as
combined units of two and three. Twenty-four men have
the use of two crofts each, and five men the use of three
crofts each.

16 A feature of crofting townships usually emphasized
is their disproportionately large number of aged people
and small number of young people, who tend to migrate
to the cities. An age-sex "population pyramid" of the
Highlands is not a pyramid but a top-heavy hourglass
(see Table I).1 Most persons of child-bearing age have
migrated from the area and the number of children is
1. [See p.vii--Analyst]

And so, after every good wish for days, years and life, the Invocation closes: "Peter has come and Paul" . . . the Disciples and the Archangels. . . . Jesus the mild and the Spirit of guidance have come,

> And the King of kings has come on the helm,
> To bestow on thee their affection and their love,
> *A bhaireadh duit-se graidh us ruin.*

The ideal of choice maidenliness which this Invocation portrays, culminates in the thought of the loveliness that was Christ. It rises, too, to stirring virility: "the island at sea, the fortress on land", or "the step of the steed on the plain". Yet when all is said, it is a womanly image which prevails: after the fortress comes the well in the desert, and after the charger's step, the gracious calm of a floating swan. It is all the more significant that the Invocation was addressed both 'to boys and girls' in one isle, and 'to youths and maidens' in another. Not simply was boyhood taught to honour girlhood: ideal womanhood was invoked to raise manhood itself to fullness.

Upon marriage, the husband replaced the maiden's snood or *stiom* that bound her uncovered hair by the wifely kerchief, *am breid*. Folded diagonally, its three-cornered shape came to symbolise the Trinity, in benediction on the bride's head.[1] A poem to a bride, "now beginning her dual course", commences, "A thousand hails to thee

likeness. The short second stanza given stands out alone: the poem, having attained its climax by a rhythm sustaining the upward, sonorous movement, is hushed by its few simple words. In *From the Hebrides*, Mrs. Kennedy-Fraser rearranged one or two of these lovely stanzas, as one of her 'lyrics with refrain'. *Cf.* A. Geddes, *The Songs of Craig and Ben*, vol. ii, 1955.

[1] The kertch is spoken of in many songs, in which a lover hopes to place it on his young love's head, or a husband praises its whiteness as worn by his wife. When first I knew the Lews, the kertch was still commonly worn under the more recent Lowland mutch, and either framed a young face, or an old one, charmingly. The two have not quite vanished, though memories of what the kertch once symbolised are hard to find.

THE OTHER ISLANDS

even to the extent that the St Kildans used their observations of the flights of birds both as compass and as omen for good or evil. Martin speaks of the islands with amusement and admiration. He indicates that the community was backward in some ways: they were illiterate, and wondered naïvely at the newcomers and their manners. 'The inhabitants of St Kilda are much happier than the generality of mankind, as being the almost only people in the world who feel the sweetness of true liberty.'

In May 1877, when the local tourist trade had hardly started, HMS *Flirt* sailed from Greenock with food to relieve hardship among the St Kildans, and an officer of the Highland & Island Agricultural Society on board reported that 'Tobacco was what they invariably asked for'. The ordinary diet of the island consisted of, for breakfast, porridge and milk; for dinner, potatoes and the flesh of fulmar, or mutton and, occasionally, fish; for supper, porridge when meal was plentiful. Seabirds' eggs, from March onwards, also formed a staple food. Tea was taken once or twice a week and the islanders were reported to be 'rather fond of it'. There were eighteen inhabited houses, sixteen of which had zinc roofs, two being thatched huts. The sixteen new cottages had been erected about 1863, 'and are certainly much superior to the inhabitations of the same class of tenants anywhere in the Western Isles'. All were well furnished, peat was used for fuel and there were two watches and one clock on the island. There were some seventy-five islanders; most of the men were old, and only two of them were unmarried, with twelve spinsters still to choose from. All read the Gaelic Bible. The men were mostly tailors, shoemakers and weavers; every house had a loom. They made all their own clothing, the men also making the women's dresses, and a good deal of blanketing and tweed cloth was made and sold. Nearly every house had a spinning wheel and a large pot in which the yarn was dyed. The women were expert knitters. Each croft and house was rented at £2 annually, sheep being charged for at the rate of 9d per head; these charges were usually paid in kind.

Feathers of the sea fowl formed the principal export of the island. The factor paid 6s per stone of 24 lb for black feathers; and 5s per stone for grey. For these he received, in Edinburgh or

781 794 [302] meetings. If a woman converts when she is off the island, as occasionally happens during the first year or so at university or other school, the tell-tale sign is that she begins to let her hair grow, and wears it tied back in a bun.

The word curam means "conversion," but is also used in ordinary conversation to mean being careful, such as keeping one's clothes tidy. It also means to be circumspect. In a religious context, it means to be careful of one's behavior, as this behavior reflects on the state of one's soul. When a person "has the curam," he has demonstrated that he is "in a state of conviction," that he has undergone conversion. People say, "A change has come into my life." The "change" includes the cessation of drinking and going to dances and concerts. Woman stop smoking. "After you are converted, you don't watch TV on Sunday. You should do everything for Sunday on Saturday, like shine your shoes for church or cook the Sunday dinner."

781 794 795

781 273 A dramatic change in behavior is often found among men who have had a history of hard drinking. One man went into the bothan, raised a glass to his lips, but never drank. "He put it down and walked out. They put the glass of whiskey aside, expecting him to return. He was a hard-working man, one of the hardest workers in the village, but everything went to booze in the bothan. He slept in

175 632 241 In any case, the "town" or township was not the effective work unit, but rather was the larger neighborhood in which several joint farms existed. [233] The tenants of several joint farms grazed their stock on the surrounding moorland (i.e., on common grazing land).

D. From Run-rig to Crofting

175 233 241 311 Run-rig was an agricultural system suited to a pastoral people, who required the use of open, common pasture for grazing their livestock; the arable land was limited, and of varying quality (according to Day (1918: 12), 54% of the land in crofting counties was mountain and heath used for grazing, and only 5% was [423] arable land). Residents worked several strips of different quality, and the strips (in drained beds of earth a few feet wide and many feet long called lazy-beds or fiannagan) were usually re-allocated every few [625] years. A "constable" acting for the landlord ensured that proper husbandry was maintained.

175 241 178 427 The joint farm, and the stratification of tenants and subtenants within the farm, disappeared as "progressive" landlords began, in the second half of the 18th century, to substitute compact holdings for the "mingle-mangle of dispersed strips (Gray 1952: 46)" 000 which characterized run-rig. Hamlets or clachans

178 and work in British cities or abroad, sending money
[464] home to sustain their aged parents who by law cannot
[457] be removed from the croft.

E. Changing Land Use

311 Darling (1955) described the previous Highland way
175 of life as a well-adapted, ecologically balanced system
182 in which proper use of land was attempted by limiting the number of livestock, preserving a proper ratio between cattle and sheep, and regulating the flow of stock on the land throughout the year. Dikes (fences of turf or stone) and drains were communally repaired
178 and cleaned. Although continuity with the previous way
311 of life is evident today, the overall picture is one of
[182] partial use, and misuse, of natural resources. Various
[654] advisors from government organizations and colleges have been brought in to encourage effective husbandry and land use.

1. Specialization and Individuation: The change from an ecologically adapted, internally regulated community in which land was used intensively for subsi

178 purposes, to a community which, as an agricultural
311 entity, requires transfusions from the larger society, is accompanied by patterns of specialization and individuation. The following table (Table III)[1] of agricultural statistics for the parish of Barvas demonstrates the change, over the past 100 years, from intensive subsistence agriculture to specialized production. From a broad-based subsistence use of the croft (as revealed by the number of acres cultivated for barley, potatoes and oats; and by the number of cattle, especially milk cows), there emerges a tendency
[23] toward specialized production. The number of sheep,
[236] which require less attention than cattle, has increased
[241] since the late 1920's when the weaving of Harris Tweed
[246] commenced in earnest; and around this time there also occurs a differentiation in cultivation, between the production of barley and potatoes (used largely for human consumption) and the production of oats (used largely for
[231] feeding livestock). After 1931 agricultural returns began to distinguish between beef and dairy cattle. During the past ten years the number of beef cattle in the parish of Barvas has increased.

241 An important factor which crofters on Lewis now
654 take into account when making decisions about their

175
166 In the last half of the 19th century, many famil
were "cleared" from the district of Uig and resettled
173 Shawbost. According to a local version of village
625 history, the Constable evicted persons from North
166 Shawbost and resettled them in New Shawbost. "The
people from Uig were fishermen, so they needed to be
the sea. They wouldn't take a croft in New Shawbost
all." According to another version, the crofts once
extended all the way across from Carnan to the loch;
when the Uig people came, the crofts were chopped in
half, and the street called Baile Stigh was created.

175 Whatever effect the Constables had on land use a
625 animal husbandry, they are now referred to as "tyrant
who went mad or committed suicide after the Crofters
of 1886.

175 Cattle and horses were tethered or herded within
311 easy walking distance from the township; sheep could
233 be left on the moor without much surveillance. At a
much earlier time another dike existed out beyond the
[178] township dike. The dikes were used according to prin
[221] found in grazing schemes today: the sheep were kept
out on the moor, beyond the second dike, until midsum
when they were moved in closer to the village. At th
point they were still out of the arable land of the

/facing p. iii/

township, but on land which had been rested and which thus provided better grazing. During the winter the sheep were allowed past the township dike, to graze along with the other livestock on the stubble of corn and barley, and mineral-rich seaweed by the shore.

After World War II, the individual crofts began to be fenced, and the township dike was no longer repaired. The fact that sheep were still grazed communally on the moor meant that everyone had to go out together on a particular day rather than individually, but fencing of individual land facilitated variability in land use. Less use was made of crofts for raising crops, and they could be used for grazing sheep all year round.

b. Reseeding schemes and apportionments:

Another illustration of the individuation of land use is provided by comparing the number of apportionments granted by the Crofters Commission for Lewis in the last 10 years with the number of township reseeding schemes carried out during the same time (see Table IV).[1] A crofter may apply to the Commission for an area of land (apportionment) to be sliced out of the township's common grazing land and given to him for his own use; theoretically, his share in the township's common grazing land is reduced if his application is granted.

[See p.x--Analyst]

178 land is reduced if his application is granted. Also,
311 a group of men in a township may apply to the Crofters
232 Commission for permission to fence off a portion of
233 the common grazing land and improve it as grazing for their mutual use. Grants are available for both schemes. The township reseeding schemes, adopted widely after their introduction, have been superseded by the number of individual apportionments.

The first township reseeding schemes in Lewis were tried as an experiment in Ness, Harris, Barvas
[654] and Bragar. "The Department of Agriculture fellow watched us every step because it was an experiment. Oh, there were times we cursed him and wanted him away." In Shawbost, a few interested crofters went around the village to see if others were interested. "We got a bad name for it; no one could see anything to it. But those people got the benefit of it." According to one man, initial reluctance to participate in the schemes was overcome when the agricultural advisor pointed out that if they overstated their costs, they would not have to pay much money themselves.

Between 1959 and 1962, seven township reseeding schemes were developed in North and New Shawbost, and four in South Shawbost. They were intended to give

241 the edge over non-crofters. "Squatters can do what
178 they like, cut peats, put sheep and cattle on the common
423 grazing, but this is a privilege, not a right."
829

The clerk of a grazings committee says, "When it comes to an argument between a crofter and a squatter, the crofter always wins. A squatter has rights only with the grazing committee's permission. If one crofter disagrees, the squatter is out."

241 A squatter muses bitterly, "I wanted crofting status
423 because I wanted to get a Department of Agriculture
578 grant to build a house. I work on the peat road; I go to all the fanks. But at a township meeting, they didn't want me to get crofting status. They were afraid I would start grabbing peat banks or apportionments in the common grazing or something. There's your brotherly love for you."

311 4. Subsidies: In the section entitled "Changing
654 Land Use" I suggested that the availability of subsidies has encouraged a more specialized investment in agricultural activites.

654 The villagers are keenly aware of outside institutions
829 which give money. They speak to each other about forms
241 which they receive from the Department of Agriculture and the Crofters Commission, in much the same way as they are curious about the number of tweeds which another

105 The
241 fact that crofting townships are located on marginal
654 land is one reason that the larger society is not motivated
• [311] to exploit the land. The Crofters Holding Act of 1886
[671] and subsequent legislation ensured protection of and incentives for continued maintenance of crofting and the crofting township.

Protective government legislation, grants and loans for housing, subsidies for rearing livestock, relatively low taxes, and the economic protection provided by a socialistic government in times of crisis have helped to maintain a core of crofting families for many generations.

105 The predominance of older persons in the township is
152 striking, but many of the younger people who have left
632 the island to work on the mainland return frequently,
166 contribute part of their salary to the remaining family
434 members, and plan eventually to marry and settle down in
584 the village or to retire there. Long-term residence of
[621] kin-linked families in a small area has in itself contributed to the boundedness of the township network.

105 The policy of the government, through developmental
241 agencies such as the Highlands and Islands Development
654 Board, has been to support economic strategies that
632 complement rather than interfere with the functioning of the crofting township with its small holdings and communal
ooo practices. The Harris Tweed industry is lauded as an

Appendix C

Balance Sheet of a Croft

*159 "The Muillear" has one croft and a two-acre buaile.
241 In 1970 he planted one-eighth of an acre with three bags
244 of potatoes, two of which he bought for L14/16, and
433 harvested 22 hundredweights. This was sufficient for
[435] his family's needs and provided some feed for his livestock for all but two months of the year. A small plot is planted with cabbages, for domestic consumption.

• [311] Seven-eighths of an acre is planted with oats; one-
[246] and-a-half acres with grass and hay; and two acres
[233] are used for rough grazing.

*159 The Muillear is interested in new ideas and techniques.
232 He goes to meetings and discussion groups sponsored by the
233 North of Scotland College of Agriculture, and has bought prize rams from the mainland to improve his flock. He tries to raise a few sheep using techniques of good husbandry rather than a large flock which would be given less effective care. He is teased by other crofters for "overfeeding," and for keeping his sheep on the croft and the township reseeding rather than out on the moor. "His sheep get homesick when they get out of sight of the croft." He wins the prizes at the Carloway Cattle Show each year, in a

ISLAND REGIMENTS

For a number of years it had been the practice for a considerable proportion of the older schoolboys during their attendance at the Secondary School to put in their training with the local body of Territorials—the Ross Mountain Battery. At the School Prizegiving of 1914, these boys attended in their uniform to be ready to go off the same evening by steamer en route for the annual training camp. Before the School re-opened, the Territorial Force was mobilised, and for some of these lads there intervened four long years of toil, of fighting, and of sickness overseas, before they ever saw their homes again. 175* 702 704

Later (1938), the unit became the 203rd (Ross) Battery of the 51st (West Highland) Anti-tank Regiment. It was whilst fighting as an anti-tank battery that, with other units of the 51st Division, the men were taken prisoner at St Valery in 1940. Today, after more changes, the battery is the oldest in 540 LAA Regt RA, TA (the Lovat Scouts). In 1960 the Ross Battery received the Freedom of the Burgh of Stornoway in recognition of a century of voluntary service to the community and the nation.

LAND USE AND CROFTING

The history of land use and the crofting system in the Highlands and Islands (see Chapter 5) is full of difficulties. In the older days of the clan system, before the rot set in, though the clan members belonged to the chief, they also belonged to the land and the land to them. In such a climate, the agricultural system, for it was such then, was in a reasonably healthy state; the land was worked to the full. Good land was available for the support of the clan, and as often as not in good years there was ample produce, crops, and livestock, to send south to well-paying markets. That fertile lands abounded is indicated by the reports of visitors in various centuries. But times changed. The increase in population after the breakdown of the clan system by statutory legislation, and the policy of population placement carried out with a rigorous enthusiasm, planted seeds of discontent—in particular a hunger for land. The land was in any case becoming ever more inadequate to support those already on it. 241 614 82 311 • 175* (443) [161] (656)

The story of the agrarian troubles in the Highlands area is well

documented; and Harris and Lewis played out their part in the agitation for more land. Briefly, when the clan system was broken down, the clansman found himself freed of the obligation of service to the chief. The chief, on his side, found himself thrown to the economic dogs. Payments in kind were no currency; a house in London or in Edinburgh had to be paid for in cash, and a London hairdresser would hardly accept half a dozen eggs for his services. The effect of the Heritable Jurisdictions Act was like a butcher's chopper. With a stroke a social organisation was given notice to change overnight, with no period of transition allowed. The chiefs looked to the land for their money. In the old system, their prosperity had been largely measured in fighting men. Now the pressures of economics demanded increased rents from those who were being called tenants. Increased rents can, however, be paid only when the land's productivity rises. The agricultural changes percolating through the Lowlands of Scotland had not even begun to penetrate to the Highlands area. Many tenants found that, unable to pay the increased rent demands, they were ejected from the lands which, incidentally, they had held by traditional understanding—written deeds were rare. Emigration started, and the vacant lands went to sheep-farmers, well able to pay good money for the grazings.

Some chiefs did give their tenants time to change to new methods of land use, and were careful not to make a breach between agriculture and grazing. Their tenants in turn improved the land, changing in particular from the old run-rig system, whereby a man working a piece of ground one year had the same piece the following year only if the dice were thrown his way. But the class of farmers' tenants called crofters (who had no security of tenure) or cottars (a squatter type with no legal recognition) found themselves on the verge of starvation. The few acres of ground they had, or to which they had been removed, were quite unsuitable for intensive cultivation to produce even the basic necessities of life.

The picture of land use was that of a great black pot boiling furiously with a brew of which the final taste was quite uncertain. When the boiling was controlled, the land began to be parcelled out, a share to each family. This led to a rigid, almost monolithic,

[TEXT CONTINUED ON PAGE 55]

agrarian order. Crofting townships were created which contained holdings of a uniform size, often fit to provide only a bare subsistence living. This is still so today. There were and are no means of achieving ambition through some kind of agricultural promotion, no ladder to climb to prove one's ability to win the land over to one's side to increase its yield. And as each family increased, the progeny demanded land. The family acres were divided, subdivided and fragmented to a vicious mathematical system: more people, less land.

In the nineteenth century, many estates were sold. The newcomers, with no kinship ties with the small tenantry, saw that the only way to make their estates economic was to establish large farms, which meant the eviction, by force if necessary, of the small tenants. This is what happened. For those who did not emigrate, it was a life of huddling around a weak fire, whose flame itself could hardly stand, and thinking of the prospect of starvation and the 'old days'. Thoughts nourished on these old days became the root of action; and a fierce agitation for land reform started. The Minutes of Evidence of the Napier Commission (1882-4), of the Deer Forest Commission (1894-6) and the several official reports on the conditions of the crofters and cottars, give ample evidence of bitterness and despair as the result of poverty and lack of opportunity. About 1870, unrest in the congested areas of crofting townships became a political issue. The flames of ideals were burning high and bright. Ideals were transformed into action: take the land!

By 1880, the ripples from the stone flung into the agrarian pond were reaching the general public. Sides were taken: one stood either on the economic touchline, or on that dangerous thin red line of sentiment based on high feelings and a deep sense of wrongs being perpetrated on fellow humans. The landowners naturally insisted on the right to move into an era of land use in which management was not hampered by affairs of sentiment or philanthropy. Governed by the cold principles of business, they hardened themselves in the face of their attackers. And though they pointed to arrears in rent, and their inability to improve their land agriculturally while they had tenants not of their own choosing, they faced mounting antagonism.

5 AGRICULTURE AND FISHING

THE economic possibilities of the peat blanket of the island, particularly in Lewis, have attracted the attention of many would-be exploiters. Sir James Matheson's advisers formed the idea that the Lewis hags could be turned to a good profit, and Sir James's series of peat reclamation and improvement programmes are still echoed today. He first cast his eye to the west, north of Achmore, a township set up more than a century ago on deep peat. The peat reclaimer he employed was none other than Alexander Smith, one of the best-known 'speculative' agriculturalists in Scotland at the time. Smith had already transformed the Carse of Gowrie from bog to a fertile tract of land; could he not do the same in Lewis? The site chosen was seven miles from Stornoway and the little hamlet established there was called Little Deanston, in recognition of Deanston, Perthshire, to which Smith belonged. The soil consisted of bog-moss, varying in depth from 3 to 8 ft. Sixty acres were wedge-drained and laid out in fields of ten acres enclosed with ditches and turf fences. Ploughing and trenching began and fertilizing agents were applied, including clay marl, shell sand, guano and dissolved bones. Two of the fields were put through a course of arable cultivation, the others being laid down in grass. After the fields had been worked for a few years it was found that the driest ground gave the best results. In time the land was handed over to some crofters from nearby Lochganvich, but in 1850 it was abandoned because of the difficulty in getting seaweed for manuring; and besides it was not possible to keep the land in good heart and to do fishing as well. The tract of land concerned today still shows a better quality of pasture than the adjacent natural moorland.

Smith gave his impressions voice in 1844, just after his first visit to Lewis, to the august members of the Glasgow Philosophical Society. The cultivation of the soil was as primitive as the

islanders' manufacture of cloth. The inhabitants were at least a century behind the times, though they were, he found, in no way deficient by nature. They were social in their own style, and they had very good heads, 'that is, for people not accustomed to habits of thought'. So far as agriculture was concerned, nothing in the way of draining the land had ever been accomplished; nor had any effort been made to penetrate the hard sub-soil. He held that the great scarcity of timber had been a serious handicap when it came to agricultural implements—to their renewal, repair or possible improvement. Under direction, however, he was convinced that improvements in land use would result in considerable benefits to the island. He added that he hoped the period of this improvement would not be far off and that visitors would find 'a green, pastoral land instead of a dreary waste'.

Yet not until 1928 was peat reclamation and development again brought out for an airing. This time, the benefactor was the late Mr T. B. MacAulay, a Montreal magnate, a son of Lewis connections. He gave £10,000 to establish an experimental farm in Lewis, and a site on Arnish moor, not far from Stornoway, was chosen. It was typical of most of Lewis: black, water-holding peat, which when squeezed, instead of allowing water to escape from it like a sponge, oozes itself through the fingers. The aims of the farm were to provide additional arable land on which to grow winter fodder, and to improve, at as low a cost as possible, the grazing on the moorland. Fifty acres were certainly converted from moorland to arable, and this formed a basis for an experimental extension to another 100 acres. By 1936 the farm had a sales income from produce of about £1,400. The stock in that year included 40 head of thriving cattle, including 15 dairy cows, 20 poultry, 140 blackfaced sheep, and some fattening pigs. The sheep were a late addition, made with the dual aim of pasturing on moorland too deep and soft for cattle in wet weather, and of improving the sheep strain of the island.

By 1938, it had been shown that some lasting improvement on moorland of reasonably favourable slope could be effected at a materials cost of about £3 per acre, and without heavy labour costs. Thus, the common grazings held by the crofting townships could be improved, if a co-operative effort were organized. So

far as the reclamation of arable land from moorland was concerned, however, requiring as it did under-draining and cultivation, the labour costs were heavy, approaching the £20 per acre mark including the liming and fertilizing.

Though the farm was used for dairying with some reasonable results, the moorland acres put into good heart at Arnish were left to deteriorate. The run-down of the experiment followed the depression of 1933. Funds dried up, and in 1939 the farm was let to a tenant. But the lesson obtained from the MacAulay farm was a good one. By simply dressing with shell sand, of which large quantities are available on the shore-lands, applying some form of phosphate and seeding with cheap clover or ryegrass—involving no cultivation—large areas of moorland can be persuaded to do a good job. The work at present being undertaken by crofters to improve moorland grazing is worth mention. Areas of land have been given a surface application of approved compound fertilizers, phosphates, lime or shell sand, and selected grass-seed mixtures. The results are literally a sight for sore eyes, and bring Alexander Smith's 'green, pastoral land' close to realisation. Although individual crofters have taken advantage of the help given to regenerate rough grazings, the most spectacular results have been seen on the township common grazings; most of these have been fenced off and improved. Today, something like 14,000 acres of lush green pastures are steadily spreading over deep peat where formerly grew only sedges and brown heather.

To end this aspect of land use in Lewis on a historical note, the story of re-seeding had its beginnings during the time of the Napoleonic Wars. A minister who had some land at Barvas, on the west coast of the island, decided to attempt the reclamation of useless heather-bound and bracken-choked land. He sanded the area with shell sand, seeded it with a good strain of grass and used sheep to tamp in the seed. One can imagine what Lewis would be like today if the Barvas minister's work had been followed up by Alexander Smith and those who set up the farm at Arnish.

for mutton and for wool, the right type for translation into Harris Tweed; the predominant breed is the blackface, whose fleece is hard, wiry and long-lasting. The demand for raw wool has also encouraged larger flocks among crofters in such places as Barra, where virtually no weaving is done in the immediate locality. In general there has been since 1911 a 40 per cent increase in the livestock carried on the island's crofts, about twice as big a rise as found anywhere in the seven crofting counties of Scotland.

In an attempt to reduce Lewis's milk imports, in 1962 three crofters at Garrabost on the Eye Peninsula combined to set up a small dairy farm using the lands of their three crofts. A new dairy byre and dairy premises were built and equipped with the necessary electrical equipment. Grants were given by the Department of Agriculture & Fisheries for Scotland, the Crofters Commission, and the Highland Fund Limited. The first year of operation was closely supervised by the Lands staff of the Department at Stornoway and guidance given as necessary. The milk is retailed in Stornoway and district and amounts to about 5 per cent of Lewis's daily consumption. This little scheme has shown that the island could with some organised effort become independent of milk imports, which have been estimated at upwards of £100,000 worth per annum. Over £70,000 per annum is also spent on imported butter and cheese.

In 1947 the number of crofts in Harris and Lewis was 4,020. In 1971 the figure was 4,146 (3,592 being in Lewis), representing a slight increase in a quarter of a decade. Thus, crofting as a land use activity in the island provides a fairly stable element in the economy, although it is subsidised by the crofters' participation in the fishing and tweed industries. A crofter, it should be mentioned, is often a tenant of more than one croft, working them together as a unit. These units vary in size, the greatest bulk of them (about 60 per cent) having up to 5 acres of arable land. About 2 per cent contain over 30 acres of arable land. In recent years there have been proposals for the better use of the reclaimed moorland, particularly for cattle-raising, which would offer the crofter an increased cash yield from his interests. The annual reports of the Crofters Commission indicate, indeed, that the trend to the small croft obtained from the fragmentation

of larger and more economic working units of over 30 acres of arable land is also apparent in the southern Hebrides, the west mainland of Ross & Cromarty, Argyll (mainland and islands) and Caithness.

The acreage of common grazings held per holding varies from under 50 to some 200. The crofts, as already mentioned, are in townships, of which the island has 168, half being fenced and half consisting of individually fenced crofts. During the winter most of the crofts are laid open for winter grazing by sheep of general ownership. Manure resources are mainly dung, seaweed, shell sand and of course artificials where necessary.

A new aspect of crofting in Lewis is its extension into forestry. A recent survey by the Forestry Commission indicated that under 400 acres of the land not being used for crofting were suitable for afforestation, and that these acres were made up from twenty-three different plots. At Garynahine Estate can be seen the beginnings of a real afforestation unit of some 500 acres, a scheme of the utmost significance for the economic future of Lewis and for the relationship between crofter and landlord. Too often in the past this relationship has been biting, hard and inflexible; in particular the crofter was understandably unwilling to release good land for planting trees. But the crofters of Callernish agreed that the right of usage of 285 acres of the common grazings belonging to their township should revert to the landlord, this land being thrown in with 220 acres of the Garynahine Estate. Labour comes from the affected township and others in the area.

FISHING

Early beginnings

It is the humble herring that has contributed so much to the island's economy and its history. At a very early date in history, the Hebridean fishings were worked by Frenchmen and Spaniards who must have found them rich enough to repay the long journey and weeks away from home in the cold Minch waters. It was not, however, until the end of the sixteenth century that the wealth of the Minch was really discovered, this time by the fishermen on the mainland of Scotland who copied the tricks of their trade

HARRIS'S OFFSHORE ISLANDS

Scarp

Until 1972 Scarp was the most westerly inhabited island in Scotland, separated from the Harris mainland by a strait which is about half a mile across at its narrowest, coursed by strong tidal currents. The island is about three miles in diameter, rugged, especially in the north and west, with cliffs on all sides; the maximum altitude is nearly 1,000 ft. On the east side lies a tiny marginal belt of good land, machar and soil; on this green shelf, about one-third of a mile long, were all the crofts of the Scarp settlement. Many stand deserted, and abandoned lazy-beds in sites beyond the present settlement indicate a denser population at one time. The island's population-carrying capacity was severely limited by the minute amount of land available for tillage: of a total of about seven square miles only half a square mile can be used. Climatic conditions and soil type also restrict the range and quality of crops grown.

Scarp was originally settled about 1810 and was occupied by eight farming families who were reasonably comfortable. Not only did they have the island to themselves, but they had access to good pasturage on the Harris mainland opposite. About 1823 thirteen small townships between the head of Loch Resort, Harris, and Bunabhainneader were cleared, some of the displaced families coming to Scarp. Some emigration back to Harris took place in the 1840s, but when about 1868 the proprietor divided Scarp into sixteen crofts instead of the previous eight holdings, these were further divided by the people themselves, trying to accommodate their families and friends from elsewhere. In 1861 the population was 151; the peak was reached in 1881 with 213 persons. In 1951 it was 74. Communication with the Harris mainland is by boat, plying between two stone-built jetties.

The local economy was essentially a subsistence one, with self-sufficiency in such products as potatoes, turnips, cabbages, oats, milk and fish. After a break of some years lobster-fishing has recently been reinstated as an occupation. Oil lamps are the only lighting, though a few houses have piped water. The small shop

178
311
232
233

extra grazing for cattle, but by that time the cattle were already on the wane.

"The original idea was to provide an early bite for the cattle, because everyone had cattle then. Otherwise they would need to buy more baled hay to see them through the winter."

"Almost everyone in New Shawbost had a share in the 1959 schemes, about 26 altogether. Then it was mostly cattle. We took turns bringing them in at night, and I remember taking 33 home, with some left behind for the night. The cattle were grazed over the summer, and the [221] lambs were put on from August 10 to October 10. Many dropped out after the first four or five years, when they stopped keeping so many cattle. When the number dropped to 13 or 14, they started using the schemes for mixed grazing, and then some took up their shares again. When we only had the cattle and lambs, we didn't need a souming; but when the mixed grazing started, we had to keep down the number of sheep. Last year we had difficulty with disease."

A forty-acre scheme in North Shawbost started with about eighteen crofters and non-crofters participating; there were 37 cattle altogether. Now only four have cattle; the rest have sheep. The sheep-keepers say,

178 "The cattle give too much trouble." A smaller scheme
311 is grazed only by sheep. On the schemes where mixed
232 grazing is practiced, a number of conflicts arise between
233 those who have only sheep, and those who have cattle as
[578] well. To accommodate different demands, one township scheme was divided with a fence; cattle were put in for a month in one part, and then shifted to the second part. The sheep were then brought into the first half. All stock had to be removed from the scheme a month before the lambs were weaned, so that all worm eggs and other harmful elements in the dung of animals previously present would have time to die. What was once used for a single purpose by everyone now has to be divided.

"I paid one pound a head to put cattle on the
[435] reseeding," says a man named Iain. "Now I have to move
[578] them off already. Those sheep people want it for themselves. I won't use it if they're going to be like that. Next year I'll have the use of two crofts and my apportionment. And now that I have my own tractor I
[409] can put a load of sand at the bottom of the croft to
[242] make the grazing better."

According to another person, who also keeps cattle
311 on the reseeding, "Some people want to move their live-
233 stock on and off the schemes when it suits them, like Iain,
232
829

311 who wanted to keep his bullock on the reseeding for
233 another week because he wasn't ready to sell it; but
232 he should have known the rules. Some people want to
829 keep both cattle and sheep on at the same time, although the agricultural advisor says cattle should go on first, because sheep go for shorter grass. Other people want to put on twice as many sheep as those who have both cattle and sheep. When they stop keeping cattle, they think they're not getting a proper share of the reseedings.

"The Crofters Commission wanted communal township schemes. But people have different demands. It's better to go for an apportionment. You can do what you want with your own land."

178 The number of township members participating in
311 the communal schemes is diminishing to the point where
232 it is less expensive, and much less subject to conflict
423 arising over differences in stock-keeping, to invest in
476 individual holdings of land rather than try to sustain communal practices.

Shawbost

592 unmarried sibling. Eleven households consist only of siblings who have never married, men and women who in 1971 were 45 years old or older. Two widows live with [589] their unmarried siblings. Sixteen widows or widowers live alone, and sixteen unmarried persons live alone.

241 592 423 671 888 The large number of households occupied by single, elderly people reflects the use of the croft as a place of residence rather than as an agricultural unit, a view of the croft that was given legal expression in 1968 by the Miscellaneous Provisions Act. Before 1968, [428] the croft went automatically to the eldest son if a crofter died intestate. Since 1968, the rights of different claimants must be considered and tenancy by a new person must be confirmed. District and county councillors argued for this change, saying that a widow was often left on the croft and her security endangered because the eldest son was usually far away from the island, in Canada or some other country. In other words, rather than an agricultural unit which should naturally be taken over and worked by the male head of the household, the croft is seen as a place of residence for the infirm and for the aged, and especially for the aged female.

657 185 423 888 The Crofters Commission has suggested that elderly people be allowed to rent small plots of land on which

657 185 423 888 311 their houses are located, and that most of the land be freed for use by more active crofters, but the ideology associated with possession of the croft makes such a plan extremely difficult to implement. "The croft is your base, the only thing you have. You don't want it taken away, even if someone else is using it already anyway. Our county councillor suggested amalgamating the unused crofts at a recent meeting. No one said anything, but no one wants it."

592 241 311 Of the five households that have the use of three crofts each, one consists of a bachelor who uses the crofts for grazing a large number of sheep. A second household is composed of two brothers who had stayed at home to take care of their aged parents. One of these brothers recently married, after the last parent died. These men keep cattle and sheep, and both weave.

592 241 311 288 A third household is headed by a married man who has recently sold most of his livestock in order to "concentrate on the weaving." His father, who used to haul peat with a horse and cart in exchange for the use of grazing land so that his family never had to go to the sheilings, died a few years ago. "My father was a crofter only. The weaving didn't start until the 30's. He was wounded in the war. He got a pensio and sold a cow or a few sheep each year. But I didn't

592 24 31 288

like to leave the loom for the time it took to look after the sheep."

592 23 24 [233] [246] [288] [463]

A fourth household consists of three unmarried siblings in their 40's and 50's who recently sold their cattle and now keep only sheep for their own consumption. They cultivate a small amount of oats and hay to feed the sheep during the winter. The brother who was largely responsible for taking care of the livestock is now "concentrating on the loom," and his brother works in the mill. Their sister, who used to work in hotels on the mainland, now keeps house for them. Described as a "self-contained family," they have a tractor and a deep-freeze and take care of their peat and the harvesting of crops by themselves. One of their crofts has become too waterlogged even for grazing and was sold recently to the son of a local crofter, not for agriculture but as a prerequisite for applying to the Department of Agriculture for a housing grant. Only tenants of crofts can apply for such grants. As this particular croft is too wet to be cultivated or used as a house site, the only motive which the new tenant has to become a crofter is to gain access to governmental subsidy.

[407] [404]

654 423

592 233 31

The fifth household is composed of a retired couple and their son and his wife and family. They have no cattle, and use the crofts for grazing sheep.

184 share their characteristics. So to gain a sense of pro-
105 portion from the start, we must map the location of Scots
[128] countrymen, their numerical importance, and their types
102 of grouping. Let us begin with the first of these three
13 aspects, their regional location (Fig. 2).
• 311 The base map on which the data are plotted shows the
[102] boundaries dividing the hill masses of the Highlands and
102 Southern Uplands from true 'lowland'. This hill country
13 is mostly covered by rough pasture (left blank on the map)
• 311 within which lie strips of 'Isolated Arable' with other
184 improved land in the valleys and along the outlying coast-
226 lands (shown in black). This hill country includes the
241 Scottish Isles, with the exception of Orkney, which falls
361 rather into the category of 'lowland'. It is largely devoted
[241] to sheep farming and crofting, or left to grouse and deer.
[427] The lowland area from the Orkneys to the Tweed and Sol-
way is devoted to mixed and dairy farming with lowland
types of small-holding, except, of course, for 'Industrial
Regions', which include most of the urban area of Scotland.
[226] Within the 'three-mile' territorial limit from the coast
lie the inshore waters, in which local fishing was once
important, and might again become so; these are left
white on the map (Fig. 2). By contrast to their narrow
extent on the East Coast, their width is notable in the
Northern Isles and on the West Coast.
102 The problem set in making this map is to show two
13 different worlds, as it were: the Highland and the Lowland.
184 The two are rarely envisaged together, and much confusion
128 of thought and policy results. To master the map, the
182 reader may scrutinise first one part, the Highlands (cover-
ing the other with one hand), then the other part, the
Lowlands (in the same way): thus each will appear clearly
in turn. Both can then be envisaged together.

FIG. 2.—Map to show (i) the use of land and sea in and around Scotland, with special reference to the Crofting Townships Zone of the NW. Highlands and Isles, and (ii) the average size in each county of labour-teams of farms and small-holdings in the Lowlands

182 Let us begin with the economic and the social signi-
184 ficance of the Highlands and Isles with which we are
concerned. Economically the crofters' 'living space' is
• 311 the narrow interrupted belt of improved land (shown black)
[241] which is generally fronted by the sea and its inshore waters,
[427] and is backed by the Crofters' Grazings (enclosed by line
[361] C on the map). Some 700 crofting townships or com-
munities are found in Zetland, the North-west mainland
and the Western Isles, each with its Common Grazing;
the line C also encloses a small area devoted to other
grazings. Deer forests predominate on the eastern, main-
land, side of the line. On the remainder of the hill country
are to be found the hill-sheep farms, with other small farms
and small-holdings.
174 In the past the fishing crew at sea and the joint labour-
62 team on land formed the communal units contained within

Key to use of Land and Sea
(Highland, Island and Urban Areas)

1. The dotted line C . . . . . C encloses the Crofters' Grazings, mainly 'Commons'.
2. Black area: strips of 'Isolated Arable' within the rough pastures of the Highlands and Southern Uplands (left blank).
3. Horizontal ruling: open sea, outside the 'three-mile' belt of 'inshore fishing' (left blank).
4. Vertical ruling: urban and industrial regions.

Key to Size of Labour-Teams of Farms and Small-Holdings
(in the Lowlands)

The symbols show the average number of employees per team in each county.

(1 symbol = 100 teams)

(a) Per Mixed and Dairy Farm
- 2·2 to 3·8 (3·1)
- 4·1 to 5·6 (4·9)
- 6·4 to 8·2 (7·1)

(b) Per Full-time Small Holding
- 0·7 to 1·0 (0·85)

(The numbers in brackets are the averages for Scotland.)

174 the township; and to each were allotted the rights of the
226 common grazing and the fishing grounds. For more than
241 a century the croft has been held individually, though in
473 the townships the common grazing is still held in common.
621 Beyond these 'homely' limits lie wider horizons, in the
632 past those of seafaring and of droving or the chase, and
[198] today of fishing and gillieing at home, or of ocean journeys,
urban occupations or colonisation.
182 In the Lowland regions each symbol represents 100
184 holdings. For (A), 'mixed and dairy farming', the par-
241 ticular type of symbol shows the average number of workers
employed on a farm-holding in each county. On each
farm the employed workers form what may be called the
'Labour-Team'. A team may be 'small', 'medium' or
'large'. The Scottish averages of these three types (indi-
cated in the inset key to the map) are roughly three, five
and seven workers per team. Four 'casual' workers are
counted as equivalent to one 'permanent' worker, but
farmers' wives are excluded. Under (B), for the same
Lowland counties and areas, full-time small-holdings are
[593] shown separately. The Scottish average of less than one
full-time worker employed, most often a son or daughter
of the small-holder, is typical of all the counties.
241 As to the relative importance of the different classes of
[162] farms and small-holdings in Scotland, true agricultural
land-holders number 68,000, of which fully one-third hold
part-time holdings (like the Island crofters), one-third
'full-time farms', and rather fewer (one-fifth) hold 'full-
time small-holdings'. The remainder accounts for other
types of less importance. The farms predominate in terms
of improved land, full-time employment, and of course of
• [311] production. As to area, farms cover 80 per cent of agri-
[464] cultural land. The farmers employ nearly 90,000 workers,
[162] [refer to map p. 16 ·· analyst]

241 Scotland had begun to lag since her pioneering effort from
134 1750 to 1880.
198 Fortunately, Scotland is now recognising that in peat
[654] reclamation, on the one hand, and the improvement of
rough grazing, or at least its maintenance, on the other,
[185] there lies a problem of national importance. More than
half the land surface of the country consists of mountain
• 311 and heath land used for grazing, not including 'deer
forests' from which sheep had been altogether excluded.
The arable land of Scotland is less than one-sixth of the
whole, with about one-twelfth in addition under permanent
grass. Moreover, since most of the enclosed land is distant
from the area of rough grazing, the latter is partly wasted.
The difficulties of soil and sea and of the whole economic
situation are great, and must be understood.

(a) THE ISLAND LANDSCAPE, LAND-FORMS AND GEOLOGY

1. Aspects of the Isle

131 Lewis-and-Harris, the most northerly isle of the
Outer Hebrides, and the largest, is roughly lozenge-shaped.
Although only thirty miles in width, it is over sixty miles
in length. Attached to Harris parish is the little isle of
[103] Berneray, half a dozen miles farther south. It puzzles
the stranger that, while the archipelago of the Outer
[873] Hebrides is best known to the inhabitants as "The Long
Island", Lewis (or the Lews) and Harris, which actually
form one island, are spoken of as separate islands.[1] Yet
nothing could be more natural. Before the making of

[113] [1] "The Long Island", Gaelic *An Eilean Fada*, as a name for the Outer Hebrides has the sanction of traditional usage, as Alexander Carmichael noted in his Introduction to *Carmina Gadelica* (vol. i, 1900; and 1928).

PLATE II. AIR VIEW OVER STORNOWAY BAY, LOOKING NORTH

The Point, with the Inner harbour behind, is the nucleus of the burgh; nineteenth-century extension filled up the ground inland. Lews Castle is on the left

/facing p. 27/

(Fig. 6). The anemograph at the Butt of Lewis records one of the highest of British averages for gales and frequent breeze: for 1930–35 the mean frequency of gales (winds over 38 miles per hour) was 62. The mean speed for December and January is 25 m.p.h., which can best be realised by imagining winter travel in an open car with no wind-screen. This mean maximum is a reminder of the difficulty of tree-growth, as gales loosen or quite uproot the trees. It also helps to explain the proverb: "A long sleep in a big wind" (*cadal fada ri gaoith mhoir*). This is as true for the byre as the bed-closet, for what could cattle-beast or man be doing out of doors in a winter gale? Although the mean speed drops from 18 m.p.h. in April to 13 or 14 m.p.h. in July and August, it rises in September to 18 m.p.h., with ill effects on the harvesting of late crops. Winter winds blow in full force from the end of September to mid-February at an average of 22 m.p.h. or more. The gales make winter fishing dangerous, and their force smashes breakwaters on the west coast.

Yet winds at the exposed cliff-height of the Butt are only slightly greater than those of similarly placed spots on the mainland coast, or islets like the Bell Rock (Firth of Tay), and the east of the Island is comparatively sheltered. For example, the mean annual speed of wind at the Butt was 19·2 m.p.h., and for the same period at the Bell Rock it was 18·2, at Aberdeen 9, and at Kew 7·6. When the anemograph at the Butt was moved even to a 'well-exposed' spot near Stornoway, the average number of gales for 1937–40 dropped to two-thirds of the preceding triennium. With shelter, the difference from the Butt and the approach to normal conditions on the mainland would become greater still. The planting of shelter-belts would foster crops, comfort and activity on the Island.

(B) VEGETATION

1. *The Vegetation-types and Pastures of the Highlands and Isles*

In order to see the Island problem in true proportion, the types of vegetation and rough pasture in the Highlands and Isles should be outlined. Dr. Hardy's reconnaissance botanical survey of the Highlands, with its coloured map, has been utilised in the compilation of *A Reconnaissance Map of Vegetation of Scotland*.[1] The latter has been boldly simplified in Fig. 7.

The Highland pastures are of two main regional types, eastern and western, with the addition of a few great stretches of peat moor. East of a line from Stirling to Inverness, heather is dominant, as it is on the heights around the Dornoch Firth, from north of the Cromarty Firth and Ben Wyvis to the border of Caithness. To the west of this, heather, though still found, is mixed with grass and sedges. The grazings of the North-west Coast have been the adopted home of Cheviot sheep for over a century, for Cheviots are grass-feeders which cannot thrive on heather-tips. True, acid 'Dry Grass Moors' lie inland from the Beauly Firth and Dingwall. On the rest of the West Coast from Gairloch and Loch Torridon south to Kintyre, 'Marshy Grass Moors' with but little pure heather clothe the lower slopes. These give way on higher slopes to 'Mountain Pastures', reaching up to about 2500

[1] M. E. Hardy, *Esquisse de la végétation des Highlands d'Écosse*, Paris, 1905; also *Scot. Geog. Mag.*, 1906, June number with map, and May number with text. A. Geddes and L. D. Stamp, *A Reconnaissance Map of the Vegetation of Scotland* (Ordnance Survey, 1/625,000: 10 miles to inch), 1953; explanatory pamphlet in the press. A résumé by L. D. Stamp has appeared in his *Land of Britain: Its Use and Misuse*, 1948, based on Tansley, *The Vegetation of the British Isles*, 1946.

feet. These marshy grass moors, with their mountain pastures above, are the adopted home of the hardy Black-

FIG. 7.—Map of vegetation-types and pastures of the Highlands and Hebrides

face sheep. Wherever in the west the slopes drop fairly steeply, good pasture grass with some heather may grow, or rather did grow until bracken overwhelmed them.

Inset into the Highlands are three desolate tracts of boggy 'Peat Moor', in Sutherland, Rannoch Moor far to the south, and on the plateaus of Lorne and Mid-Argyll; while marginal to the Highlands are (1) the drier and more dissected plateau peat moors between Lochnagar and Stonehaven, and (2) the intermittent stretches of Lowland peat moss.

Finally, intermixed with these are strips of surviving or planted woodland. Below the heather moors of the western Highlands stretch the great pine woods of Atholl, Deeside, and Speyside and the Moray Firth. As the heather thins out, towards the West Coast, pine gives place to oak. Near both are found the graceful silver stems of the birch, with its small resistant leaves. These woodlands invite the modern forester, who brings in pine, larch and firs in the east and, in the west, notably the Sitka spruce, brought here from the rainy western highlands of British Columbia.

The uses to which the pastures are or have long been put, are three: as crofters' grazings—mostly 'commons' (and so indicated on the map), as sheep farms, or as deer forests. (1) On the 'commons' there is close grazing for both cattle and sheep by crofters near the townships or the holdings, and much peat-cutting. (2) On the hill sheep farms there is more or less regulated burning and some hill draining but almost no cattle pasturing; and as a result of both facts, bracken has invaded the grassier moors. (3) On the deer forests almost no care is given and the heather, scrub and bracken are coarse and strong. An indication of the margin of the commons, according to whether it 'marches' with farms or with deer forests (given in Fig. 2 by line C), is also shown in Fig. 7 because of its marked effect on vegetation.

2. *Plant Life in Lewis-and-Harris*

Lewis has been dismissed by many as a floating peat bog, and its name has even been derived from *leodus*, a bog! For good or ill, peat influences the Island, its history, the distribution of its people and the economic and social features of their life. In Lewis, peat once covered everything except the narrow fringes of sandy machar, the surface of the inland waters, jutting rocks and steeper hills where drainage is rapid. Man's encroachment on that carpet has so far been mere nibbling. Except for the machar lands, every acre of ground occupied or cultivated by man has been reclaimed from peat.

The Map of Vegetation and its Key portray the distribution of the main plant communities (Fig. 8).[1] All plants are of low habit with small leaves, well protected from excessive transpiration. They are mostly perennials or biennials; annuals are comparatively few. There is no burst of flowering save where the heather blooms on better-drained slopes, or where shell sand has blown, enabling clovers, vetches and meadow-sweet to give colour and scent. Moss, sedge and dwarfed heather prevail widely in tussocks.

Constant cropping by sheep and cattle, and also deer, tends to keep vegetation low, but on the wide, boggy moors this is a minor factor. Nor is there much systematic heather-burning. Even upon the islets of inland lochs, untouched by grazing animals, and in spite of better drainage due to the undercutting of the waves, growth is not really luxuriant. Bracken, however, is found on the islets, and a little on some former sheep farms, but not on the heavily grazed common pastures, for cattle keep down bracken.

[1] [see p. 50 -- analyst]

3. *Plant Communities of the Island: Hill Moor, Peat Moss and Machar*

The types of pasture in the Island should be compared with those elsewhere. The peat moors of Lewis resemble those of northern Sutherland. The machar lands of the Uists, and of Tiree and smaller isles, surpass those of Lewis, while on the mainland and Inner Isles raised beaches provide workable, well drained soils. The 'rocky hill pastures' of our Island correspond to the rockier 'mountain pastures' and 'plateau summits' of the Highlands, and the 'fair' and 'hill pastures' of Lewis rather to their widespread 'wetter moors'. Grazing conditions are of course, similar in crofting areas alone. The edging of heather above the sea-cliffs of the Island and on the western mainland forms a picturesque element of the landscape, seen from a passing vessel, but only a narrow strip of the pastures. The plant communities shown on the Map of Vegetation (Fig. 8) must now be outlined.[1]

(1) On the *Rocky Pastures* the scattered patches of soil are covered by a low and close sward, almost exclusively of perennials and grasses, such as bent (*agrostis*), common and brown, sheep's-fescue grass and wavy-hair grass (*festuca* and *Aira*); small sedges and mosses, with club moss and lichens towards the summits; heather, and fine-leaved bell-heather (*Erica cinerea*); and flowering plants like thyme, bird's-foot trefoil, tormentil and smooth heath bedstraw (*Galium*). Those rocky pastures prevail in the Forest of Harris (Plate XI).

(2) *Fair and Hill Pastures.*—Below the bare rock domes

[1] An authoritative flora of the Island is in preparation by Miss M. S. Campbell, F.L.S., British Museum (Natural History). Her "Flora of Uig" (Lewis) has appeared (Arbroath, 1945). For Dr. Hardy's tentative list of plant names see A. Geddes, *Scot. Geog. Mag.*, vol. 52, 4, 1936.

Chart of Positions of End Map
[Facing End Map]

C

F

361 The chief advantage of moving uphill to the road has been
178 ease of communication and access to grocers' vans and mill-
311 spinners' lorries; but the disadvantage proves to be the
491 laying on of running water. A much-needed scheme for
water supply is now being applied by the Department of
[654] Health for Scotland. Scrutiny of a 'quarter-inch' map will indicate the chief facts and tendencies and the conditions they involve.

4. *Distribution of Population*

162 The distribution of rural population can be closely
311 estimated by inspection of a 'quarter-inch' map, where both the area of cultivation and the house dots are noted. Comparison with parish populations shows that on an average one dot represents seven or eight houses or families and thirty to thirty-five persons. Since there are now no large farms, cultivation indicates crofting, and, therefore, a typical density of one person to a little over half an acre, or 1000–1200 per square mile. Rural numbers over the whole Island show a density of about twenty-five persons per square mile. If the fishing grounds, with a sail here and there on the wide sea, were added, the density would be lower still! A single dot found with cultivation indicates crofts, which are hardly ever found singly. Where no cultivation is shown around a single dot, this generally indicates an isolated stalker's house, a shooting lodge by a road, or a shieling (*àirigh*) out on the moor.

(B) STORNOWAY

1. *Site, Plan and Development*

361 The plan of Stornoway and its harbour shows three stages in the growth of the town, the first two picked out

[TEXT CONTINUED ON PAGE 89]

175 natural zone, could not be extended. In any case, the re-
433 clamation of clay land tended to slacken as efforts turned
434 to fishing and kelp-making. The introduction or increased growing of potatoes added to the human, but hardly to the
[182] animal, food supply. Finally, while the beginnings of
311 medical knowledge and vaccination had aided the growth of population after 1750, veterinary science had made no
[232] progress, nor did it advance in the Island for many years to come. We may conclude that an average stock per Island
[422] family about 1720 was rather more than that of 1790, and the acreage relatively larger, while both were greater than the average of today, particularly in the Lews.

175 What, then, could a family have to eat, from such crops
262 and stock? While in winter even now there is almost no
244 milk to be had on a croft, and there would be little then, there was salt meat, dried or salted cod (or herring) and fish oil; oat and barley meal and some rye meal; cabbages; and, increasingly in the eighteenth century, potatoes. Martin included potatoes among the crops grown even on far St. Kilda in 1697. A century later it was written that the people of Uig, for instance, had, though 'unwilling', been induced to grow and eat them 'forty years before'; and the years tend to be under-estimated where changes are slow and memories long! But it was written of Harris that by June the meal and potatoes had mostly been consumed, "and such as cannot afford to purchase imported meal subsist chiefly on the milk of their cows and sheep, with what fish they may chance to catch, till their wants are relieved by the first fruits of their potato crops early in Harvest".

175 We conclude that with even less money but a little
511 more grain the population in the Island had fluctuated
162 about a mean for some centuries before, as it had in so
171

593 On the mainland, both Lowland and Highland, an
outlying reclaimable patch of arable, lying near distant, little-
423 used pasture, frequently gave a single family the chance
[241] of a living. Such a site meant solitary toil for the man and his family; but there might be advantages such as
311 an occasional deer from the forest, or a post as hunting
[184] 'forester' such as was held by many a Gaelic hunter-bard. In the Eastern Highlands such a high-lying croft was
[224] known as *Ruigh* (anglicised to Ry-). Traditions of poverty
[823] with individuality in isolation were handed down, for example, from one of my forebears who held such a *ruigh*,
175 Rycorrach, one of several strung out along the 1250-feet
361 contour in a small, high valley off Strath Spey; the last
[511] of them was abandoned only recently. Such a *ruigh* may have originally been a summer shieling, only occupied when shortage of corn-land below, coupled with new possibilities of a little profit from sheep-shearing, led to settlement there.

178 At the fringe of the Island's deer 'forests' of North
361 Harris and Park, stalkers are still found in lonely lodges
224 and dwellings, individuals often of character and worth, as they need to be; and a few isolated shepherds, such as
233 one finds on mainland sheep farms, dwell on small islets.

But in the Isles, isolated, high-lying spots for single crofts
361 are rare. And the clearest distinction must be drawn
621 between the true solitude of a single, isolated cottage or croft and the sociability of a group of four or five, or even
184 two or three, crofts, such as those of lobster fishers; for even a few families form the germ of a community, in work and in leisure.

175 The potentialities of co-operative practice were over-
178 looked by agricultural reformers, excusably enough. For when new methods were required, run-rig kept back the
654 pace to that of the slowest, virtually arresting reform. Soon
476
241
423

134 that no initial reclamation had been needed on the scatt.
241 In each year of cultivation, it is true, manures of a sort, principally seaweed and sooty sods from the roof, are applied; but they form a temporary improvement only for the crop to be taken, and do not constitute reclamation. After manuring, the grasses and clovers are simply turned over and the land, 'rested' and manured by cattle, straightway gives its best crop.

175 It is otherwise with what is won from the moorland.
311 As Dean Monro wrote of the reclaiming Lewisman in 1549: "In this country all is peat moss-land at the sea coast" (the long machars of the west of Uist give place to rocky coasts round much of Lewis), "and the place where he wins his peats this year, there he sows his corn the next year; after that he guids it weill with sea-ware". Even where the slopes are fairly smooth, the peat land has not the uniformity of the machar and the continuity of its arable strips. In addition to sea-ware, sand may be brought by creel or by pony pannier to reclaim peat, forming a heavy burden. Moreover, the first crop is always a poor one, and may be almost lost. Although in his brief notes Monro used the singular 'he', we know that the peat was usually cut co-operatively by teams. Hence most of the hard labour of reclamation may, indeed must, have been done co-operatively too, but by small teams, not by the members of a whole township together.

233 The sharing of common pastures is the last, but im-
423 portant, feature of land holding in common. The two kinds of pasture required were, firstly, those close at hand, animals being tethered or herded in the crop-growing season, and secondly, the more distant summer pastures.
[632] The people of certain townships, which were without a large outrun close at hand, had to go some distance to

175 which heartened them for resistance in common against
829 landlord and State, both in the agitation for reform of the Land Laws during the next ten years and in their demands for 'the return' of sheep farms to crofting, which continued until all these were divided soon after 1919 and the ex-Servicemen's return.

175 Expenditure of capital in Lewis during more than a
423 generation, from the purchase of the estate in 1844 down to the death of Sir James in 1878, helped to maintain the
646 people and provide relief in bad seasons. It left Lewis greatly improved in roads and paths, in sea communica-
175 tions and in buildings of various sorts. Two real efforts had been made to utilise Lewis peat, industrially for paraffin
646 oil, and agriculturally by reclamation. Given the resources
•311 and knowledge of a century ago, these attempts did their
[161] initiator credit. Yet failure left the Islanders to continue crofting without either an additional occupation or the extension of croft land, even at the high population density (per acre of arable) which Matheson had found on his purchase in 1844.

175 Subdivision of crofts was the first result. A father
423 would simply divide his croft between himself and a son, who might not even be entered on the rent-roll of the estate, and the two would inevitably need more stock than before upon the common. The second result was simply 'squatting': the building of a house, perhaps with a tiny kailyard, on a piece of the 'skinned' land. As building went on overcrowding old sites, filth accumulated and springs were contaminated, crofting was hindered and cows became fewer per family, in spite of overstocking. By 1886 about two-thirds the number of the cottars and squatters found in 1914 were already in occupation. In 1914 there were over 3000 statutory crofts in Lewis, their

121 1794, for instance, their crews not only fishing but also
175 buying from local fishers. Islanders occasionally earned
228 a pittance as pilots, for until the charting of these rocky coasts navigation was most dangerous.

175 The herring industry was in the hands of 'adventurers'
228 (who 'ventured' their capital), and the Islanders benefited little. The British export was aided by a bounty which
[472] helped to capture the Continental market; but, as Adam
[439] Smith pointed out, no bounty was given to the small, open boats suitable for the north-west lochs. Thus the operation
175 of the Salt Duty after 1707 and of the bounty system from
228 before 1745 until 1786, illustrates two of the recurrent
656 blights upon "Public Administration" in the Isles. As Day wrote, their interests have had to suffer "either deliberately, for the benefit of other parts, or other classes in the kingdom, or inadvertently from ignorance".[1] Although the bounty system was widened to include small boats after 1786, the Salt Tax remained until 1817.

To overcome difficulties, the British Fisheries Society was founded with Government support in 1786. Although Stornoway then seemed too far afield, the Society's concentration upon larger settlements foreshadowed Lever-
• [311] hulme's principles after 1918. At Ullapool, Tobermory and Lochbay (Skye), and at Wick, quays and stores were constructed and dwelling-houses built, with croft land and grass for a cow, to be reclaimed. Although concentration at Wick led to the sale of the three western properties about 1842, the Society had done some good work in the West. The chief difficulty of the West Coast north of the Clyde area and south of Stornoway District remained: the lack of a well-marked seasonal migration of herring.

[1] J. P. Day, *Public Administration in the Highlands and Islands of Scotland*, 1918.

175 for a firmer hold upon the land and for a return to aban-
178 doned sites. The communal possession of joint farms, held
433 directly or under tacksmen, gave place to individual possession of crofts. Yet the legal recognition of perpetual
(731) tenure in 1886 gave not only the crofter's home but the
[166] crofting neighbourhood a security unequalled in Britain.
[167] The use of moor and machar in common was retained; but its control for improvement or reclamation by the
175 estate or the township was weakened, rather than strength-
178 ened, by the Crofters' Acts. Confusion grew—both upon the arable land, subdivided, unenlarged and unimproved,
423 and also upon the common grazing, sorely overstocked in
427 spite of ever diminishing 'soumings' (or family shares) of cattle. Rating difficulties and anomalies appeared. Communal discipline, maintained at sea by fishing, was weakened on land after the abolition of the joint farm-group, and almost nullified in the townships by subdivision and squatting.

175 A year before the potato famine of 1845, a new landlord
178 had brought good-will, capital and pioneering effort to
433 Lewis. These had been directed to experiments in the reclamation and the industrial utilisation of deep peat.
[427] Helped by employment on these and other works, the
• [311] population of Lewis continued to increase, when increase in Harris was arrested for a generation. Yet while neither
[161] experiment with peat met with success, little aid had been given to develop fisheries. In both parts of the Island a growing population was supported from the 'seventies onwards by help of earnings derived from the seasonal herring fishing on the East Coast and from inshore line fishing at home. Women added to the Island income by seasonal 'gutting' and, in Harris, by their spinning and
[167] weaving. Money was earned by work on the mainland,

114 reports of early speeches by Leverhulme, Professor Patrick
185 Geddes had quickly come to feel that his old acquaintance,
473 Leverhulme the industrialist, might have overlooked such
433 agricultural potentialities as existed, and that he had quite overlooked the social significance of land. Hence, in May or June 1919, Geddes proposed that a survey be made by one who knew the Highlands botanically, who was experienced in agriculture, and who had some knowledge of Highlanders at home and of sociological factors. Geddes
[123] suggested Dr. M. E. Hardy for the task. Leverhulme forthwith accepted the suggestion and commissioned Hardy, whom the present writer assisted on the Island.

• 311 Examination of the farms, so hotly debated, showed that they possessed little or no initial superiority over neighbouring crofting settlements. That the farms were placed in the best coastal tracts for agriculture is true, but their shores are at the same time the poorest in harbours and fishing facilities. As a result, the crofters dwelling near the farms along parts of the same machars and smooth slopes were 'crofters' who sometimes fished, rather than fishermen with a house-site and a potato patch. As Hardy wrote (in his MS. Report): "The chief superiority of the farms resulted from levelling, drainage and enclosure" by landlord and farmer, sixty or seventy years before. The improved land both of farms and adjacent crofts was reclaimed from peat and machar, or from an admixture of both. "How then", asked Hardy, "did so much value
[423] come to be attached to the farms? The traditional grievance (of eviction) led neighbouring crofters to turn their eyes towards the green patches of the abandoned villages and endowed the old land with special virtues. After the Crofters' agitation of the 'eighties, successive Boards came with their eyes already focused on the farms, by the

3: Geddes K-4, 3 (1919-1952) 1955 ES10 Highland Scots
Lewis and Harris

137 there is frequently found the most thriving of the vege-
311] tation types of Lewis and the best grazing ground. It
233] includes grasses such as those already named, together with purple *Molinea*, meadow soft grass (*Holcus*), and mat grass (*Nardus*); sedges (*Scirpus* and *Carex* spp.); with the field wood rush (*Luzula*) and a fair number of flowering plants. Heather is common in this and the following community (3).

With true 'hill' pastures, found especially to the east of the Forest of Harris and between Loch Seaforth and Loch Shell, are included fair pastures with good grasses on the rocky hillocks near the villages around Loch Roag and also on the low, steep hills northward to Shawbost.
34] The 'skinned land' lies in strips too narrow to be shown on the map, but may form a ring of desolation round the village. The hard moor-pan resists natural seeding of plants unless broken by the pick, but broadcasting of a cheap seed-mixture with a little fertiliser can work marked improvement.

(3) *Marshy Grass Moors.*—Where the slopes are gentle, and the acid humus has accumulated to form peat, is found coarse, tussocky, damp pasture, of sedges and grasses, grading from the 'fair' and 'hill pastures' to the beginnings of hummocky peat hags and smooth sedge moss. It covers the slopes of hills such as Ben Barvas and Muirnag and the hillocks that emerge from the great central trough of brown peat moor. It also characterises the low but broken areas in southern Lewis. This type forms a belt below the 'hill' and 'rocky' pastures of Harris. At its best its prevailing hue is olive-green turning to a silvery shade and then to russet later on. Annuals are few and the grasses are coarse.

33] (4) *Peat Moors, Mosses and Peat Hags.*—The most

137 widespread plant community in Lewis is undoubtedly the
[133] *sedge and cotton grass moors* (or ' mosses ' as they would be called in the Lowlands), which overlie deep peat generally at low levels, on flat or slightly rolling grounds. The peaty floor is waterlogged and boggy, and the carpet rises into tufts, dense cushions or mops, out of which bristle innumerable stalks, thread-shaped, sheathed, fibrous and elastic. There are few flowers apart from the bog asphodel, while heather does not thrive but is stunted. On the slopes, sedges (*Scirpus* and *Carex* spp.) and cotton grass (*Eriophorum angustifolium*) dominate, and in the hollows, sphagnum moss. Owing to slope and consequent erosion, the surface may break into hags (or ' bruachs '), separated by deep and more or less broad channels of bare peat with puddles.

[311] For reclamation by tractor and peat plough, smoothness is essential, combined with some slope for drainage. From observation of the fragments of poor pasture topping the hags in channelled eroded peat, it can be noted that drainage alone is not enough to create good pasture, though it
[241] is the first step. In order to complement the work of drainage, fertilisers must be applied to encourage plants which absorb water in quantity and transpire it freely in the course of rapid growth. For it may be said that plants like heather—adapted to withstand drought, physical or ' physiological '—do not transpire water in any great quantity. Thus they fail to ' drain the ground from above ', as juicier grasses or fodder plants do by the vigorous ascent, transpiration and renewed absorption of water.

[134] (5) *Heather Moor.*—The common heather (*Calluna*) dominates on many steep slopes and rocky bluffs, sometimes on acid humus, or again on decomposed rock and screes, generally at low levels. Among the chief plants

by reclamation, notably at the Macaulay Demonstration Farm on the 'peat moss' of Arnish Moor (south of Stornoway), then too small to be shown, and in South-west Harris where new crofts were laid out in the thirties.

The six main types of vegetation in the Island may be grouped as three. First are the Hill Pastures and Moors: (1) 'Rocky' among the bare hill-tops of Harris and Uig, and (2) 'Fair' on favourable slopes, which merge into (3) 'Marshy Grass Moors' of coarse grass and sedges, heath and rushes. Secondly come (4) the vast brown 'Peat Mosses and Moors', either smooth and wet, with sedge and cotton grass, or channelled and cut up into hags; near the broken edges of the island cliffs this expanse is often fringed by (5) the 'Heather Moor'. Thirdly, by the sandy bays, are (6) the 'Machar lands', *i.e.* the 'Sandy Pastures', rich with clover; though narrow, this coastal plain is all important to stock-rearing and potato-growing, and so to settlement. In traditional terms, these three groups form hill moor, peat moss and sandy shores: *monadh*, *mòine* and *machair*.

(c) CROFTING AND THE CROFTERS' YEAR

1. *Place of Settlement and Choice of Work—Past and Present*

Lewis and 'Harrey', as they were called four centuries ago, were well described by Dean Monro,[1] and his description is fundamental to the present scene. "Harrey is very fertile and fruitful for corne, store and fishing, twice mair of delving is in or of teilling", which appears to mean

[1] Dean Monro, *The Western Islands of Scotland . . . in 1549*, reprinted by A. Mackay, Stirling, 1934.

that the spade and foot-plough (*cas chrom*) were used for double the area ploughed. From Monro and from the precise Statistical Accounts of the eighteenth century, it is clear that pony-drawn ploughs were usual in the smoother parts of Lewis. In North Harris are 'abundance of Deir'. We must not forget here that 'faire' and fertile are comparative terms for the West. "Lewis is faire and weill inhabit at the coste, ane fertile and fruitful countrey, for the maist part beire [barley], with 4 Paroche Kirkes." There is "ane castell callit Stornoway . . . with 3 salt loches, very fine for take of herrings . . . [and] infinite fresh water loches. In the Lewis there are 8 waters with take of salmont. . . ." There were also "Whales . . ." In "a cove 2 fadoms deep at the ebb sea, uses Whytuns (whitings) to be slain with huiks", there were "very many haddocks and Men with their wandes sitting [as today] upon the Craiges of that cove, and Lades [boys] and Women also. . . . In this Ile there are many Sheip for it is very guid for the same. For they lay furth ever one mures and glens and never enters in a house and their wool is bot anes in the zeire pluckit off them in some fauldes." In Zetland wool is still plucked, not sheared.

The description of reclamation is specially worthy of note: "In this countrey all is peit mossland at the Sea cost, and the plaice where he wins his peitts this zeire [year] . . . there he sawes his corne the nixt zeire, after that he guidds it weill with Sea ware" [*i.e.*, improves or manures it with seaweed]. On "Ellan Colm Cill [an islet apparently on the east coast south of Stornoway at the mouth of Loch Erisort] Macloyd of the Lewis has ane faire Orchard, and he that is Gardener has that Ile [rent] free. . . ."

Around the coast of Lewis no absolute limit is set to

ich Dean Monro has described as he saw it. economic return must be balanced against nature. Although natural conditions are nay not form a complete explanation of the of reclamation in the nineteenth century; tion from the agricultural advances of the arriers of mountain and sea caused the re- rogressive methods until the wave of agri- vement had spent itself by the middle of To this cause must be added other influences ose leading to peasant advance in the rest of pe: the political history of the Gaeldom revolution in land tenure and in the social per classes, the commercial, industrial and opment of Great Britain. All these factors the contrast offered to the Lews by western western Norway, lands in which the soil re comparable to those of the Island. Yet proceeding, as on skinned land at Ness, f ground have been steadily broken in by ade or plough.

and agricultural land are placed around h their fishing grounds. In spite of what —that the Lewisman is and has always been isherman—fishing alone is not enough to is distribution, for the agricultural conditions are also best along the coasts, or were so for As Stevens remarked, the light sandy ds are there, and the fringe of partially im- lose by; drainage is, on the whole, better, nd and sea-ware are to be had for manure. also serves still as fodder, while one or two etimes cooked for human food; carragheen

241 thirds of an area nominally under crops actually grows them. It need hardly be said that such crofts do not support a family.

The means of cultivation have been either pony-drawn ploughs in the smoother north, or else the foot-plough [407] (*cas chrom*), and the straight spade in the hilly south. I saw the almost obsolete foot-plough used on hilly ground near Rodel, Harris, in 1919. In the smoother lands from Stornoway and Barvas northward, however, the crofts then were already laid out in parallel strips, no more than twelve to fifteen feet wide, divided by open drains. Open drains have increasingly been converted into underground drains over which pony and plough can pass. The cattle feed on the rough pasture or on the grass about the crofts, supplemented by hay cut with a sickle from the grassy edges of the 'lazy-beds'. Quite recently, rotation grass has been [178] sown on the arable strips, and mown for hay by the scythe. [407] Tractors were introduced in war-time, in 1942.

In many of the villages, cattle are still taken to the 233 summer pastures out on the moors some miles from the 221 crofts. Those who herd the cattle live in huts or shiel- • 311 ings, annually re-roofed. In the congested 'Point district' (the Eye Peninsula), the cattle must go to the moor on the main island or be taken on to their owners' crofts from late May or early June to about the 10th of August, in order to clear the common grazing and allow the grass to recover. This migration takes place, of course, because 233 of the restricted area of common pasture. On the other 311 hand, pasture is plentiful in the parish of Lochs, lying all round some of the villages, and here the use of the shieling has been practically abandoned. In almost all villages, with the exception of those of the Eye Peninsula, there is less summer pasturing than formerly; fewer cattle are sent

233 away, and for a shorter period. The sheep wander over • 311 the moors all the year round, though they hang about the crofts when the winter is severe.

221 A comparison with mountainous Norway or the Alps 132 and their high summer pastures suggests itself; but in 171 Lewis altitude is almost negligible, and the shielings may lie only two to five hundred feet above that of the crofts [133] beside the shore. The difference between winter and [311] summer is in any case less, snow being rare and the conditions being such that even in summer the shieling pasture remains poor. Hence it is that while modern Norse and Alpine economy still maintain the summer pasture, the shielings have died out in the Highlands and are slowly decaying in Lewis. Seasonally, stock are transported over longer distances, from Highland to Lowland pastures.

181 Reasons for the continuance of these and other crofting [178] ways, or for their abandonment, are not of an economic [461] order alone: not only the remuneration received for labour, but the feeling for the work counts enormously. Visiting a couple of distant shielings in the summer of 1919, I found that two lads newly home from the Navy had come up from their village 'for a holiday', bringing rods for trout-fishing and high spirits for play. By day they fished or flirted. By night they slept in one of the two shielings, while the two laughing lasses they had come to visit shared the none too wide couch of the other shieling with the two older women there. One of these was a matron with a motherly twinkle in her eye, the other was a spinster in whose eyes there shone a memorably vivid light; she was the sister (as I found later) of a noted minister on the mainland. The bare simplicity of shieling life is traditionally softened by fellowship and a gaiety that is not beyond [538] control. A Lowland poet once coined a famous phrase,

137
134

blows away, no doubt because the humus rots and quite fails to bind the sand. These two types together form the true machar.

(*c*) From the machar rise the slopes of drift-covered rock which bear a top dressing of blown shell fragments, more or less mixed with the soil by treading and cultivation, and imperceptibly giving place to the undiluted 'black soils' of moor and croft with their corresponding vegetation or crops. The shell-sand is often blown onto the rough pastures high above a bay.

Where a portion of the true machar has been cultivated it is allowed to seed itself. A sprinkling of weeds is followed by the re-establishment of a mixed flora. In both the sand and the consolidated sand-covered drift grow wild white clover and vetches; and among the grasses are rye grass (*Lolium*), Yorkshire fog (*Holcus*), cat's-tail (*Phleum*) and meadow grass (*Poa*). Other plants include familiar weeds and wild-flowers like yarrow, cow-parsnip, golden rod (*Solidago*), silverweed, wild carrot, thyme, plantain, sorrel, yellow rattle, harebell, eyebright, pansy and many more. Arrival from the bare brown moorland to the sand-blown slopes or dells is made a pleasure by stream-side flowers like meadow-sweet.

137
311

Woods and Cultivation.—In addition to the woods indicated on the map, in Stornoway Castle policies, shelter-belts or plantations occur at certain lodges. Cultivation, as will be explained in the section on crofting, is rarely continuous; and the map shows areas as cultivated which are far from being either continuous crop land or
[185] even permanent grass of the first quality. Yet since this map was drawn the improved area has been extended somewhat

i [see map on p.50--analyst]

"the lone shieling of the misty island". Traditional Gaelic songs tell rather of shielings grouped within hail, with their sweethearting and good cheer!

3. *Crops and Stock*, circa *1938*

As the thirties mark a transition between early conditions prevailing until 1919 and those of 1947–53 (Appendix I), the present tense is used.

Of the Island's 528,000 acres, including deer forests on the Harris border partly grazed, there are 24,000 acres of arable and grass land. Barvas parish leads with 6500 acres, then come Stornoway, Uig and Lochs, Harris being last with 3300 acres. Roughly one-third of the Island's arable and grass land, or 32 per cent, is permanent grass, chiefly machar, with a maximum of 39 per cent in Uig, but a minimum of 9 per cent in rocky Lochs, most of this on one small farm. About 10 per cent of the arable and grass land area is given to hay production; of this, rather less than one-third is rotation hay grown on the plough rigs or parks, and rather more than two-thirds is hay from permanent grass. Lochs, lacking machar, has 20 per cent hay, while Barvas, better off for machar, has only 4 per cent. Even this proportion of rotation hay shows an increase on the crofts since 1919. Stornoway parish, it will be noted, occupies an intermediate place, but if the facts for Point (Eye) district were contrasted with those for the villages along the machar, the differences between them would emerge clearly. As it is, they can be guessed from the vegetation map showing the machar. Oats is the chief crop, and occupies 33 per cent or just one-third of the arable and grass of the Island; excluding the permanent grass, it constitutes half the crop.

In Lochs it occupies only one-quarter of arable and grass. Barley, mostly four-row, or bere, is less important as a food today than formerly, and now occupies only 6 per cent, and, though it reaches 13 per cent in Barvas, with its machar, hardly any is grown in Lochs. Rye (*seagal*), still found in the machars of the Uists, is little grown in the Lews. Potatoes grow well everywhere, occupying about 15 per cent of the area, though townships with plentiful machar land grow most. Turnips are being gradually introduced, and though their liability to disease has somewhat discouraged the crofters, the proportion is now about 2·3 per cent. Cabbages occupy a small area (1 per cent), latterly along with lettuces, carrots and the like.

Rotation hay and turnips being almost unused up to 1919, oats was grown repeatedly before rotation with barley or potatoes, and with no bare fallow. While heavy manuring maintained the fertility, the crop by July was ablaze with corn marigold (and other weeds) through which the thin oats struggled to rear its head. Thickly sown, the return was exceedingly small. Except for the machar (if any) there was no 'out-field' as elsewhere in old Scotland.

The smallness of the crofts and the poorness of the crops explain the very small total return. Hence little oats is now ground for meal and the potatoes do not last through the year, though few are sold. The low out-turn also explains why even fodder is scarce, though much more of the crop is secured for wintering than formerly. Summing up, a croft of 6 acres—though a little too large to be quite typical—includes a couple of acres of grass and hay, almost as much of oats, and the remainder bears potatoes and barley, with turnips, cabbages and garden produce.

311 indication of their worth. As above, the period is *c.* 1937–
511 1938. The Island's increased sheep stock is shown in Appendix II (ii) (a) to 1953.

[233] The Lewis and Harris pastures carry on an average about one ewe to 9 or 10 acres, that is, one ewe or lamb to 4 acres in June (the month of the agricultural returns). A good mainland grazing like Glen Shiel carries one ewe to 6 acres, while poorer grazings like Kintail and Farr carry one ewe to 10 or 14 acres respectively. Nowhere, however, can the rough grazing support the newly weaned ewe lambs (or hoggs) throughout the winter, which have either to be brought to the enclosed 'low ground' (of which there is never enough to supply both grass and winter feed) or sent to the Lowlands in autumn and brought back in spring, at a total cost of about 10s. each before 1939. In Lewis, for lack of grass, there is considerable loss in winter among the crofters' sheep. Constructive measures for the future must be based on an increased supply of winter feed.

137 The game consist of red deer, grouse and hares, while
511 salmon and trout are fished in stream and loch. The deer range over Harris, Park and the Uig hills, but are seldom seen north of Achmore. They are of ordinary quality and size, and before 1939 the average number of heads for the year totalled about 190 stags and 80 hinds. It is not known
[529] when they were introduced. In the south there may be a certain amount of 'deer stealing', as in most deer forests surrounded by crofts, in spite of a score of keepers and deer-stalkers, and other employees at shooting lodges. Grouse are relatively scarce compared with those on drier
[825] mainland moors. Mountain hares have multiplied since their introduction in 1853, when, it is said, the first hare, seen near a village towards evening with its white winter coat, was thought to be supernatural.

361 luck in land, but a disadvantage where control of a single
[423] area is desired by one man. Regularisation of roads,
[182] houses and holdings is relatively modern, for crofts and dwellings were once grouped in hamlets usually close to
[172] the seashore. The early hamlets can still be made out from their ruins among the rocks, sometimes sketched in the 'six inch to mile' Ordnance Survey plans. They were without formal order or arrangement, each homestead within its boundary wall. Where ploughing was and is too difficult, the soil is heaped up in ridges, 'lazy-beds', and dug.

361 Shawbost, on a rocky part of the west coast (six miles
491 south of Barvas) consists of three main sections: a scatter of houses and ruins by the enclosed loch, two main streets linking the loch to the main coastal road, and inland another short street. The three can be made out on a 'quarter-
[175] inch' map. The two main streets were laid out by the
[311] Estate Officers following removals in the mid-nineteenth century from another part of the island, Uig, and the third running inland was laid out still later, when population was growing and land was needed. When the third street was laid out, the landlord, Matheson, lent good plough-horses for preliminary reclamation. The irregularly placed black houses near the sea are tending to be rebuilt close to the main road.

361 In addition to this type of movement, farms 'broken
178 up' once more into crofts have been laid out on a regular
311 grid plan, each house placed on a corner of its five, ten, or twenty-acre plot (*e.g.* Galson, Dalebeg, etc.). 'Skinned'
[654] land may also be reclaimed for crofts by squatters tolerated by the community, or on a regular grid by agreement of the assembled crofters, guided by the Department of Agri-
[491] culture. Thus two distinct tendencies are seen: the grid plan in new settlements, road alinement in existing ones.

present writer) came to the Island in August 1919, and still more by November 1919 when Hardy's Report had been completed. Leverhulme had begun to fight for his plan, rather than use it in a supple way. Yet there was still a chance to put things right had the concept of a balanced community been clearly visualised by Government and people, by working fishers and crofters and the educated. Had an active 'Lewis Association' existed at that time, it might have turned the scales.[1]

Lastly, during the war and after it, Leverhulme had said, again and again, that it was his admiration of the people which had called him to the Lews. By means of this 'all-round' plan, the very root of Island character could have been renewed, namely, communal life. It was with their communal life in mind that Hardy—in spite of his horror of bad husbandry and of the physical dirt of the byre and black house—wrote, first, that "rural re-

[1] Quotations from the MS. Report having been published (apparently without permission, and with somewhat misleading criticisms), reference should be made to these to illustrate the need for survey and collaboration with Leverhulme in the first three years of his proprietorship, and the importance of survey for action today. In 1919 Mr. W. C. Mackenzie (to whose historical researches lovers of Lewis owe so much) had published his belief that "Under the new proprietorship . . . the results [of development] will be at once fruitful and far-reaching", without his making any constructive comment. By 1932 he wrote very differently, criticising Leverhulme's policy and also Hardy's (qualified) approval. At that later time, Mr. Mackenzie would have it that 'the Lewisman' was a crofter and fisherman in one, and that for him to become 'mainly a fisherman' or 'mainly a crofter' (in Hardy's words) would be false to his character and tradition. Now, historically, the element of regional specialisation is ancient in the Island; the crofter-*fishers* of Lochs, Uig or 'the Bays' of Harris have long been rather different from the fisher-*crofters* of Barvas, or of Coll and Gress. Specialisation was strongly marked by 1914–19; it still is. Further, Hardy (and the present writer) had not pled for complete divorce of the two vocations of sea and land. We urged that crofting be given its chance as well as fishing; and that the two callings should be complementary. Allowance being made for a quarter of a century of changes, the facts and the need remain. Cf. W. C. Mackenzie, 1919 (p. 187) and 1932, for the quotations given.

construction of the Island must rest upon the improvement of the land": and secondly, that by this means "it was imperative to revive the traditional community spirit, the essential feature of Hebridean civilisation". Those words still hold good. Yet the land itself is too barren and the soil too poor to provide a living for many by export of fresh agricultural produce to the mainland. Only a local market could pay a fair price for most of the products of intensive small-holding. Judging from the free, untrammelled trade before 1914, Leverhulme held that fishing could be set upon a commercial basis in the Isles; and there could be few better judges of commercial possibilities than this keen industrial thinker and organiser. If he was right, as surely he was, to begin with, then the local market to be created, or rather enlarged by growth of population and prosperity at Stornoway, could have purchased the fresh milk and eggs, the fresh greens and fruit, raised on enlarged small-holdings and marketed co-operatively.

A final comment remains to be made. The community spirit of Scots fishers from Berwickshire to Barra has gone far to make co-operation among the men of the crews a living thing. 'Work for Wages' offered little outlet for this, indeed it virtually suppressed it; and 'co-partnership' on the Port Sunlight model was a very different matter from the co-partnership of a crew. Even if at that time it had been proved impossible to organise free co-operation in fishing, co-operation in small-holding townships might have kept the communal spirit alive, for later renewal at sea.

It is not easy to assess the after-effects of Leverhulme's activity. Leverhulme certainly helped hundreds of families by the provision of wages for the building or rebuilding of roads and other works, of which some were completed

623 The Trustees of the Stornoway Trust have not found
423 it easy to meet the cost of keeping up the valuable property
427 of the Castle and Park, nor to carry the burden of its rates,
178 no adequate income being available for the purpose.
874 Today, however, Leverhulme's gift is being put to good use as a Technical College, opened in September 1952.

• 311 Division of the available farms, after providing about 200 small crofts (of ten acres or so), still left the problem
427 of finding legal homes on legal tenure for the remaining
362 cottars and squatters.[1] The Department of Agriculture
656 arranged to feu plots of 'skinned land' on the outrun of certain townships, including one in the extreme north and others in Lochs. About 200 of these little holdings with potato ground were provided. On the holders' behalf the Department feued land from the owner, after obtaining the consent of the Common Grazings Committee of the township and permission from the Land Court for 'resumption', *i.e.* for enclosure of a portion of the common. The legal and administrative procedure involved may seem disproportionate to the economic value of the holdings. Yet difficulties of law and custom had been allowed to go from bad to worse during the past eighty years; and these difficulties were overcome.

362 To encourage better housing in the crofting counties,
652 loans are made to 'crofters and fishermen feuars' person-
[342] ally. Local stone, or latterly concrete, is used, and much of the building is done by the 'man of the house' himself, and his friends. From 1920 to 1940, nearly 1200 loans were made in Lewis and Harris for the erection (or improvement) of houses, and in a few cases for the erection

[162] [1] Estimated at 1200 to 1500 shortly before, the open question was whether subdivision during the previous eighty years was to be recognised and accepted.

362 of new steadings. The average amount of loans (totalling
652 £166,000) was under £150; repayment has been satisfactory, and the arrangements made by the Department of Agriculture won general praise among the people. Yet 1200 houses were very far from replacing all the 'black houses', and many more are needed.

433 In terms of cash profit, ten crofters today run their
427 crofts less remuneratively than the farmer they dispos-
241 sessed; even together they may show little more total production than the farmer. Nevertheless, these ten crofts each allow a part, at least, of the basis for a country home.
[423] Hence the weight of public opinion supported, nay, insisted
654 on 'giving back' the land to the descendants of those who had worked it sixty or a hundred years before. The State
423 bought the farm stock at a high valuation, and till lately without adequate reform of crofting use and wont. The farms having now been divided, a great emotional issue, which had smouldered for half a century, has been brought to an end. Although the practical results are small, the crofters feel that justice has been done, and that fact may
• 311 be a great gain. Now that there is no more green reclaimed land to be had, the reclamation of the peat moor, or the grey 'skinned' boulder clay has to be faced.

By financing the renewal of Leverhulme's brief attempt to reclaim deep peat on Arnish Moor, south of Stornoway, the Canadian, T. B. Macaulay, made a resolute attempt to
[241] solve the island's main agricultural problem. Good crops were grown, potatoes and silage produced, and a dairy farm established. But the difficulties called for continuity of effort and research. From the practical point of view of 'demonstration' it had been a mistake to tackle deep and almost level peat, black in colour and viscous in consistency.
[487] There was not the light machinery required for cultivation.

311 cottars' claims." Thus a few of the settlements reclaimed
123 out of the common peat by some scores of people, hundreds of years ago, long worked by joint tenants, then by sub-tenants, " and later turned into modern farms, came to be regarded as the only available land open to crofters in the Island ".

311 Hence, Hardy concluded, it was important to tackle
433 some reclamation of peat or of land partially covered by peat, along with the development of the main commercial industry, fishing. The specialisation of commercial fishing was " a wise, indeed an indispensable preliminary step " in a constructive policy framed to deal with the Island as a whole. One saw that the formula " All Lewismen are fishermen " was an exaggeration, and that some of those whose forebears had dwelt by the machars of Broad Bay for centuries were landsmen first and seamen
185 second. Yet the specialisation planned by Leverhulme
311 would not only have given a chance to the seamen of Ness, Eye Peninsula, Lochs and 'the Bays' of South Harris;
133 it would also have begun to relieve congestion, giving a croft and outrun to some of those who wished to make small-holding their principal means of livelihood and life, and providing a market for fresh produce on the Island itself.

Looking back, it seems clear that Hardy was right to report to Leverhulme (in 1919) that, while the great fishery scheme was indispensable, it should be complemented by a scheme for occupation on the land for those who wished it. The major problem of land being the amelioration of peat, continued Hardy, it should be tackled with twentieth-century knowledge and equipment. Slopes were to be found, favourable to reclamation, where peat had been thinned by cutting, where it was shallow from good drain-
33 age, or lighter in texture from admixture with sand. Had

311 womenfolk might wish to keep poultry, and even a cow.
[114] More than this . . . might tend to make the old amphibious life begin over again." Where Hardy went further was to see the need for a complementary policy; the development of crofting into skilled small-holding. "Similarly," he went on, "the development of small-holding, by one who chose the land for a career, should not prevent his spending a leisure hour fishing from the shore, or in a neighbour's boat, for haddock, saithe, or flounders for the morrow's dinner. Yet the wish and need for a higher standard of living involved new emphasis on one chosen vocation, and a greater division of labour than heretofore,"
311 whether on land or sea. Some division of callings already existed, be it remembered. Manifestly, in the virtual absence of arable land for them, about 1500 cottar and squatter families had perforce to depend mainly on other occupations than the land. These families included the keenest, most successful, and potentially prosperous fishermen, like those of 'congested' Scalpay (off Tarbert, Harris). The useful "Remarks" formerly published along with the "Creek Statistics" of the Fishery Board, repeatedly contrasted the townships and creeks mainly concerned in crofting with those mainly occupied in fishing. The contrast is to be found from the Shetlands round to
[159] Barra or Kintyre. Leverhulme, seeing a future in the
[433] fisheries, tried to give the almost landless seamen their chance at sea. Had he accepted the complementary policy of giving a number of the now boatless crofters a better croft and means to improve the outrun, his schemes would have been complete.

114 It is a misfortune that Leverhulme's one-sided policy
159 had already hardened in his mind when Hardy (and the

And when laid down in permanent grass for the dairy herd, the land became water-logged in wet weather. The war called a halt to progress; and though much was learned, the farm was not a demonstration of success. Smaller experiments were made, with some success, in improving 'skinned' land. For both types of land, the cost of fertilisers, even more than of labour, was the chief economic difficulty.[1]

A difficulty which aggravates 'congestion' in crofting townships is that even a small croft may consist of several plots. This was only too well illustrated, as late as 1935, by the dilemma in which a crofter found himself, in a township north of Stornoway. This crofter's land was in at least five separate strips, mixed up with the land of four neighbours. The township and the plan of the holding are known to me. As the crofter complained, he could not walk round his present cottage, nor bring building materials for a new house to the site, without trespassing. He could not even put up scaffolding because the stays at each end would project on to the holdings of his neighbours, who objected. The Land Court has power to re-allocate the land in self-contained holdings. This crofter had twice asked for this to be done, but on each occasion neighbours opposed the application, and it was not granted. As he could not replace his present house by a modern one, he applied to the Stornoway Estate Trustees for another croft in a neighbouring township. When the Trustees saw a plan of the holding they described it as a jig-saw puzzle; but having no holding to offer him elsewhere, they could only ask the Factor to try to make an amicable arrangement with the man's neighbours. This case is extreme; yet it

[1] W. G. Ogg and Angus Macleod, *Scottish Journal of Agriculture*, 1930–36.

311 241 illustrates the narrow margin of habitability on these fragmented holdings.

423 Now, in Lewis periodic pooling and exchange, or the practice of *movable* run-rig on the small joint-tenants' 241 farms, was abolished early in the nineteenth century, except 423 upon the machar, where it still continues. Apparently the 476 strips were simply fixed where they had last been apportioned by lot. Subdivision of the little crofts among sons 178 and grandsons followed, owing to inheritance without re- [175] clamation. Fairness gave 'the patchwork quilt' described; but it was fairness pushed to the point of folly, for differences in soil from one adjacent strip to another were slight! It is otherwise with the long, narrow plough-strips which run from the houses on the pure boulder clay down to the sandy shore: run-rig, movable or fixed, is understandable and necessary there. The case just cited shows how a sensible communal tradition, such as that of '*movable* run-rig' with periodic pooling, may degenerate into absurdity by fixation. Happily the machar still shows the sane maintenance of a tradition, the pooling of resources:[1]

182 In 1924–25, widespread distress in the Isles, the failure 161 of the Leverhulme endeavour, the crofters' refusal to own their own crofts, and the emigration which followed, caused many outsiders to forecast rapid depopulation. It was all 182 the more interesting to note the confidence in the Island's 161 future shown by buyers of the great estate, all of whom 471 knew what they were about, for they were men with experience of the Island, of its rates and rentals and of its people. To a wealthy man who repurchased a sporting

[113] [1] Apportionment of lands held in run-rig in the Carloway estate is described, and the principle discussed, in *Scottish Land Court Reports*. (See *Scottish Law Rev.* vol. 28, 7; July 1940, pp. 51-54.) At the same time 'mechanisation', or the co-operative utilisation of tractors had led to pleas for 'collective farming'. (*Stornoway Gazette*, February 1944.)

458 problem remains that Island seamen may thus continue 746 indefinitely to be crofters receiving partial relief, seamen only in name. Without doubt, part-time work on a croft is socially a lesser evil than prolonged unemployment in a slum or semi-slum. The crofter's family, too, is relatively better reared than that of many a poor seaman in Glasgow, Liverpool or Cardiff. Yet if this were all, it would be no adequate life for a man, while continuing to be an expense [461] to the State. The more satisfactory side of such relief is [311] that the Islanders, when unemployed, turn to building new 'white houses', and either to making small improvements on their crofts, or as in Ness (a progressive village with a high proportion of seamen), to the reclamation of new holdings on 'skinned land'. In all such cases a means test provides against full payment to those who could do without.

458 To women normally employed in 'gutting', unem- 746 ployment relief is given only at such time as there is no work during the season when it might be expected, *i.e.* 462 from May or June to December. Gutters from the Island [228] are busiest for the months from June to August on the West and East Coast of Scotland, and again for two months, from October to November, in East Anglia. The number of Lewis women normally employed was over 1500 in a typical season (1930), the earnings averaging £19 each for the summer fishing in Stornoway, and as much again for the gutting in East Anglia. But the demand fell, and by 1932, for instance, some 250 women were obtaining relief, through Stornoway, in early August, the number doubling during the slack months from mid-August.

181 The tragedy and the danger of any means test are that 458 in effect it asks, not "How prosperous can you become 746 if given help?" but "How poor can you become to qualify

458 How then can the situation be assesse 178 the outbreak of war and since then? By had been partly lost; for the after-war ye hulme boom' were followed by dis poverty. During that time one might ha [423] a generation of reconstruction and progre hand the sore question of dividing the so bringing raiding to an end. Congesti crofts is less than it was, owing to this [166] provision of feus.
